The Nation.

NEW YORK, THURSDAY, JANUARY 3, 1895.

The Week.

THE dissolution of the Government-bond syndicate is announced in terms which may imply merely that the time for which it was organized has expired, or that the speculation has not turned out as was expected, or that the secretary of the treasury has done something in the premises which he ought not to have done. The words are these:

"The action of the United States Treasury on currency questions having stopped progress in the sale of bonds for the account of the 5 per cent. bond syndicate, and the period of thirty days mentioned in the notice of November 2 having expired, the syndicate is dissolved."

The Street has interpreted this as a hint that the secretary has turned against his friends by recommending a measure of currency reform which, if passed, would bring on the market some $200,000,000 of bonds now held as security for national banknotes, thus weakening the bond market and preventing the syndicate from reaping the profit which they had reason to expect. If this has been the effect of the secretary's recommendation, it was unintentional, of course, and in any case it ought not to have been referred to in this public way. The compulsory feature of the secretary's recommendation (the clause which requires banks to take up their security bonds and issue circulating notes on the new plan within a certain time) has been abandoned, and the probability now is that the whole bill will fail, so far as the present Congress is concerned. Therefore, it is reasonable to expect that the price of the bonds will again advance to 119 or higher. But even if it were otherwise, the Government has no bargain, express or implied, to do or refrain from doing anything with reference to a resale of the bonds by the syndicate to the public. Any suggestion or implication of this sort is in very bad taste.

The withdrawal from the Treasury, since the last bond sale was effected, of ten or twelve millions of gold *more* than has been exported during the same time, has drawn attention again to the unstable condition of the national finances, a condition due in part to a deficit of revenue, and in part to the Government's banking responsibilities—*i. e.*, its responsibility for the ultimate gold reserve of the country. It is not unlikely that a new bond sale may be advertised before the present Congress adjourns. That would not be a bad thing. It would put the greenback in a more glaring light than ever, and it might possibly induce Congress to take some step looking to the retirement and extinction of that pestiferous element of our currency. If no such step is taken, and if the withdrawal of gold continues, the President may find it necessary to call an extra session of Congress to relieve the country from the distrust, both at home and abroad, which rests as an incubus on the nation's prosperity. There may be other reasons for an extra session. If the deficit in the revenue continues, it will be necessary to impose new taxes. Nobody can yet say what sum the income tax will yield, or how soon the revenue from sugar will become effective. In the event that both these sources should be disappointing, an increase of the tax on beer would be the most inviting experiment. But in any event the greenbacks must go.

The output of gold continues to increase in the United States as well as in Russia and in South Africa. The *Engineering and Mining Journal* has information which leads it to think that Leadville will become a greater gold-mining than it ever was a silver-mining camp. It is estimated that the Leadville yield for the year will be $2,000,000. The extraordinary showing made in the Little Johnny gold property has been supplemented by "a most important discovery of gold ore in the Triumph shaft on a claim adjoining the Little Johnny on the south." The discovery has greatly stimulated exploration in that quarter. The richness of the South African field has caused a tremendous "boom" in the mining share-market in London, and the rage has extended to Paris and other parts of the Continent. Probably there will be a reaction, and a good many people will get their fingers burned, but the speculation is merely indicative of a large increase of the world's gold production over the extraordinary figures of the fiscal year 1893, which were the largest in the world's history.

The Hartford *Courant*, commenting upon Congressman De Forest's bill making postmasters hold office during good behavior and forbidding removals for political causes, remarks that "the principle is sound, but it is ludicrous to see outgoing Democrats trying, in the name of reform, to tie their men into the places they have turned Republicans out of." It is one of the peculiarities of civil-service reform that every forward step must be taken by the party which has control of the offices, and, human nature being what it is, is most likely to be taken when that control is threatened. The Republicans had been in possession of the entire civil service for more than twenty years, and the Democratic "tidal-wave" of 1882 foreshadowed the change of administration which was decreed by the voters in 1884, when the civil-service law was passed by an expiring Republican Congress early in 1883. The most important extensions of the "classified service" during Cleveland's first administration and during Harrison's term were made after the elections had shown that a change of parties was imminent. As the passage of the original law followed a sweeping political revolution, it would be only natural that the reform should receive a great impetus after another political revolution like that of last fall. One advantage of this method of extension is that it can be effected with but little opposition, the spoilsmen of the dominant party being prevented from grumbling by the notion that they are "tying" their office-holders in—though, as a matter of fact, incompetent and unfit men are less likely to retain place under the merit system than under the spoils system.

The really important thing is to get a general recognition by the public of the fact that "the principle is sound," and progress in this direction is now not only steady but rapid. Business men throughout the country are having the superiority of the new system to the old one brought home to them in a way that makes it impossible for defences of the spoils theory to carry any weight with them. Take, for instance, that demonstration of the value of the reform which Postmaster-General Bissell cites in his annual report from the experience of the railway mail service. It will be remembered that Cleveland issued an order bringing this service under the rules during his first term, but unfortunately so near its end that Harrison could suspend the order until Wanamaker had a chance to loot it. Records are kept of the number of "correct routings" and of errors made by the employees. In 1888 the proportion had been 3,694 to 1; after the Wanamaker sweep, errors increased so rapidly that the proportion of correct routings fell in 1889 to 2,834 to 1. Under the protection of the civil-service law the proportion has risen until in 1893, when no changes were made for political reasons after a change of national administration, the record was 7,144 to 1. In other words, blunders happen less than half as often under the merit system as under the spoils system. There is no arguing against such facts as these, and the Congressman who should now go before the business men of any city to sneer at reform in the Post-office Department would be laughed at. Indeed, the business men of Atlanta, Ga., nearly all of whom are Democrats, recently gave a dinner to the superintendent of the railway mail service for that part of the country, who secured his place under a Republican President.

A late decision of the Supreme Court affirms the constitutionality of a State law

which prohibits the selling of any substance compounded in whole or in part of fats, oils, or any oleaginous material not produced from milk or cream, "which shall be in imitation of yellow butter." There is nothing in the law implying that this is an unwholesome article of food. If the thing is in imitation of yellow butter, not of white butter, it must not be sold. A majority of the court holds that this law is constitutional. Chief-Justice Fuller and Justices Field and Brewer do not concur with the majority. A dissenting opinion is filed by the chief-justice, maintaining that the law in question must be construed according to its natural and reasonable effect, as an attempt to regulate trade between the States, which is the prerogative of Congress solely. As the law in question does not put the prohibition on the ground of public health, but merely on the ground that the article looks like butter, it follows that any State law which prohibits the sale of things on the score of their appearance would be sustained by the courts. Thus the importation of worsteds might be prohibited because they look like woollens, or the sale of oak if it looks like walnut, or of steel if it looks like iron. Especially might all imitations be prohibited, even though the seller should put the word Imitation on them, as they do in the shop windows in Paris.

California is now afflicted with a new apprehension, namely, of being overrun by the Japanese. The new treaty with Japan, which has just been negotiated, gives the people of each nation the right of free entry into the other; and this is declared on the Pacific coast to be the opening of the gates for "a new Asiatic irruption." The San Francisco *Bulletin* says that "there are many people among us who believe that Japanese immigration is more threatening than the Chinese." It is at least a consolation to know that the Chinese bugbear is not so alarming as it used to be. As for the Japanese, it will doubtless seem very heartless to the people on the Pacific coast, but the truth is that the rest of the country cannot easily be excited over this new outcry. Even the professional politicians cannot see any votes in a plank declaring that "the Japanese must go."

It is very melancholy to see the name of Lyman Trumbull attached to a series of Populist resolutions in Chicago, which boldly take the ground that the obstruction of all the great highways of the country last summer as a means of compelling a carriage-builder in one State to "arbitrate" with his workmen, was a rising against "monopolies" which ought not to have been suppressed by the standing army; and that suppressing it and opening the highways was an "oppression of the poor," whom it had thrown out of employment all over the Union. Melancholy, too, is his declaration that it is the duty of the Government to "regulate the value of money," and to coin gold and silver at a ratio of 16 to 1, no matter what the market ratio may be. In fact, nearly every Populist platform is a fountain of despondency for the intelligent lover of his race.

Inspector Williams closed his testimony on Friday, and when he left the stand he "was congratulated by his friends." For what? Presumably because he had not been forced directly to confess acts of criminality. One of the curious things about the Lexow investigation is the frank admission of everybody that the fate of all accused or suspected officials hangs upon the ability of Mr. Goff to prove their guilt. When, a few days ago, the news went over the town that Capt. Schmittberger had confessed, and was giving testimony against Martin and other officials, the usual form of communicating this news was, "Schmittberger is giving away Jimmy Martin." So it has been in all cases. It is never said that a witness is accusing an official, but is "giving him away." This assumption, openly made by their friends as well as their enemies, that they are guilty, reflects the general sentiment of the city. There is not a person of intelligence in the community who has any doubt that most of the inspectors, captains, sergeants, and members of the force have shared in the blackmail collected, and that a proportion of it has gone also into Tammany district treasuries.

The explanation which Inspector Williams gave of his wealth is, like that advanced by all other suspected officials, ludicrously childish. He began his police career in 1866 with $15,000 or $20,000 in a friend's safe, and with a few building lots "in the northern part of Japan"; he has never had since that time a salary of more than $3,500, yet he is to-day worth between $40,000 and $50,000, owns a house in town, a handsome country place, a yacht, has an interest in ship-building in Maine, and lives in the style of a very rich man. The only account he gives of his wealth is that a friend, who was interested in a brand of whiskey which Williams has been accused of promoting, once gave him $5,000 or $6,000 which he had made for him in Wall Street, Williams not investing a penny as a basis for the transaction. He has never, he says, received a penny of blackmail from any source, does not know what a "dive" or a "panel-house" is, and though he has been tried eighteen times by the Police Board, has been charged by a grand jury with many serious offences, has been accused by Mayor Hewitt of others equally serious, and has been implicated as a sharer in blackmail by many witnesses during the present inquiry, he declares that one and all of these accusations are lies and their authors liars. The most remarkable thing about the whole matter is that Williams really believes that he has made a good showing of himself.

After Williams came "Jimmy" Martin, police commissioner, and, though Mr. Goff had only a short session with him, he extracted from him the valuable admission that he was "sorry to be connected with" a department against which such testimony had been brought as this investigation had produced against the Police Department. As for himself, Martin was in complete ignorance of all the blackmailing and other infamous practices till the committee began its work. He had heard more about them before he became a commissioner than he had since. He did not even know that the captains were getting rich. He did know, however, that politics had a good deal to do with the force, and that in making appointments he had given preference to those recommended by his political friends. All witnesses who had testified to his detriment, by showing that he had shared in blackmailing and other crimes, had "lied" in his case as in that of Williams. He could give no reason why the Police Board had not discovered that the "department was rotten all the way through," was frank to admit that it would have gone on in that way if the investigation had not taken place, but was sure that a single-headed control would not be a good thing, "because the man at the head would be so busy that he could not know what was going on." As on his own declaration a four-headed commission had been totally ignorant of what was going on, it is very plain that we must look to other authorities than Jimmy for reform suggestions.

The testimony of Superintendent Byrnes seems to clear him of complicity in the levy of blackmail on the small people of the community, but it opens up another field of abuse which is far more difficult to deal with. A system cannot be sound or wholesome which permits a police officer to accumulate a fortune of $300,000 in a few years through gifts or "points" from rich men. These gifts are made either to get him to do his duty, or to get him to do in his official capacity something which is not his duty. In the first case they must be set down as sheer bribery. In the second the officer, while in the public service, allows himself to be secretly hired by wealthy men to devote to their service powers or talents which he owes to the community. In a great city like New York, rich men are constantly getting into "scrapes" of one sort or another from which there is often no legal escape. The aid of a police officer in providing illegal means of escape, or in using his office to overawe or cajole, is often under such circumstances invaluable. We do not mean to say that it should never be rendered. The scandal

and unhappiness to innocent third persons which some kinds of exposure often cause, are so frightful that a great right may often be purchased cheaply by a little wrong. But no police officer ought to receive enormous fees for any such services. If it is right to render them, he owes them for nothing. If it is wrong to render them, he ought not to render them at all. We do not think we exaggerate when we say that a police officer to whom such chances are open, soon begins to look on his salary with contempt, and that, if he is a superior officer, his state of mind very soon comes to the knowledge of his subordinates, and they learn to cast about outside for additions to their pay. With a captain and inspector making strokes of fortune in Wall Street, through police services, it is almost inevitable that the more stupid or less fortunate fellows should come down on the "madames" and the policy-men.

When we come to talk of a remedy, we confess we are puzzled. All government—at least all successful government—is based on the presumption that the bulk of office-holders will be honest and do their duty. For general dishonesty there can be no legal remedy. Our main reliance in securing public servants must be on *character*. Unless we can get commissioners of police and inspectors and captains who have pride enough and self-respect enough to refuse money for doing their duty, we cannot prevent it by legal penalties only. How, for instance, are we to know for long years that a police officer is growing rich through the favors of Wall Street men, and how can we apply penalties unless we have evidence? This makes care in the work of reorganizing the force of enormous importance. It ought to be commanded by men who care for their reputation, and have been bred in some school of honor and duty, and to whom their social standing is precious. The funny political adventurers who would freely go to jail for $1,000, and would, like Fisk's father, tell twelve lies for a York shilling, with whom we have been filling our "bi-partisan commissions" for years past, must be got rid of, or we shall have in a very few years from this time over again the state of things which we are now deploring. In fact, the "bi-partisan commission" is itself the most fertile source of corruption ever concocted, because it makes responsibility impossible.

Mayor Strong has given us a most gratifying indication of the new era which his administration is to open for the city in selecting Col. George E. Waring, jr., as Commissioner of Street-Cleaning. The shock of an appointment like this to the old-timers of politics must be tremendous. Col. Waring is actually not in politics at all. He is merely an engineer, and one of the first professional sanitarians of his time. No such man has entered the Street-Cleaning Department since its formation. We doubt if in the whole country a man more entirely fit for the position could be found. He was the agricultural and drainage engineer of the Central Park at the time of its construction, served throughout the war with distinction, and since that time has been in active practice as an engineer of drainage, acting in that capacity for various towns and cities. He has had experience in the management of large forces of men, is a born organizer and leader, and has no other conception of public office than to conduct it in the best possible manner. In addition to all these qualifications he is a man in the prime of life, with a vigorous constitution, and a knowledge of men and of the world which will make it very difficult for the politicians either to wear him out or to deceive him. Under his direction the problem of cleaning the streets of the city will for the first time be met in a scientific and thoroughly capable manner, and we can have no doubt of the outcome.

The City Club has made an inquiry into the qualifications of the election officials as disclosed by their records at the last election. It is shown that fully three-fourths of them were incompetent, and that the responsibility for their selection rests upon the Police Board. It is also shown that in other respects the administration of this board in regard to election matters is equally bad, and no one can read the facts brought out by the City Club and escape the conclusion that control of elections ought to be taken away from the Police Department entirely, and placed under a separate bureau, like the present Bureau of Elections, with carefully drawn powers and specified duties. Such separation, in addition to giving us more competent election officials, would take away from Platt-Tammany politicians their last excuse for a bi-partisan police board.

The presidents of Indiana colleges, at their conference in Indianapolis on Thursday, decided to prohibit intercollegiate football contests between the students of the institutions over which they preside. Their action will no doubt cause a great outcry, and they will be called "physical wrecks" and enemies of their race and country; but really they must be regarded as the true friends of football. All they legislate against is the abuses of the game, which its hottest advocates admit must somehow be checked or else the whole thing abolished. Indiana students can play the manly game as much as they choose on their own grounds. They can personally collide day after day with a violence and vigor which will assure even Prof. Richards that they will make good citizens and be the safety of the nation in the next great war. All they are to be prohibited from doing is to furnish a public spectacle of brutality, for glory and gate-money. They can take each other off into private corners of the college campus and "knee" and "slug" each other to their heart's content, but they can no longer plunge the athletic alumnus and their sisters and sweethearts into a frenzy of delight by doing it before a yelling audience at $2.50 per seat. It is perhaps too much to hope that our cultured college presidents in the East should follow the example of these Hoosier schoolmasters, but the least they can do with decency is to confine intercollegiate football hereafter to college grounds. Such a step would itself do away with many of the gravest evils connected with the game, though we believe the entire Hoosier programme will yet have to be adopted.

The dissatisfaction with the young Kaiser seems to find every day bolder expression in Germany. Not only have the Socialists been openly disrespectful to him in the Reichstag, but the Berlin architects have been turning him into ridicule. He has declared himself so dissatisfied with the new Reichstag building that he struck the name of Herr Wallot, the architect, off the list of those proposed for the gold medal of the last exhibition and substituted that of a favorite of his own, Mme. Parlághy. Moreover, he ordered the inscription "To the German People" to be erased from the plan of the building originally submitted to him. The painters have now revenged themselves by making the ornaments at their annual banquet bits of ridicule of the Emperor, his taste, and his musical compositions, and of Mme. Parlághy, his favorite painter. No such demonstration could, of course, take place unless there was a good deal of strong popular feeling behind it. It is a fresh illustration of the difficulty, of which we spoke the other day, of setting up a feudal monarchy with a free press and free parliament in a modern state. The Emperor's notion of himself was always ridiculous. During the first few years of his reign he instructed all the first teachers in Germany in the proper methods of instruction, called a convention to elevate the working classes, and told the soldiers they were to obey only God and himself, or rather God through him, and were to shoot their fathers and mothers if he ordered them. His occasional manifestations of his wisdom since then have been in all respects worthy of the Middle Ages, but he has not until now ventured to dispute the judgment of a profession on the merit of one of its own practitioners. Not only has he given a slap in the face to the architects, but he has also given one to the painters, showing that he considers himself a universal genius. He evidently has Frederick the Great in his mind, but forgets how much the world has changed since Frederick reigned. One of the leading German papers has had the courage to call attention to the depreciatory terms in which the foreign press now speaks of their wonderful ruler.

PLATT AND CROKER.

We presume very few people in this city were aware until recently that "Senator" T. C. Platt worshipped in Dr. Parkhurst's church. To those who knew of it Dr. Parkhurst's recent announcement that one Platt was worse than "five Crokers" was extremely startling, because every one felt that no one was so likely to be acquainted with Platt's moral and spiritual condition as his pastor. In politics, too, it is rare for a man's pastor to abandon him. As a rule, his pastor and his wife stick to him to the last, no matter what the world may say of him. Nay, the cases have not been infrequent where "old pastors," from whose spiritual care he has long passed away, come forward when he is in trouble, to testify to the purity of his character and the nobility of his aims. The abandonment of Platt by his pastor, therefore, was not only an unusual event in the spiritual world, and sent a shock of dismay through the country editors, but it left Platt in a condition from which few politicians have ever emerged with credit. But in America the old proverb, "Never despair," has a force and meaning unknown in older societies. Here pastors come and pastors go, but the sinner flows on for ever. Platt is not a man to be dismayed by the loss of one pastor in a town full of clergy. He promptly found another. He met by luck, at a banquet of the Black Lake Fishing Club, a divine who differs from Dr. Parkhurst *toto cœlo*, as Croker says, concerning Platt's character. His name is Dr. Burrell, and he says Platt's character is as good as Dr. Parkhurst said it was bad. In fact, he said it made "his blood boil" to have any one call Platt a bad man. So Platt has gone to his church.

There is a certain force in Dr. Burrell's objection to having Platt likened to Croker as a man. Individually he has a great many points of superiority to Croker. He has, for instance, a lawful occupation. He has never been accused of murder or other legal offence. He has never fought in the ring, or been a street "tough." He has been respectably brought up, and has received a fair education. His circular to the country editors, if his own, was a composition of some literary merit. Though last, not least, he has a pastor, and is a regular attendant at church. But where Dr. Burrell is in error is in supposing that Dr. Parkhurst, or any one else, just now is occupied with Platt as a man. He is considering him as a politician, or, if any one likes the phrase better, as a "boss." At the same time we admit that a man like Dr. Parkhurst is very unlikely to separate the man from the politician in forming moral judgments about him. He does not believe, any more than Mr. Coudert, in two personalities, one wicked and the other righteous, or in two consciences, one tender and the other tough, in the same American citizen. In other words, one cannot abuse Platt the Boss without casting reflections on Platt the pewholder.

Where Dr. Burrell is in error is in supposing that Platt the Boss differs in any essential particular from Croker the Boss. The great difficulty of the situation to-day is that their view of "politics" is the same, and their methods are the same, and their relation to the Legislature is the same. Both are private individuals, with influence, acquired in various ways, over their party in this State. Both receive money for party purposes in the form of blackmail from individuals and corporations; both spend it without rendering any account. Croker clearly retains a large portion of it for his own private use. Of this we are unable to accuse Platt, but this is the only distinction we can make between them. If Dr. Burrell can get his parishioner to sue us for libel for alleging that Platt exacts large sums from corporations, exactly as Croker does or did, and uses it to retain his control of the Legislature, or, in other words, as a vast corruption fund, we shall be exceedingly obliged to him, and he will do the community a great service.

This control of the Legislature, thus acquired, sometimes by direct donation, sometimes by pecuniary help during the canvass, sometimes by the bestowal of office, is used by both in like manner to maintain their hold on the contributors to the corruption fund. By "owning" the Legislature they are able to threaten the corporations, and by threatening the corporations they are able to retain possession of the Legislature. The possession of the Legislature furnishes a basis for a large number of "deals" with the other side, in which not only are the interests of the community disregarded, but, through the indifference to character and fitness which "deals" always involve, a gentle stream of corruption is diffused through the whole population, which makes it difficult to secure any reform until the abuse gets so scandalous, as in the case of the police, as to threaten the social fabric itself.

We are very sure that most intelligent men in this city who have engaged in reform during the past few months are of opinion that the expulsion of Croker from power is only half the work to be done. The other half is the expulsion of Platt from power and the break-up of the system of management which he practises and represents. It belongs to a much earlier age, and is destined surely to perish under the operation of the secret ballot. But we can ill afford to wait for that. We are perfectly sure that any signs of bossism in dealing with city affairs at this juncture will meet with condign punishment at the next election; but it would be hard to have to sit still till then in order to give Platt a fresh lesson. If, therefore, Dr. Burrell can induce him to abandon the boss business, and either sink into obscurity as an expressman, or else devote himself to the support of the Committee of Seventy, he will not only render a great service to Platt's own soul, but to this long-suffering city. Platt's intelligence is apparently not strong. His present rôle gives him a prominence which he is naturally reluctant to relinquish, and he pays small heed to the arguments of Mugwumps and reformers. But if approached by his pastor on the spiritual side, and made to see the moral splendor of the sacrifice which we ask of him, it might be that scales would fall from his eyes, and the real wrong of his present trade be revealed to him.

SOCIALISM (LIMITED).

The new president of the Federation of Labor, John McBride, signalizes his accession to that office and his defeat of the loquacious Gompers by an interview on wealth and its responsibilities and proper distribution. On this subject every labor leader is expected to have pronounced views. Indeed, the main object of labor organizations nowadays is not, as simple-minded people might imagine, to create wealth by work, but to assist in the correct distribution of wealth already created. McBride announces himself as a "limited socialist." By this he means that he would not have the Government take over immediately all forms of production, but only the railroads to begin with, and then, one by one, such industries "as the people may elect from time to time." "As to wealth," observed the limited McBride, "I think that the time has come to prevent the accumulation of vast fortunes"; and he would prevent it by confiscating them to the state, "and thus back into the pockets of the people."

This explanation of limited socialism seems a trifle vague, but we must remember the limited opportunity offered a philosopher in a newspaper interview. Luckily we find the subject treated in ampler style in a book just published by C. Osborne Ward of the United States Department of Labor. Mr. Ward is also a (for the present) limited socialist. He would have the Government display even an excess of caution in nationalizing industry. He would go so slow that the most timid would not take alarm. Like McBride in this respect, he is unlike him in working out his idea in detail, and showing how at least a beginning might be made. It is this that makes his book worth considering. Most socialists have neither the patience nor the head to picture the actual operation of a Government workshop. To work out the details of all industries in Government hands would, indeed, be a task to make the Prussian General Staff throw up its hands in despair. It is much easier to say that the thing ought to be done, and therefore it can be done; that it ought to work well, therefore it will. But Mr. Ward tried his hand at planning a single Government factory, and this is enough to

make his book notable among socialistic publications.

Another reason for calling attention to it is that its title is such as to hide its great merits, if not its aim and meaning, from the casual and unwary reader. It is called 'The Equilibration of Human Aptitudes and Powers of Adaptation,' and is sent forth with flattering notices from the leading Populists in Congress and influential labor organs. The author himself says it is meant to fill "the gap that yawns between Darwin and the millennium." One naturally looks for a great deal of profound reasoning in a book destined to close so wide a crack, and there are, in fact, 174 pages of it, which those, like ourselves, having no head for metaphysics will be glad to skip and come at once to the practical part. Here we have lucidly laid down the process of acquiring control by the Government of railroads, telegraphs, and telephones. We are to start out by "organizing a thoroughly honest political party." The way to do this is to found it "upon principles" and not "ambition." Having got your honest party, it will be safe to buy up the railroads, though we must say there is a suspicious scurrying over pounds, shillings, and pence just here, equal to that of Dickens's treasurer of a charitable society. But with the railroads once owned, it is certain that there would be no strikes or strikers. "How can the striker wish to destroy that which is his own?"

The blessings which would flow from national telegraphs are in like manner considered mainly as affecting labor privileges. When a great blizzard like that of 1888 cuts off communication between New York and Boston, it would not be the rich alone who could cable to London and thence to Boston, but "the humble citizen" could do the same thing. Prof. Commons has shown how the great beauty of municipal street-cars would be that men out of work could ride up and down gratis in search of a job, and now Mr. Ward points out the powerful inducement to nationalizing telegraphs in the fact that men like Debs could send their labor despatches free of cost, blizzard or no blizzard.

But Mr. Ward is at his best, and is also more original, when on the process of "socializing manufacturing industry." We should "never think of opening a manufactory" on Government account, he tells us, in the hope of competing with others. Such a factory would have "a greater and nobler object than that of paltry gain." The hands are to "work less time and receive a little more pay" than others, and naturally there will be an "annual deficit to pay out of the national treasury for a considerable time." But this need make no difference. The new mills will have a great advantage over competitive factories: "They have no desire for profit." Their only desire is "to supply humanity with pure, honest goods." On the other hand, the competitive mill cares for nothing whatever but profit, and "without profit it will languish and die." In this way Mr. Ward thinks gradually to kill off the competitive mills, even if they do for a time combine in secret against the Government mill, and lampoon and libel that institution devoted to pure and honest goods and the welfare of humanity. But he does not see that the process would be far more summary. Their operatives would all desert them on the spot, and take the first train to Washington to get that less work and more pay. This is an old principle of human nature, especially of labor nature, and would work infallibly. It works even with office-holders. When Amos Kendall and Major Lewis were given two offices by Jackson to divide between them, Lewis was given his choice, and promptly elected to take the one in which there was the least work.

Thus it appears that Mr. Ward has hit upon a greater principle than he is aware of. His limited socialism would run into unlimited socialism in a single day. The great principle of scorning profit and paying the difference out of the national treasury would get universal application the moment it got application at all. Mr. Ward's plan might do away with strikes, as he says it would, but it would bring the entire laboring population of the country in a raging mob about that Government factory where higher pay was to be had for less work. An old-fashioned strike, with all its terrors, would be nothing to that. Socialism, in fact, can never be a limited-liability company. Like the folly with which it is advocated by well-meaning men—and Mr. Ward appears to be a thoroughly earnest and well-meaning man—it must be perfectly unlimited.

CHEAPENING PRODUCTION.

Mr. William Garrett, the well-known inventor, of Joliet, Ill., in a recent lecture stated that wire nails are so cheap that it is estimated that if a carpenter drops a nail, it is cheaper to let it lie than to take time to pick it up, and this might suggest the inquiry whether cheap nails make a cheap carpenter. Mr. Garrett's statement has led the *Iron Age* to do some figuring, with interesting results. Assuming that it takes a carpenter ten seconds to pick up a nail which he has dropped, and that his time is worth 30 cents per hour, the recovery of the dropped nail would cost 0.083 cent. There are 200 sixpenny nails in a pound, and they are worth on an average 1.55 cents per pound, making the value of one nail 0.0077 cent. In other words, it would not pay to pick up ten nails at the assumed loss of time and rate of pay of the carpenter. There could not be a more striking illustration of the results of our industrial conditions: the extreme cheapness of manufactured articles per unit and as measured in terms of labor payments per hour or per day.

In the United States the industrial situation proves that high-priced labor is the most efficient; that the cost of production of large quantities is really less per pound or per yard where high wages are paid and in connection with capital and machinery than where low wages are paid to ignorant laborers. This statement of the philosophy of high wages points the way towards improvement in such of our industries as are now feeling more than ever before the competition with the poorly paid labor of foreign countries. The condition of the farmer in the United States is one which merits the attention of all who are trying to forecast the future. Certainly the prices of the great staples are very low. Whether there is any profit to the agricultural producer at present prices is a disputed question. Farmers are everywhere complaining of the lack of profit, but this of itself is not a good criterion of their condition. It is not many years since it was possible for the New Englander or the small farmer from Europe to take up land in the West at a low price per acre, borrow the greater part or even the whole of the capital required, and by the profit from a few years' crops pay off the indebtedness. That he cannot do this now is not an evidence that farming, even at present quotations for products, does not yield some return on the money invested in farms and farm machinery; for it must be remembered that the farmer needs very little cash except to pay interest and taxes—his living and that of his family being practically assured from his own land. The advantages of house-rent, food, and fuel, which figure so largely in the expenses of the city artisan, are not enough considered by the average farmer when he thinks upon his condition. Yet, when all is said, it must be admitted that the lot of the grower of farm products for export is a hard one.

The attention of the world has lately been drawn to the wheat-grower. In England the profits of wheat production have steadily declined, principally under the competition of American breadstuffs; and it is now America's turn to prepare for the competition of other countries. We have every reason to believe that the world's production of wheat, or at least that portion of it which is sold in European markets, will for a time be large. The Argentine Republic has been increasing its exports of wheat largely of late. There is no reason for doubting that the building of the great Russian railway through Siberia will bring upon the world's markets an increasing quantity of wheat from the fertile lands of Siberia—lands which somewhat resemble the wheat-growing acres of our own Northwest, but from which there has not been until now any cheap outlet. Our consul-general at St. Petersburg says there is a large emigration from Russia to Siberia, where land can be hired at $1.70 per acre, and where laborers receive 15 and 21 cents a day, taking the Russian ruble at its gold valuation. The net return to the farmer in the interior of the Argentine Republic is set down at 37 cents per bushel of wheat in gold,

about the price which our own farmers in Dakota and Minnesota are now obtaining for their grain.

From this brief statement of facts it is evident that the struggle for the wheat markets of the world for the next few years must be one wherein the fittest will survive. Under these circumstances it is important to remember that the growing of wheat, like the manufacture of nails, is not a question of price but of profit. The problem that is set before the farmers and the people of the United States is this: How shall we apply to the staple crops the improvements which, in manufacturing, now allow the outturn of 125 six-penny wire nails for one cent? It must be admitted that the problem is even more difficult of solution in agriculture than in manufactures, yet apparently we have entered upon an era when the question of cheapening the cost of farming must be considered if we are to hold our own in exports against countries whose soil is as fertile as ours, and where labor cheaper than ours, but correspondingly inefficient, is employed. In spite of the improvements in farm machinery, such as in ploughs and mowing-machines, we are still using some methods of agriculture which have not greatly changed since the days of the Pharaohs. For example, farming greatly needs a new motive power. It is possible that this new power may come from the application of electricity in some form to agriculture. If so, we shall see the horse and the mule driven from domestic use on farms just as we have seen them driven from our surface railroads by the introduction of the trolley. The problem of producing our great staple crops at the cheaper cost per pound or per bushel is one of the great questions of our day. It may be that the problem will be solved by the application of other forces than human or animal power, and if so we may assume that it will be in cotton-planting, as it has proved to be in cotton-spinning, that the new methods will demand higher intelligence, and therefore will pay high wages for the laborer, though at a reduced cost per unit of production or manufacture.

The past history of our people warrants the belief that they will meet the new conditions of competition and overcome them by inventions, and in general by the application of brains to their business. Cotton can now be grown in Texas at 2½ cents per pound. Has there been a corresponding reduction in the cost of growing wheat? We have no data for answering this question, but we are confident that there will be such a reduction, since the cheapening of nails and of everything that the farmer buys is *pro tanto* a cheapening of his cost of production.

CHRISTIAN UNITY.

The Paris *Figaro* published, a few days ago, a despatch from Rome to the effect that the Pope was anxious to do in the West what he had just succeeded in doing in the East; and that, with the object of effecting a union of the churches, he intends drawing together at the Vatican a number of Catholic prelates of England and America, in order to confer with them as to the best means of realizing his plan. It was added in this despatch that the Pope particularly desires the advice of Cardinals Gibbons and Taschereau.

The information that the Pope had succeeded in the East in bringing about church unity, or even Christian unity, cannot have failed to astonish profoundly every one who has been following the papal endeavors in that direction. To speak of it as a success is unwarranted by facts; for the truth is that these endeavors have completely failed. Pope Leo's encyclical exhorting the rulers and nations of the world to effect Christian unity by submission to the See of Rome failed to produce any impression upon the Lutheran and the Greek. Then it was proposed to invite the orthodox Greek Episcopate to meet in Rome in order to discuss the question of uniting the Greek and the Roman creeds. This plan had to be given up, as the adherents of the Greek Church showed a very marked disinclination to being absorbed by the Roman Catholic Church. The introduction of the old Slavic liturgy, which was expected to give a mighty impulse to the Roman-Greek propaganda, led, on the other hand, to open mutiny and revolt on the part of Roman Catholic rural communities against their clerical leaders. Consequently the Vatican had to cut down those invitations to the members of the dissenting churches of the Orient, the "Oriental Dissenters," who were to be persuaded into acknowledging the authority and supremacy of the Pope.

But even this programme, minimized as it was, proved impracticable. All the opinions handed down by Eastern propagandists concurred in the assertion that more than individual submissions to the Roman Church could not be expected. Thus the programme had to be curtailed once more; the conference to be held at Rome had to be limited to the question of more closely linking to Rome the Oriental churches which are already united with the papal church. It is generally known that the Roman Church has supported, for centuries, a very active and expensive propaganda in Asiatic Turkey; it is aided, financially and diplomatically, by France since the Turkish sultans accorded to the Frenchmen a protectorate over the Catholics in the Orient. Even the curtailed programme, now almost mutilated into a nonentity, turned out to be impracticable. Of the five Oriental patriarchs, only the Melchitic and Syrian answered the call, whereas the Maronitic and Chaldaic patriarchs sent substitutes, while the Armenian patriarch stayed away; it is said that the Turkish Government prevented him, by main force, from going to Rome. The result of the conferences was absolutely negative. The Oriental dignitaries did not make the slightest concessions; they asserted their full independence; nay, they even demanded the revocation of a certain papal decree concerning mixed marriages. This was the outcome of what the Roman despatch to the *Figaro* calls the "successful" efforts at Christian unity.

This outcome is anything but surprising. The idea of gathering the entire Christian world into one grand body, to bring about a unity of faith and a unity of government, is sublime—too sublime to be realized. It resembles other Utopian fancies, such as the eternal peace and the general disarmament. This opinion is corroborated by no less a personage than Cardinal Gibbons, whose advice, according to the *Figaro* despatch, the Pope is so anxious to hear. To be sure, the cardinal, in his comments on the encyclical, wholly commends the Pope's great scheme; but, speaking of "another cry for unity," that from the Parliament of Religions at the World's Fair, he firmly expresses his disbelief in the possibility "that such endeavors for Christian unity can accomplish their purpose." Such efforts, he says, will not induce the Calvinist to give up his predestination or the Methodist his particular doctrines. The Lutheran will not add to his two sacraments, nor the Episcopalian to his three. The Anglican and the Greek will continue to deny Roman supremacy, and the Catholic cannot be separated from the see of Rome.

The cardinal points out the difficulty of making us "sink our individual differences," and the absence of a bond so strong that "by its cogency it would compel all to put aside their individual conceptions and private opinions, and to accept a common universal creed or formula of faith and a uniform code of morality." Religion consists, as Cardinal Gibbons asserts, not only in charity, but also in doctrines and dogmas; "doctrine must precede practice, principles must precede actions." This point of view accepted, why should it apply only to a "parliament of religion" and lose its argumentative strength with a papal encyclical? The authority of the Pope in religious matters does not extend beyond the circle of his church; the non-Catholics are sharply opposed to the Roman dogmas, while those who have outgrown any kind of dogmas are quite as certain not to submit to the Vatican. To expect a church to submit to, and be absorbed by, a "centre of Christian truths" would be equivalent to asking for its disruption.

The idea of church unity, or, in the parlance of the Vatican, "the return of the prodigal sons to the paternal house," is by no means an invention of the nineteenth century. As far back as the fifteenth century the Roman Church negotiated with the Greek Government and clergy, who, scared by the Osmanic invasion, entreated the assistance of the Pope. But finally, in spite of all endeavors towards unity and reconcilia-

tion brought to bear at the Florence council, the patriarch of Constantinople, the urban and rural clergy, and the monks of Mount Athos declared their preference for the secular yoke of the Turks over the spiritual yoke of the Roman Church. From 1552 to 1560 numerous attempts were made to bring the Protestants back to the Roman fold. Peaceable endeavors failing, the Pope, King Philip II., Emperor Ferdinand III., and the Jesuits found it easier to convert the recalcitrant schismatics after the Bismarckian fashion of blood and iron. The papal church has never for a moment resigned its claim to superior power and primacy, but none of its frequent efforts at establishing this claim has been successful, and the explanation of these failures is given in Cardinal Gibbons's own words, notwithstanding the fact that they were not intended to be applied against that hereditary claim of the Catholic Church.

SOME CONTINENTAL LIBRARIES—IV.

FLORENCE, December 10, 1894.

PASSING over Florence for the present, since our winter's stay in that city would give opportunity for a more extensive acquaintance with its libraries later on, our next bibliothecal visits were to several of the Roman libraries. Of these, we saw the Vittorio Emanuele, the central one of the Government libraries, the library of the Vatican, and the private collection of MSS. and fifteenth-century editions known as the Boncompagni Library. A catalogue of this collection by Enrico Narducci was printed in 1893, and noticed by the *Library Journal* at the time of its appearance. A visit to this library was a privilege I could not have expected, as the villa (the Ludovisi) is entirely closed to visitors this year; but, through the proffered courtesy of his Excellency the Duke of Fiano, I was enabled to spend two mornings in turning over a number of its most curious and interesting MSS. and handling many of its rare editions, as well as to see the "Aurora" and the "Fame" of Guercino, which adorn the ceilings of two of the palace rooms through which we passed.

The Vittorio Emanuele occupies a central position in the building of the Collegio Romano, though its entrance, on a narrow side street, is rather hard to find. The first floor is used partly for the reading, reference, and catalogue rooms, while its collection of several hundred thousand volumes and pamphlets is placed largely on the two floors above. The law of 1873, suppressing the religious orders in Rome, and making over their property to the Government, led to the appropriation of various conventual libraries and to their consolidation under the title of Biblioteca Vittorio Emanuele, and three years later the library was opened to the public, with a collection of 120,000 volumes arranged and catalogued. Of the sixty-nine monastic libraries forming its basis, that of the Jesuits, of 50,000 volumes, was the largest and most valuable. As might be expected from the method of its formation, the Vittorio Emanuele has a preponderance of theological works and a great many duplicates. I was told that there were as many as thirty or forty copies of some works, and I could easily believe it as I looked at the rows of duplicates lining the corridors and occupying the whole of several rooms, both shelves and floor. Order is rapidly being brought out of this chaos, however, and the library intends before long to publish a list of its duplicates, with a view to disposing of them. As there are many desirable and rare works among them, the opportunity will be an interesting one for collectors.

Other prominent features of the library are its collection of Chinese and Japanese books, the cataloguing of which is soon to be undertaken by one of the professors of the University; of Aldines and Elzevirs; of bibliography; and of works concerning the "Risorgimento Italiano," as the gradual emergence of united Italy from its long complication of disorders is called. A fund, formerly of 4,000 lire and now of 2,000 per year, has been provided for the growth of this last collection. Especial treasures of the library are a copy of Petrarch's Sonnets, of St. Augustine's 'De Civitate Dei,' and of Tacitus, all of Venice, 1470, from the press of Vindelinus de Spira. The only palimpsest is one of St. Augustine over Pliny, which is somewhat injured by an unsuccessful attempt to restore the original. A case that especially interested me was one containing old printed copies of pasquinades. A copy of the "Trionfi" of Petrarch contained a curious illustration in xylography, thought to be the earliest attempt at that kind of printing.

Ninety-four rooms of the Vittorio Emanuele are devoted to its collection, many of them, however, being small rooms in which only special collections are placed. Bound periodicals and works in process of publishing have separate rooms assigned them. The usual arrangement of the main library is by form rather than subject-matter. The general reading-room was fairly well filled at the hour at which I visited it, eleven A. M. One of the tables was reserved for women, but was not occupied at the moment. The library has, in all its public rooms together, about three hundred places for readers and students, according to its report of 1893. The periodical-room is devoted entirely to the use of current periodicals, of which 349 may be found in this room. I noticed, among those in English, the *Nineteenth Century* and the *Contemporary Review*. Two hundred and nine periodicals in English are reported as possessed by the library, but as no distinction is made in the report between bound sets and current subscriptions, this number must represent both.

The reference-room is chiefly for professors, literary men, and the more serious class of students. Its shelves are full of works of reference, to which visitors may help themselves, and an attendant is always present to give assistance if needed. Not more than three or four persons were seated at the two long tables in this attractive room, and the perfect silence attested their absorption in their work. The bibliographical room, opening out of this, contained a good working collection of bibliography, including various semi-trade publications. I missed, however, such works as Cushing's 'Anonyms' and 'Pseudonyms,' though the similar work of Halkett and Laing for English literature stood on the shelves. The 'American Catalogue' and 'Poole's Index' with its continuations held a prominent place, however. I have noticed in booksellers' shops here that the 'English Catalogue' and the *Publishers' Circular* seem to be the only source of information as to books printed in English; so that an American book, unless reprinted in England, would be quite unknown to dealers here. When one considers, also, that the editions of American authors chiefly *en évidence* on this side are those of the Tauchnitz Library, under the head of "British Authors," and of the "English Library" of Heinemann & Co., it is not to be wondered at that there should be a certain doubt and haziness in the minds of the Continental peoples as to American achievements in literature.

In the cataloguing-rooms I found exemplified the use of the Leyden catalogue to a greater extent than I had yet seen it. Three rooms are already devoted to the catalogue itself, the walls being lined with the small books containing the cards, while the entrance-room is for the use of persons applying for books. The Leyden books can be opened at the back, and fresh cards inserted in the proper places without difficulty, as most persons familiar with library systems know. The shelves are labelled with syllables indicating the contents of the book standing above each label; and the book itself, with a number indicating its place on the shelves. "But when these books are full?" I asked. "Ah, then," with a shrug, "another room!" And therein lies the objection, not only to Leyden, but to all card catalogues. It was gratifying to see the facility with which people used the system, several men and two women being engaged in consulting the catalogue during the short time that I remained in the room. Having made a list of the books wanted and given it in at the desk, the applicant retires to the reading-room or reference-room, as the case may be, and waits for his books to be brought. If he intends to come in the evening, he must engage his books during the day, as no books are brought from the collection in the evening. This is owing to the difficulty of providing artificial light for so large a building, and to the reduced number of attendants on duty in the evening.

More than 156,000 volumes were given to more than 88,000 readers during the year 1892, from the latest report. For reading away from the library something over 7,000 volumes were lent, while 207 were received from other libraries as loans. When I asked in regard to the method of obtaining books for home reading, the usual reply was given, "There are many formalities to be gone through," and I found, as I supposed, that the rules in force at the library of St. Mark were the same as here. Owing to some ambiguity in the printed rules, I find I minimized the difficulties, in my letter from Venice, in stating that citizens did not require a guarantor in order to draw books for home use. The rule for them is the same as for strangers, except that their guarantor may be any one of a long list of officials named, while strangers are limited to their consul or his representative.

Fifty-three thousand lire was the sum expended on books in 1892. The exchange of Government publications with other countries is a source of growth to the Vittorio Emanuele, and the long rows of our own sheep-bound documents were almost the only American publication of any extent that I observed on the shelves. The library is also one of those designated by the Government as repositories for one copy each of every work printed in Italy. As I made the rounds of the many rooms under the able conduct of Signor Luciani, conservator of MSS., I was continually impressed with the work that had been accomplished in only twenty years in making a well-rounded collection out of such a confusion of material, and in informing the whole with so modern and progressive a spirit.

The Vatican Library, as shown to strangers, is apparently "'Hamlet' with *Hamlet* left out," as, with the exception of a few MS. trea-

sures, shown under glass, there is no collection of books or MSS. visible. But the entire walls of the long rooms traversed are bordered with closed cases filled with *codici*, to the presence of which the custodian testifies by occasionally opening one of the doors. But admission, even to this part of the library, seems to go by favor. One party is admitted, the next is told that the rooms are not open to visitors. On comparing experiences with various other persons, some of whom had and some of whom had not been allowed to enter, we found it impossible to guess at the principle of selection influencing the custodians, and contented ourselves with being thankful that we had been among the elect. Of the treasures exhibited in this part of the library a brief list may be given, little idea as it can yield of the impression made by the sight of them. There were letters written by Luther, by Henry VIII., and by Anne Boleyn, the juxtaposition suggesting the whole drama of the English Reformation; a MS. of Thomas Aquinas; an illuminated sixth-century MS. copy of the 'Æneid'; a copy of Pliny's 'Natural History,' opened at a page illustrated by Raphael; a splendid breviary belonging to Matthias Corvinus, the old book-collecting King of Hungary; the famous Codex Vaticanus; and St. Augustine's Commentary on the Psalms over Cicero's 'Republic'—a most interesting palimpsest.

Fascinating as this part of the Vatican collection is, it was not new to me, and was not the part I was most desirous of seeing, and, after having succeeded in finding the prefect, Monsignor Carini, I had no difficulty in obtaining entrance to the Biblioteca Leonina, as the new part of the library is called. The entrance is through the courtyard of the palace and up two flights of stairs, bringing one to an anteroom lined with portraits of the cardinal librarians of the past, among which are some very fine faces. In conversation with Monsignor Carini, before visiting the library, he remarked that it is only two or three years since it was thrown open unreservedly to students, having been regarded by previous pontiffs as their private library. The alacrity with which the privileges now offered have been seized upon by students from all over the world is very gratifying to Pope Leo and to the entire administration, of which Cardinal Capecelatro, Archbishop of Capua, is the head. The prefect added that women were not yet admitted to the library as students, but I reminded him that Miss Williams, an American woman, had published a year or two ago a study of Raphael's 'Hours' from cartoons found in the collection, through the courtesy of the authorities. He admitted that an exception had then been made, and spoke also of the case of another American woman (Mrs. Nuttall) who had been engaged in the study of some Mexican documents.

The MSS. room, in which students are occupied in consulting various *codici* from the cupboards we had previously seen, is presided over by the Prefect. If printed works bearing on the subject of a codex are required, the student may go below to the consultation-rooms, where there is a card catalogue, find what he wants, and have it taken up to the MSS. room. The library hours are from nine to one until after Easter, then from eight to twelve until July 1st, when the three months' vacation begins. It would not do to stand too long gazing into the Promised Land, already occupied by an advance-guard, and I followed the Prefect to the consultation-rooms, between the MSS. room and the Archives, where two members of his staff succeeded to the task of explanation. In order to obtain space for this library of consultation, rooms formerly used as an armory were taken, provided with an enclosed staircase leading to the MSS. room and with a passage to the Archives, protected against dampness by the construction of vaults underneath, and finally put under the protection of St. Thomas Aquinas by placing here a fine statue of him, a gift to Pope Leo. The Angelic Doctor thus became, to use the phrase of Mons. Ugolini in his interesting brochure on the library, "l'angelo tutelare della nuova biblioteca." The main rooms, seven in number, not including the Archives, are finely lighted, furnished with plenty of tables and chairs, and the books, many of them in new and handsome bindings, render the walls most attractive. Considering that the purchase of books for the express use of students of the *codici* has but recently begun, the collection is already a useful one and of considerable size. An excellent card catalogue has been made and is free to students.

The arrangement of the books on the shelves was peculiar, and offered a new method of "relative location," to use a technical term; but an account of it would be of too limited interest for insertion here. The space nearest the staircase in the library of consultation contains the works likely to be needed by students of *codici*, arranged partly by subject, partly by language, and partly by form; the remaining space being given to works needed by students of the archives, arranged by countries. These consist largely of gifts from the countries themselves, sent in answer to a general notice from the Pope of the projected opening of the library to the public and a request for State publications. England sent the Calendar of State Papers, Chronicles and Memorials of Great Britain and Ireland, Calendar of Documents of Scotland, etc.; but all that can be said of the American section is said by Mons. Ugolini in his brochure: "To America has been assigned a separate section near that of England." Since American scholars, and through them the people at large, have already begun to profit by the treasures of the Vatican Library, does it not seem as if an attempt should be made towards recognition of the fact?

Aside from the library of consultation, there are three rooms in this wing, containing the collections of printed books owned by the Popes previous to the founding of the new library. These are known as the Palatine, the Ara Cœli, the Zelada, and the Mai collections; the last two named from the cardinals who gathered and owned them. New rooms have been provided also for the Archives, and into one of these I was privileged to look through a glass door, with the usual result of seeing darkly. However, it was not the study-room, which is forbidden even to the eye of woman. Is it because women cannot keep a secret? There must be some important ones in all such collections, and there is no telling to what degree of deprivation Eve's unfortunate curiosity may have condemned all her daughters.

Nothing may be removed from the library even to other parts of the palace without the express permission of the Pope, and any one transgressing this rule, or intentionally mutilating a book, document, plate, etc., is subject not only to the legal penalties for such cases made and provided, but to that of major excommunication. From this not even the cardinal librarian would be exempt, should he wilfully err. This is a papal prerogative which many a librarian in our own country would like to have transferable for use in extreme cases in his own library. A telephonic apparatus for use through the library makes the work of administration easier, but seemed almost as incongruous among the *codici* as the little incandescent-wire light which I found in a side chapel at St. Mark's. The quarrel between comfort and convenience on the one hand, and picturesqueness and congruity on the other, is likely to continue, however, during the next century, if indeed all the picturesqueness be not dead long before the century closes.

MARY W. PLUMMER.

PRINCE EUGENE.—II.

PARIS, December 18, 1894.

AFTER the departure of Murat, Prince Eugene assumed the heavy task of representing the Emperor in Germany. He had already many doubts as to the fidelity of the Austrians and the Saxons; he was uneasy about Italy, uneasy about the health of his wife. Marshal Ney, after his great effort in Russia, had left the army; many generals had gone back to France; the troops were utterly demoralized. Napoleon wrote letter after letter urging Eugene to keep and garrison all the strongholds—Cüstrin, Glogau, Spandau; but the Russian armies were slowly advancing, and Prussia was all ready to join their cause. He was fortunate enough, before leaving for Italy, to take part (and a very important part) in the battle of Lützen. Napoleon placed under his orders all the troops which were in Italy and the Illyrian provinces. Eugene left Dresden, stopped a moment at Munich, and six days afterwards found at Milan his wife and his children—Joséphine, already six years old, Eugénie, and Auguste.

Napoleon's position was becoming more and more difficult. Murat was on the point of joining the Allies; the King of Bavaria had already done so, and sent Prince Thurn und Taxis to his son-in-law, offering him, if he would join the cause of the Allies, the crown of Italy—a tempting offer to a man of thirty-two, who must have felt that Napoleon would in the end succumb before the coalition. But Eugene would not abandon the French cause; he refused the proposition made to him. He wrote from Verona, November 29, 1813, to his sister, Queen Hortense (married to Louis, the King of Holland): "An Austrian *parlementaire* asked, at our outpost, permission to hand me very important papers. I had just mounted. I went and found an aide-de-camp of the King of Bavaria, who had been under my orders in the late campaign. He was sent to make me the finest propositions for myself and my family, and the King assured me that the Allies were willing to guarantee me the kingdom of Italy. All this was seasoned with many protestations of friendship. It would have been very seductive for anybody but myself." His wife, Princess Augusta, had ceased to have any direct relations with her own family since Bavaria had declared war against France.

The campaign of 1813 was the closing chapter in Eugene's military career. While some of the Emperor's lieutenants were beaten in Germany, Eugene achieved successes over the Austrians in Italy, and maintained all his possessions. Napoleon, who was fighting in France itself against overwhelming forces, never gave Eugene positive orders to join him in France. The latter was consequently in great embarrassment, as Murat was preparing to take arms against Napoleon. He wrote to the Em-

peror asking for positive orders. Napoleon told him to retreat on the Alps in case Murat should declare war against France. Eugene began at once a retrograde movement, but Murat did not formally come out. The order which Eugene had received was conditional; nevertheless, Napoleon blamed Eugene for not having properly interpreted it. Eugene was very much grieved on hearing of Napoleon's anger. Thiers, in his 'History of the Empire,' says: "Napoleon recalled Prince Eugene to France only at the end of January, when the Prince was engaged in the most difficult operations, and could retreat only after a victory. He could not be in Lyons before the end of March, and at that moment Napoleon must be conqueror or vanquished. [The Allies had determined to make a winter campaign.] Besides, this retreat was the voluntary abandonment of Italy—that is to say, the loss of a pledge which, in the Congress at Châtillon, was to be of the highest value. Though Napoleon was fighting now only for the line of the Rhine, to have in his hands the Mincio and the Po, and to keep them firmly, was a way of making easier the concession of the Rhine by way of compensation."

Napoleon had become so suspicious that he forbade the Vice-Queen to remain in Italy for her approaching confinement; she intended to remain at Monza, but received an order to go to Paris. "I am indignant," she writes to Eugene on the 19th of February, 1814, "and I don't wonder people abandon Napoleon. Could anybody be more ungrateful? You, who sacrifice everything for him, who do wonders, receive only reproaches. . . . But nothing ought to hinder us from following the path of virtue and honor to the last day of our life." She evidently sees the end coming, and speaks of going to America with her husband, for "she is truly disgusted with the great things of this world." It is interesting to find Napoleon, in the midst of his extraordinary campaign in France, marching between Blücher and Schwarzenberg, fighting at Laon, at Craonne, yet finding time to write from Soissons to Eugene (March 12, 1814):

"My son, I have a letter from you and one from the Vice-Queen, both extravagant to the last degree. You must have lost your heads. It was from a sentiment of dignity that I desired that the Vice-Queen should come to Paris for her confinement, and I knew her too well to think that she would like to be in that state in the midst of Paris. I might have written before, but then Paris was threatened; since it is so no longer, nothing is more simple. . . . It is not flattering to our age that your answer to the King of Bavaria should have procured for you the esteem of all Europe; as for myself, I cannot pay you any compliment, as you have merely done your duty, which is a simple thing."

Napoleon had perhaps a right to write in this style to his adopted son, to the man who owed everything to him; he was mistaken when he thought that Paris was safe. Eugene gained a battle over the Austrians under Bellegarde on the Mincio. On the 15th of February, Murat threw off the mask and declared war on France. Fouché had been his counsellor, and had secretly seen him at Modena; Fouché had also seen Eugene. He says in his Memoirs, which are now rare: "Eugene confessed to me that Murat had secretly offered to divide Italy with him, after having sent away the French troops, and that he had repulsed this extravagant offer; that his declaration of war threw him (Eugene) into the greatest possible embarrassment, and that he did not think that he could hold his position long if Murat helped the Austrians with any spirit."

The first successes of Napoleon kept Murat for some time undecided, but after a while his troops advanced. The Vice-Queen was obliged to leave Milan and to shut herself up in the fortress of Mantua, as she was very near her confinement. Soon after her departure, Eugene received the news of the capitulation of Paris. All was now over. Napoleon signed his abdication at Fontainebleau; in this act of abdication he renounced the thrones of France and of Italy, and stipulated in the treaty of the 10th of April that a suitable establishment should be made by the Allied Powers for his adopted son in Italy. The King of Bavaria wrote to Eugene, April 11, 1814: "The Allies wish you well, my dear Eugene." On the 13th of April the Princess was delivered of her fifth child, a princess, in Mantua. What was to become of Eugene? He concluded an armistice with Bellegarde, and made solemn adieux to his French troops, who were sent back to France. He took leave of the Italians, and reminded them that he had been their ruler for nine years; he then left with his wife and children for Munich, where his father-in-law had offered him a shelter.

Eugene, in the new circumstances in which he was placed, found a generous and warm support in the Emperor Alexander of Russia. Leaving his wife and children in Munich, he set out alone for France, at the call of his mother, Josephine. He wrote on the 9th of May to his wife:

"My good Augusta, I arrived this morning at Malmaison very early. I found the Emperor and my sister [Hortense] in very good health. . . . I could not come here without presenting myself to the King of France after an authorization to appear at the Tuileries. Louis XVIII. received me very well, and inquired after you with much interest. . . . But now to our own affairs. We must not expect to be very well treated. They all want to divide the cake among themselves."

Eugene, we must say frankly, falls from his high pedestal of a hero in this new period which follows the abdication of Napoleon. It is said that when he was introduced to Louis XVIII., he was announced as the Marquis de Beauharnais, and that Louis XVIII. interfered and said to his gentleman in waiting: "Say Prince Eugene." The recognition of Eugene as a Prince, the kindness shown to him by the Emperor Alexander, the favor shown to Queen Hortense, who was recognized as Duchess of Saint-Leu, with a pension of 400,000 francs a year, make one think of certain verses which are found in one of Victor Hugo's poems:

"Et battez-vous pour des Altesses
Qui se feront des politesses
Pendant que vous, vous pourrirez?"

Eugene was certainly a good husband and father, and thought much of his family. His fame would have something more poetical about it if he had tied himself body and soul to the man who was his adopted father, and who had lifted him to his own Olympus. We can understand easily what the feelings of Napoleon were when, during the Hundred Days, Prince Eugene remained neutral, and did not join a cause which was thought desperate.

When Josephine died at Malmaison, the Emperor Alexander was at her death-bed with Eugene and Queen Hortense. They buried her in the little church at Rueil, and on her monument may be read these simple words: "À Joséphine—Eugène, Hortense." During the Hundred Days Napoleon paid a visit to Malmaison. Eugene was then at Vienna, where the European Congress had met and was holding its sittings. The Allies only half trusted him, and he writes to his wife that he has spies round him. By the protection of Alexander, Eugene was allowed afterwards to live in Munich with his family, while the castle of Bayreuth was prepared for him. After the downfall of Napoleon he became the Duke of Leuchtenberg. Napoleon mentioned him with affection in his will, and left him the golden candlestick which he used at Saint Helena. Eugene lived now entirely for his family; he had in his palace a room in which he preserved carefully all the objects which Napoleon had given him.

Prince Eugene died on the 21st of February, 1824. His monument, in white marble, was made by Thorwaldsen, and on the cross which surmounts it were engraved the two French words, "Honneur et fidélité." His eldest daughter, Joséphine, had become in his lifetime Queen of Sweden. Two years after his death, the second daughter, Eugénie, married the reigning Prince Frederic of Hohenzollern-Hechingen; the third became the wife of Dom Pedro, Emperor of Brazil. His eldest son, Auguste, married Doña Maria de Gloria, Queen of Portugal, but died of consumption at the age of twenty-four. The second son married the daughter of the Emperor Nicholas, the Grand Duchess Maria of Russia, and was made Imperial Highness. The son of this Duke is the present Duke of Leuchtenberg.

Correspondence.

CURRENCY REFORM.

To the Editor of The Nation:

Sir: May I break silence so far as to give expression to reflections which I hear on all sides?

Mr. Carlisle has prepared a bill which involves nothing less than a revolution in our whole system of currency. Why should that bill be left to find its way to Congress through the roundabout channel of a standing committee? Why should the conduct of that bill in the House be left to Mr. Springer, member from a district in Illinois, instead of the responsible head of the national finances? Why should the debate proceed from the point of view of local, party, and private interests, without the intervention of any person representing the whole country, the administrative system, or the Treasury? Why is the Secretary of the Treasury confined to buttonholing members or dancing attendance in the lobby?

If Mr. Carlisle could stand up before 356 men and show the country that he was master of his subject, had thought out and was prepared to meet every objection and argument, his bill probably would (and there would be good reason why it should) pass into law. If, on the other hand, he was brought to confusion and self-contradiction, showing both ignorance and incapacity, the President would be obliged to accept his resignation and take some other man—probably that member of the party who had shown himself strongest in debate, and who would gladly resign his membership for the honor, even though the chances were of his speedily losing both and being sent to join Mr. Carlisle. By and by a man would appear who could hold his own against all comers, precisely as if the object sought were a champion billiard-player or prize-fighter, and then the applause and outcry of the whole country would compel Congress to adopt his views.

All this seems so simple and obvious that most people conclude that there must be some

fatal constitutional objection. There is none at all except the obstinacy with which Congress clings to its usurpation of all the powers of government. The 356 equal members don't want to see anybody admitted who holds a place superior to theirs; to give the executive any share in the Government except that of a blind instrument to carry out their commands; to see any body representing the interest of the whole country coming to interfere with the private schemes and party combinations which are their very reason of existence. The fact will have to be faced that the interest of the country and the interest of Congress under its present methods are diametrically opposed. The greatest political problem of the future, far overshadowing in importance the currency or the tariff or civil-service reform, is which of these interests is going to prevail.

If the President would send a message to Congress asking that the Senate committee report of February 4, 1881, should be put into practice, or even that the Secretary of the Treasury should be allowed to develop his plans in public debate in the House, he would do the country a political service such as no President has done since Abraham Lincoln. If Congress was still sulky and obstinate, what finer issue could there be to take to the country in the next Presidential campaign? G. B.

Boston, December 22, 1894.

EXPLORATIONS IN CRETE.

To the Editor of The Nation:

Sir: Prof. Halbherr returned to Rome this week after an absence of an entire year in Crete, where, as is known to many of your readers, he has been engaged in archæological work for the American Institute of Archæology. I have had the pleasure of examining some of the objects found, the drawings of many others, topographical plans of several ancient sites that have been carefully studied, and the copies of some two hundred inscriptions found; and I feel fully justified in saying that the results of the year's explorations are greater than have ever before been secured by any archæologist in Crete, except by Prof. Halbherr himself in his earlier labors, and even these are surpassed by the variety of the present harvest and by the lapse of time over which it extends. His inscriptions form a series from about six centuries before Christ on to Christian times, while the other objects go back to the second millennium before our era and close with imperial Rome. Those who have looked to Crete as a necessary factor in the solution of the question of prehistoric Greece and the early civilization of the Levant will find here much food for study and comparison.

A short résumé may be of interest. Among the vases from various sites, those of the so-called Theran type appear to be the earliest; then follow the Mycenæan, in varying stages, from the earliest till they mass into the geometric style and advance towards archaic Greek. Some of the terra-cotta statuettes present a peculiar stamp which Prof. Halbherr inclines to assign to the Eteocretans; others repeat the well-known attitude of the Cypriote goddess. A number of steatite stones, apparently employed as amulets, are of an extremely archaic cast, and some of them are incised, on one or more faces, with figures and marks, which will be studied in connection with the theory of a prehistoric hieroglyphic and syllabic system of writing in Crete. These stones were employed also in the historic Greek epoch, and some specimens are thought to be Gnostic. The question of burning and of inhumation in the Mycenæan period gains evidence from both sides. At Erganos, in the beehive tombs, inhumation was alone employed; elsewhere incineration was found to be usual. On two sites it was possible to discern the remains of the Mycenæan palace, though the interior plan was hardly to be traced.

Among sculptural remains are several important pieces from Gortyna, metopes of different epochs, a noble head of a goddess, and some heads of distinguished Romans. Two terra-cotta heads are of great beauty, and a relief of a dancing girl, with a somewhat novel motive, is very charming. Some other specimens are not without interest.

No inscription of great length, like the famous Code of Gortyna, has rewarded the explorer's efforts, but many are of great value from the epigraphic and dialectic point of view. Gortyna has yielded a number, of the archaic boustrophedon epoch, from the period of the closed *eta* onward, and one is boustrophedon in the Ionic alphabet. They represent decrees, laws, treaties, etc. The Macedonian has a notable series, one of which gives a fixed date (so rare in Cretan inscriptions) in the reign of Demetrius Poliorcetes. The most important belonging to the Roman days is a Latin rescript, which will be edited by Prof. Mommsen, who has taken great interest in it.

Prof. Halbherr's explorations have covered two-thirds of the eastern part of Crete, embracing twenty-one journeys from his headquarters at Candia, so that he may be said to have garnered the harvest there of archæological material so thoroughly that systematic excavations will next be necessary before much further advance can be made.

Dr. Taramelli, a pupil of Prof. Halbherr's, was of great assistance to him in the early summer, after which he travelled in western Crete until he was attacked by a fever that prostrated him completely, and he was sent home. He has now so far recovered that it is expected that he will be able to contribute an article on early pottery to the publication to be made by the Institute.

Prof. Halbherr is to be congratulated upon the success that has crowned his labors, in the midst of enormous difficulties, which he has surmounted with rare patience and sagacity. Among his other services, epigraphists will thank him for the cast which he has had taken of the great Gortynian inscription, thus securing a permanent record of it, even should the original be destroyed. A. C. Merriam.

Rome, December 6, 1894.

A CHAPTER OF ALASKA.

To the Editor of The Nation:

Sir: In the *New England Magazine* for January, 1895, appears a most grotesque "Chapter of Alaska"; it is not only grotesque, but the writer of it has been shamefully imposed upon, for no sane man, knowing the history of Charles Bryant, would attempt to place that person in the position which the author of this article does.

In the first place, Capt. Charles Bryant never placed his foot on Alaskan soil (nor did he ever see more of it than its shadowy outlines from the deck of a whaling vessel in the North Pacific Ocean) during the two or three cruises made in those waters, in which he sailed from Honolulu for sperm and right whales, as a ship's mate; he never commanded a whale ship in his life; as a ship's mate it was his duty every day on the cruise to enter in the log those notes of weather, whales, etc., which the owners of all whale ships required.

His first personal knowledge of the Alaskan country was gained in 1869, when he went up to that region as a special agent of the Treasury Department, in company with one Dr. H. H. McIntyre, also a special agent. These gentlemen were sent out by the Secretary of the Treasury to look into the state of affairs on the Seal Islands, which had been badly stirred up in 1868 by some greedy Americans, who threatened to exterminate the fur seals. Neither Bryant nor McIntyre knew anything about these seal islands of Alaska until they heard of them in the fall of 1868 from these American adventurers, who came down to Washington to try and get some special control of the life thereon through Congress.

These two men, Bryant and McIntyre, made their reports in the fall of 1869. These reports were not the result of any study of the seal life, but all that related to that subject in both of them was founded on a translation of Bishop Veniaminoff's account of the islands published in 1842 at St. Petersburg, which translation was read to them on the islands by a Russian Creole who had been in the service of the old Russian Fur Company.

McIntyre reported in favor of leasing the islands, and, immediately after that, resigned his position in the Treasury and entered the service of the men who were then in Washington striving to get the lease law of 1870 passed. Bryant did not so report, because Boutwell, the Secretary, did not want to have these interests of our people so leased to a private corporation. Bryant preserved a discreet silence during the contest between the Secretary and the would-be lessees, which ended in the defeat of the former; then Boutwell sent Bryant up to watch these bad men, and McIntyre in especial; and he stayed there just as long as he could stay—seven years—until Bristow removed him. Now the author of this "Chapter of Alaska" tells the readers of the *New England Magazine* that, upon the flimsy notes of whales and weather in the North Pacific made by Charles Bryant, a totally illiterate man, the argument of Charles Sumner was made in favor of the purchase of Alaska! Why, there were at that hour hundreds and hundreds of such log-books, and their writers all within reach and hail, between New London and Provincetown.

This article may have been written in good faith by Mr. C. E. Cabot; but there is scarcely a paragraph in its composition which relates to Charles Bryant that is not wholly if not partially untrue, and to those who remember Bryant in Alaska during 1869, not a line that does not provoke their mirth.

John W. Bingham.

New London, Ct., December 28, 1894.

NOBLESSE OBLIGE.

To the Editor of The Nation:

Sir: I do not know whether you have received the thanks of many of those who are especially interested in collegiate education for your vigorous condemnation of the spirit among faculties and students which makes the present abuses in athletics possible. You at any rate deserve the gratitude of every one who believes that the most necessary outcome of a young man's education, without which all else must be "as sounding brass or a tinkling cymbal," is that spirit which makes him fear to do anything and everything to secure

victory, and gives him the ability to accept defeat quietly when victory cannot come to him through superior skill. It is a lack of the capacity for moral scorn which is really at the root of the trouble. This is clearly seen by your correspondent "A. H.," in No. 1537 of the *Nation*, and I dare say that, like myself, many a college professor could give other instances to parallel those which he has adduced.

But the fault is by no means entirely on the part of the students. It is not easy to make all college presidents and professors perceive that it is a serious moral offence for a base runner to skip "second" or "third" when the umpire does not chance to see him, or for their own "nine" or "eleven" to smuggle in an expert player who is not really a member of their college. On the part of older men this obtuseness may arise from a lack of familiarity in their earlier years with good sport, and a consequent ignorance of the principle that sport ceases to be sport when it involves any evasive or ungentlemanly conduct. Of course, too, the unfortunate competition for students between many of our colleges furnishes a temptation to overlook secret offences, and makes anything but concerted action on the part of the faculties to remedy these abuses extremely difficult. Hence, like "A. H.," every one hears, "They all do it if they can." In regard to these violations of the spirit of good sport, I believe the lack of moral sensitiveness is less common among our younger teachers, and, if this be so, there is hope that a higher tone in athletics may gradually come to prevail. At present, however, there is a crying need in our education of *noblesse oblige*.—Yours truly, X.

USE OF THE WORD "SPINSTER."

To the Editor of The Nation:

Sir: The following is copied (in response to "A. D. H.'s" inquiry in the *Nation* of December 20, 1894) from the British *Historical Manuscripts Commission Report*, No. 10, appendix, part iv., at page 468:

"Entertaining evidence respecting an obsolete use of the familiar word 'spinster,' that has hitherto escaped the curiosity and vigilant inquisitiveness of our antiquaries. There is no need to remind the educated reader of the etymology of the designation that has long been regarded as applicable only to unmarried women of the lower social grades. Every one is aware that, so long as the spindle ranked with the spear, 'spinster' was the appropriate designation of gentlewomen whose knightly brothers were no less generally described by a title pointing to their dexterity with the lance or the sword. Every one knows how Sir Henry Spelman, in the 'Glossarium Archæologicum,' accounts for women of the nobler sort being described as 'spinsters' in legal documents, and how the famous antiquary commemorates the knight who caused his eleven sons and eleven daughters to be painted upon his tomb, the men girt with their swords and the women represented with their spindles. No less generally is it known that, when the familiar designation of a gentlewoman, the old equivalent of the Latin 'generosa,' was falling out of fashion in James the First's time, Chief Justice Coke robbed the time-honored term of its ancient dignity, and quickened its downward course from the gentry to the populace, by declaring authoritatively: '*Generosus* and *Generosa* are good additions; and, if a gentlewoman be named spinster in any original writ, etc., appeale, or indictmente, she may abate and quash the same; for she hath as good a right to that addition as Baronesse, Viscountesse, Marchionesse, or Duchesse have to theirs.' But what few people know, what most readers—probably every reader—of this page will learn from it for the first time, is that Elizabethan gentlewomen in some parts of England were too proud of the homely designation to relinquish it on marriage, and that it was the practice of legal draughtsmen to apply the term to married no less than to unmarried gentlewomen. In the presentments (23 Elizabeth) of persons of the age of sixteen or upwards, for neglecting to attend church or chapel, the searcher of the Essex muniments comes upon the names of the following ladies, as spinsters *and* wives:

"(1.) Margarett Tirrell, spinster, otherwise styled Margarett Tirrell, wife of Thomas Tirrell, esquire (the words of Latin record being Margaretta Tirrell, spinster, *alias* dicta Margaretta Tirel uxor Thome Tirrell armigeri).

"(2.) Mary Gascoigne, spinster, otherwise styled Mary Gascoigne, wife of George Gascoigne.

"(5.) Katherine Mompson, spinster, otherwise styled Katherine Mompson, wife of . . . . Mompson, gentleman.

"(8.) Maria, Lady Petre, spinster, otherwise styled Maria, Lady Petre, wife of Sir John Petre, of Westhorndon, knt. (the words of the Latin record being alias dicta Maria domina Petre uxor Johannis Petre de Westhorndon predicta militis).

"(9) Edmund Danyell, esquire, and his wife, Margarett Danyell, spinster.

"Sometimes in these presentments women, described as spinsters, are described also as wives of men respecting whose calling and quality there is a significant silence. In other cases the spinsters are described as the wives of men who are described in terms leaving no room for doubt they were not of rank to impart gentility to their wives. The presentments also abound with cases of women, married to yeomen, mechanics, tradesmen, labourers, and other persons of ungentle quality, who are described as wives without being at the same time styled spinsters. It follows that gentle wives of ungentle men held to their right to be styled spinsters, as an indication of their gentility by birth; that so late as the twenty-third year of Elizabeth 'spinster' was the English equivalent of the Latin 'generosa.' But already the worshipful designation had lost much of its ancient force, and though not fallen was falling into disrepute. In the following reign and generation, Coke's dictum so effectually degraded the name from the dignity accorded to it by the usage of successive centuries, from the days of Alfred to the days of Elizabeth, that Thomas Blount (author of the 'Glossographia or Dictionary of Hard Words,' 1656, and the 'Law Dictionary,' 1671) knew nothing more of the word, apart from its etymological force, than that it was 'the addition usually given to all unmarried women, from the Viscount's daughter downward.' On ceasing to be a sign of gentility, the designation was dropt by gentlewomen on marriage even if they had borne it in their maidenly estate. On becoming merely the equivalent of 'single woman' it was held full cheap by women of all grades, whether matrons or maids.

"I am at the more pains to call attention to this recovery of a long lost signification of the word 'spinster' because it is something more important than a mere antiquarian curiosity. It has for so long a time been the practice of genealogists, and other serious historians, to regard spinsters as necessarily without husbands and lawful issue, that it is well to assure them spinsters could also be matrons and mothers in the sixteenth and earlier centuries." * * *

Richmond, Virginia, December 22, 1894.

Notes.

A memoir of the late Dr. John Lord, the historical lecturer, is in course of preparation by the Rev. Alex. S. Twombly, D.D., of Newton, Mass., who desires the loan of letters and other material for his purpose.

A committee of Harvard alumni has been formed to establish a suitable memorial of the late Dr. Andrew P. Peabody. Subscriptions of ten dollars or less will be welcomed, and may be sent to the treasurer, Mr. Amory A. Lawrence, No. 68 Chauncy Street, Boston.

The twelfth General Centennial Catalogue of the Alumni and Officers of Columbia College forms a volume of 620 pages, octavo, and in addition to the customary matter of such documents contains a Locality-Index, alphabetical by States or countries and places, revealing the whereabouts of more than 8,000 living alumni. These addresses are first given in connection with each name under the several divisions of graduates—arts, medicine, law, mines, political science. A labor so great and so disinterested will not fail to be appreciated by the great body thus brought in touch with one another, as well as by a much wider circle of friends and associates who lack the college tie. We ought also to mention the condensed biographical data as more extensive than ordinary. The Catalogue is sent postpaid on receipt of a dollar for paper copies, or a dollar and a half for cloth-bound, by the committee, Prof. J. Howard Van Amringe and John B. Pine.

Macmillan & Co.'s announcements for the opening months of the new year embrace a "Rural Science Series," edited by Prof. L. H. Bailey of Cornell; 'The Aims of Literary Study,' by Prof. Hiram Corson of Cornell; 'Mental Development in the Child and the Race,' by Prof. J. Mark Baldwin of Princeton; Borgeaud's 'Adoption and Amendment of Constitutions in Europe and America,' translated by Prof. C. D. Hazen of Smith College; 'A Student's Manual of English Constitutional History,' by Dudley J. Medley; 'The Life and Letters of R. W. Church, Dean of St. Paul's'; 'Summer Studies of Birds and Books,' by W. Warde Fowler; 'Alexander III. of Russia,' by Charles Lowe; a 'Life of Adam Smith,' by John Rae; Paulsen's 'Character and Historical Development of the Universities of Germany,' translated by Prof. E. D. Perry of Columbia College; Rätzel's 'Völkerkunde,' translated by A. J. Butler, in three volumes, illustrated; and 'Rational Building,' the article *Construction* translated by Geo. Martin Huss from Viollet-le-Duc's 'Dictionnaire Raisonné de l'Architecture Française.' Just ready is Plato's 'Republic,' edited by the late Prof. Jowett and Prof. Lewis Campbell. The third edition of Mr. Bryce's 'American Commonwealth' is to appear next week. Noteworthy also is "a series of reprints of famous works of fiction which may fairly be considered to have taken an established place in English literature," each to contain "a preparatory notice written by a critic of distinction," and about forty full-page and other illustrations. Maria Edgeworth's 'Castle Rackrent' and 'The Absentee' head the list.

W. B. Clarke & Co., Boston, are putting out the *Aeronautical Annual* for 1895, edited by James Means, with many curious illustrations.

'American Charities,' by Prof. Amos G. Warner, is in the press of T. Y. Crowell & Co.

'The Evolution of Modern Capitalism: A Study of Machine Production,' by John A. Hobson (London: Walter Scott; New York: Scribners), is a labored defence of state socialism as a phase of the evolution of society. In fact, the author maintains that those who protest against the increase of governmental control over industry are bringing "an indictment against a natural order of events, on the ground that nature has taken a wrong road of advancement." It is obvious that this principle involves many important, not to say extraordinary, consequences, which it is unnecessary to specify. Although argument of this kind can hardly be taken seriously, yet there is a great deal in Mr. Hobson's essay that is suggestive and interesting, and many of the secondary results of the application of machinery to production are impressively stated. Especially noteworthy is the analysis of the

waste involved in competition, on account of the excessive increase of the means of production.

Less deserving of attention is Mr. J. Stephen Jeans's 'Trusts, Pools, and Corners' (London: Methuen & Co.), which, indeed, contains little more than is known to any diligent reader of the daily newspapers, and is, so far as concerns our American combinations, very much behind the times.

A convenient and useful as well as timely little book is 'The Federal Income Tax Explained,' by Messrs. John M. Gould and George F. Tucker (Boston: Little, Brown & Co.). The authors start from the fact that the phraseology of the law of 1894 follows wherever possible the language of the similar statute of war-times. As the words, phrases, and clauses of the latter have been passed upon and settled in meaning by the courts, the utility is obvious of a collection of nearly two hundred of the cases in which the terms of the law were brought up for adjudication.

'Electricity at the Columbian Exposition,' by J. P. Barrett, Chief of Department (Chicago: R. R. Donnelly & Sons Co.), which is prefaced by a full-page portrait of the author, does not claim to be more than a compilation of the circulars of the exhibitors. It is profusely illustrated with photogravures of electrical apparatus which give one an excellent idea of the external forms of electrical machinery exhibited at the Fair. The scope of the book did not permit of the introduction of diagrams and representations of electrical connections which might be desired by the student. The author calls attention to the remarkable fact that all the lighting of the Columbian Exposition, for decoration as well as for service, and the operation of all machinery, was done, for the first time in the history of expositions, by electricity.

Mr. William Arthur Price, in his useful 'Treatise on the Measurement of Electrical Resistance' (Oxford: Clarendon Press; New York: Macmillan), points out that the measurement of electrical resistance bears a relation to electricity analogous to that of the comparison of masses in quantitative chemistry. Mr. Price has had a large experience in the construction of resistance coils, and his treatise contains the results of his experience in winding, insulating, measurement of temperature coefficients, and calibration of coils. English forms of resistance-coils and boxes and measuring instruments are given, to the exclusion of German and American designs. The rapid development of practical applications of electricity has led in America to the improvement of many forms of electrical measurement apparatus. In a new edition it would be desirable to mention Weston's ammeters and voltmeters, Prof. Anthony's arrangement of coils in a resistance box, and Prof. Carhart's modification of the Clark cell. A full index would increase the value of Mr. Price's work.

A notable contribution to the scientific study of forestry is Somerville's translation of Prof. Robert Hartig's 'Text-book of the Diseases of Trees,' revised and edited by Dr. H. Marshall Ward (Macmillan). Hartig has been studying the diseases of trees for more than twenty years, has published a good many papers on the subject, and has at last produced the systematic treatise of which the present volume is a translation. The diseases of trees are here classified as (1) those produced by flowering plants, (2) those produced by cryptogams, (3) such as result from wounds, (4) those due to unfavorable conditions of the soil, and (5) those due to unfavorable atmospheric conditions. Fully two-thirds of the book is devoted to diseases caused by fungi, and about forty-five pages to wounds, only two pages of which are occupied with a consideration of defoliation of trees by insects. Injuries from sun-cracks, from frost, and from fire are duly considered, and the work closes with a classified list of diseases. It must be remembered, in using this book, that it deals mainly with European trees and their diseases, and that it is altogether probable that in America, as we have our own silva, so we may have some of our own diseases which affect our trees.

Under the title of 'Les Merveilles de la Flore Primitive' (Geneva: Georg & Co.; Paris: Georges Carré), M. A. Froment gives a discussion of the probable character of the vegetation of the carboniferous age. He speaks familiarly about the carboniferous ferns, calamites, lepidodendrons, etc., and tells us that the richness of the soil at that period furnished the primitive flora with mushrooms at least forty feet in diameter! He reasons from the rate of sedimentary deposit of the Nile that, to produce a coal-bearing formation of only two thousand metres, a period of 980,000 years must be allowed. The connection between the delta of the Nile and the coal-deposits of Europe and America is not very clear; but the process of argument may perhaps be guessed at by reading later on in the same pamphlet a little essay, in which is a discussion of the Australian continent considered (hypothetically, of course) as a fallen meteoric mass! "Little by little, as the weight and volume of the planets increase, their equilibrium is disturbed, and in the course of time, after milliards of ages, the face of our solar system will be changed." The sun will gradually grow cold, the swollen planets will circle round it with whirlpool speed, and the smaller will become the prey of the larger. "Quel épouvantable cataclysme!"

M. Paul Stapfer has written the latest study of France's great moralist, 'Montaigne' (Paris: Hachette), and, as might be expected from the writer and the subject, the result is most satisfactory. The book reads well, a prime requisite in a volume treating of so easy and fascinating a *causeur* as Montaigne. The moralist is studied from as unconventional a point of view as possible; M. Stapfer desiring not to reproduce and perpetuate the legends current about Montaigne, but to present as real and faithful a portrait of the man as is possible nowadays. That Montaigne was something more and something else than the lazy and selfish sceptic that most people see in him, is what M. Stapfer sets out to prove in his two hundred very interesting pages. And that the complex nature of Montaigne, which has baffled and misled many a critic, is, on the whole, well and clearly analyzed in this book, that the man is better revealed, that his work is more readily understood, is the best testimony one can bear to the excellence of M. Stapfer's conscientious and able study.

M. Georges Pellissier's 'Nouveaux Essais de Littérature Contemporaine' consists, with the exception of the essay on Vigny, of a number of reviews of works no longer recent, by Zola, Bourget, Loti, Lemaître, and some others. The article on Vigny is a discussion of Brunetière's lecture in his course on the evolution of lyric poetry in France in the 19th century. This is by far the most interesting essay in the book; its more general character gives it a value which the review of specific works lacks.

Two capital novels come from the press of Paul Ollendorff, the one 'La Chevelure de Madeleine,' by M. Jean Rameau, the other 'Un Roman de Femme,' by M. Pierre Maïl. Both may be read in the home circle, both are interesting and even fascinating, full of the pure breath of nature, clean, and free from the exaggeration of psychological analysis so much in vogue among certain writers. M. Rameau takes us into the heart of the Pyrenees, and introduces us to an abbé who is not a saint, but a mortal, a charming girl who knows her own mind without subtly questioning it, a frank young fellow who is neither wholly good nor very bad, and a curious study of a peasant sorcerer. M. Maïl's story is of the Breton coast and its wild storms, and the contrast of the struggle in a man's heart against a love which he ought to yield to at once. There are superb descriptive pages in both books—sea and mountain charm equally.

Part viii. of the "Anecdota Oxoniensia" (Oxford: Clarendon Press; New York: Macmillan) entitled 'Hibernica Minora,' is edited by Kuno Meyer. Its contents are motley enough. The first section, pp. 1–37, consists of a fragment of an Irish commentary on the Psalter. The manuscript is probably of the fifteenth century, but the original of which it is a corrupt transcript may have been composed in the eighth century. Meyer gives the Irish text, with variants; also a translation, notes, and glossary. In substance, the commentary is based upon the well-known writings of Hilary, Isidor, Bede, etc. The doctrine does not differ from that of the early mediæval church. A goodly number of Old Irish forms are discernible under the scribal garb of the fifteenth century, but there are scarcely any "finds" for the etymologist or grammarian. The rest of the volume is of an altogether different order, being stories—or fragments of stories—of the great Ulster-Leinster cycle. To the reader who is familiar with Irish myth, the present collection does not offer much that is new. The most characteristic story, that of MacDáthó's Pig, is a variant of an older version in the Book of Leinster.

Part vii. of the "Anecdota" is remarkable as a specimen of Clarendon Press typography. It reproduces the contents of a Welsh manuscript of the 14th century, the types imitating or suggesting the abbreviations, the faint, retouched, or red letters, and the underlinings and interlineations of the manuscript. Yet the page is both clear and pleasing to the eye. The first 76 pp. are an *elucidarium*, or treatise upon the obscure points of theology. There is some connection between this Welsh text and an *elucidarium* in Latin (printed in the appendix), attributed by some to Lanfranc, by others to Anselm. But the Welsh can scarcely be a direct translation from the Latin. The rest of the volume consists of Welsh versions of well-known mediæval themes, such as the "Vision of Paul," the "Transitus Mariæ," the "Epistola Presbyteri Joannis," etc.

Part ix. of the "Anecdota" is more remarkable for the nature of its contents. It is the earliest known translation of the Old Testament into Basque. The translation is the work of a French-Basque Protestant clergyman, one Pierre D'Urte of St. Jean de Luz, about 1700. It comprises the whole of Genesis, and Exodus as far as xxii., 6. Internal evidence shows that it has been made neither from the Hebrew nor from the Vulgate, but from the Genevan (French) translation. The MS. is in the library of the Earl of Macclesfield, Shirburn Castle.

The distinguished German professor of political economy, Wilhelm Roscher, died June 4, 1894, in the seventy-seventh year of his age. He lived to complete the fifth and concluding

volume of his "System der Volkswirthschaft," the manuscript of which was found on his desk and has now been published by his son, Dr. Carl Roscher, under the special title, 'System der Armenpflege und Armenpolitik' (Stuttgart: Cotta). It is the substance of lectures delivered at the University of Leipzig since 1890, and begins with an interesting introductory chapter on the pathology of poverty, followed by a discussion of the therapeutics and prophylactics of poverty, or the means employed and found most effective for its cure and prevention, such as hospitals and asylums for poor children and adults, foundling-hospitals, savings-banks, pawn-shops, coöperative stores, life and accident insurances, and similar institutions for encouraging frugality and alleviating misfortune. There is also an admirable account of the character and treatment of the poor, not only in Germany, but also in England, France, America, and other countries, to which are added some excellent observations on the evil influence of the praise of poverty by the Catholic Church, an influence that extends even to Catholic political economists like Périn, who expatiates on "le bienfait de la pauvreté," and quotes with approval the injunction of St. Francis: "Be imitators of Christ in poverty; for our Lord was born poor, lived poor, taught poverty, and died in poverty." A section of the work is also devoted to trades-unions and to the uses and abuses of international associations for promoting the interests and protecting the rights of laborers. There is a good index.

Dr. F. Liebermann's paper on "The Text of Henry I.'s Coronation Charter," which was recently read before the Royal Historical Society, has been separately printed, and will also appear in the Transactions of the Society. Henry I.'s charter was called *Magna Carta* at the beginning of the thirteenth century, if not earlier, and it exerted considerable influence upon the constitutional struggle under King John. In the twelfth century there were more than thirty originals of the charter, one addressed to each county, but these have all been lost. Dr. Liebermann, with his usual ability and industry, attempts a critical reconstruction of the document on the basis of twenty-eight ancient texts.

To the fact of the compiler's being the father of children, "aged eight and nine," we owe the 'Index to *St. Nicholas*, vols. i.-xxi.,' which Mr. W. M. Griswold, Cambridge, Mass., has just added to his famous Q. P. series. Having bought the complete set of that periodical, he determined to make it available to his young people, and now he shares the key with the public at large. We doubt if the childish age was ever thus catered to before, or if any juvenile magazine was so honored.

'A Manual of Topographic Methods,' by Henry Gannett, chief topographer, constitutes Monograph XXII. of the United States Geological Survey. It is largely occupied with technical accounts of instruments, field methods, and tables for use in computations; but the fifth chapter is of more general interest, as it concerns the sketching of maps, and the necessity of understanding something of the forms that are to be sketched. The illustrations here are from actual topographic forms, as mapped by the Survey. In several matters Mr. Gannett's terminology, arrangement, and explanations are open to criticism. It is a misuse of a technical term to say that the Great Plains on the boundary of Colorado and Kansas, at an elevation of about 14,000 feet, are "near base-level." It is not well reasoned to instance the volcanic necks of New Mexico under forms produced by uplift. "Ridge" is an unhappy name for so slight an elevation as that of a flood-plain near its stream. These, however, are small affairs compared to the inculcation of the general principle that the topographer must be well trained in the meaning of topographic forms. It is to be hoped that our scientific schools will use Mr. Gannett's monograph as a guide to better instruction of their students. We regret to note that the important subject of Inspection is dismissed in nine lines.

The Geological Survey of Alabama, under the direction of Prof. E. A. Smith, has just issued a geological map of that State which must be regarded as an important addition to our scientific cartography. The base map, on a scale of about eight miles to an inch, is compiled from the records of the Land Office and Geological Surveys in Washington. Upon this, some thirty colors give an elaborate indication of the distribution of the geological formations. The State is thus easily seen to be divided into two chief areas. A large southwestern half, of coastal formations, dips gently southward and overlaps the descending extremity of the folded rocks of the Appalachians, which occupy the smaller northeastern half. In the latter, the topographical trend is distinctly northeast and southwest; in the former, it is about northwest and southeast; this contrast being the geographical product of a great geological unconformability between the two systems of rocks here included. A large sheet of text accompanies the map, giving a concise account of the several formations, their fossils, economic products, and soils, together with reference to the various survey reports in which they are described. We wish Prof. Smith might now direct attention to preparing, as only an experienced geologist can, a general geographical account of his State, in text, map, and pictures, which should serve as important an end in the secondary schools as his excellent geological map will serve in the universities.

Prof. M. W. Harrington, chief of the Weather Bureau, has lately issued an elaborate series of rainfall-charts of the United States in large folio form. Twelve charts give the precipitation for the months, four for the seasons, and one for the year. Then follow a number of smaller charts of snowfall, of monthly maxima and minima of rainfall, and so on. The text to accompany the charts is promised at an early date.

The late Robert Louis Stevenson's interest in Samoa, and the extraordinary influence which he exerted over the natives, are strikingly seen in one of the last incidents of his life. A few months ago some chiefs, grateful for kindness shown them by him during their imprisonment for rebellion, immediately on their release, instead of going home to their own places and families, came to him and offered to build a section of road for him as a free gift. With some reluctance, on account of their poverty and the need of their families, Mr. Stevenson consented for the sake of the good it would do to men to whom all manual labor was but recently a degradation. He explained these circumstances to some white guests who were assembled at the opening of the road, closing with these words: "It has been made for me by chiefs, some of them old, some sick, all newly delivered from a harassing confinement, and in spite of weather unusually hot and insalubrious. I have seen these chiefs labor valiantly with their own hands upon the work, and I have set up over it, now that it is finished, the name of 'The Road of Gratitude' (the road of loving hearts), and the names of those that built it." Then, turning to the chiefs, he pleaded with them to give up war and to defend their country by occupying and using it. "It is the man who makes roads, who plants food-trees, who gathers harvests, and is a profitable servant before the Lord, using and improving that great talent that has been given him in trust, that is the brave soldier; that is the true champion."

In our late notice of "Recent American Poetry" the name of the author of 'Madonna, and Other Poems' was misprinted "Merritt" for Harrison S. Morris. The error unfortunately was transferred to the index.

—A circular has been recently issued by Joseph Wright, M.A., Ph.D., Deputy Professor of Comparative Philology at Oxford, appealing for help in completing the materials for the proposed English Dialect Dictionary. The Dictionary will aim to include the complete vocabulary of all dialect words which are still in use or are known to have been in use at any time during the last 200 years. The Professor of Anglo-Saxon at Cambridge, the Rev. Walter Skeat, coöperates with Dr. Wright, and the English Dialect Society has for the last twenty years devoted its resources to the accumulation and printing of rare glossaries and unpublished collections of all kinds with a view to this comprehensive Dictionary of Dialects. Seventy volumes had been by the end of last year published by that society, and Dr. Wright has over a million slips, each dealing with one dialect word, containing the source with quotation, date, and county. A rough arrangement into alphabetical order has already been made, and those concerned—including not only Profs. Wright and Skeat, but many other specialists in England, Germany, and America—consider that it is urgently necessary to begin publication as soon as possible. Delay is dangerous, since every year makes accurate information harder to obtain. Pure dialect is rapidly disappearing, and it is therefore most important to begin publication this year if possible. Before this can be possible, however, further help in completing the material is required. Two hundred workers could in a very short time do all that is needed.

—In the collection of material two objects have to be kept in view: (1.) Every known dialect word (dialect being used in its widest sense for non-literary English) must be registered on a separate half-sheet of note-paper. This is necessary even though slang and vulgarisms may eventually be excluded from the Dictionary, and in spite of the existence of printed glossaries and word lists. (2.) A complete collection of illustrative quotations is indispensable, and correspondents are invited to send phrases actually heard from the mouths of the people. The pronunciation should be indicated. Books wholly or partially written in dialect should be carefully ransacked according to rules laid down by the editor. Finally, many novels, magazine articles, agricultural treatises, county histories, etc., contain dialect words which turn up even in newspapers and more unlikely quarters. Helpers are needed to keep a lookout for these and to make note of them with full reference to date, page, and column. *Notes and Queries* is being searched from the beginning. Readers should do nothing without first communicating with Prof. Wright, 6 Norham Road, Oxford.

—The Fifth Annual Report of the College Settlements Association announces an important step in its growth, viz., legal incorpora-

tion under the laws of Massachusetts, with a gift of $300 as "the beginning of a permanent fund." During the year ending September, 1894, the Woman's College of Baltimore (making the twelfth college) has been admitted to corporate membership, while thirteen colleges outside of the association, including the Universities of Oxford, Paris, and Leipzig, have supplied twenty-six collegiate subscribers. At the New York settlement a healthy sign of local growth is the appearance among the juvenile organizations of the Anti-Cigarette Club and the Clean City League. These college settlements—notably the Boston one—have naturally come into very direct and sympathetic contact with "organized labor." Although the representatives of the colleges are careful to state that their effort has been "to reconcile and not antagonize classes, and always . . . to bring into closer and better understanding the ranks of labor and capital," it is certain that when a settlement becomes the headquarters for local organized labor interests, and the centre for a sort of trades union propaganda, it at least risks being misunderstood by one of the two parties in interest. The extent of actual misunderstanding will be the measure of the college women's power of conciliation. To exercise this function effectively a settlement must select its friends and speakers from among prominent business men and employers of labor, as well as from among "prominent workingmen" and professional students; this has hardly yet been done by the enthusiastic and devoted residents of Denison House. Furthermore, if college settlements are to take any helpful hand in the solution of the labor question, they must introduce a more permanent tenure of office among their rank and file. The facts needed for such work are neither garnered nor grasped in a day, nor in six months, nor mainly by feminine intuition and logic. Subtracting from the fifty-five residents at the New York Settlement those who stayed less than a month, we have twenty-one; of this remainder, six were registered for one month, thirteen from two to ten months (average six), while but two were on duty one consecutive year. Of Philadelphia's thirteen residents during twelve months, two stayed one year, two over six months, nine between one and three months, an average of less than four months. At Denison House, Boston, in close affiliation with Wellesley College, among the eighteen residents, there was a similar spirit of flitting, the average residence being about four months.

—Teachers of Latin in our colleges ought to be grateful to Dr. H. W. Hayley of Harvard for having provided them with a singularly clear and useful 'Introduction to the Verse of Terence' (Boston: Ginn & Co.). In the compass of 25 pages the undergraduate can here find about all that he needs to know of the metrical construction of this poet—a subject which is always a stumbling-block to the beginner, and which is often avoided altogether by teachers—mainly, perhaps, because there has been no convenient manual in which their pupils (and themselves?) may find the needed information. This excuse no longer exists, for although the present little book is evidently the work of a finished scholar, yet its language is so simple and the principles are so plainly set forth that only the merest dullards can fail to comprehend. Dr. Hayley's modesty disclaims anything in the way of originality, but there are several places (notably his treatment of the fifth foot of the senarius) where he has discovered how to make clear, brief statements of facts in matters where there has hitherto been much darkening of counsel. The book is provided with references to larger works for more advanced students.

—The centennial of the Rutland (Vt.) *Herald* was celebrated on December 8, 1894, by the issue of a centennial number, one feature of which was a reproduction of the first number of the first volume, dated "Monday, December 8, 1794." Of the fifty newspapers in the United States a century ago, only five were published south of Pennsylvania, six in that State, ten in New York, eleven in Massachusetts; in Connecticut and New Hampshire five each. The Rutland *Herald* claims that only twelve papers—four of them in Massachusetts and three in New Jersey—have, like itself, reached the century mark. The memorial *Herald* is largely filled with accounts of the surroundings amid which it had birth and being. These details will no doubt form the basis of a better history of early Vermont than has ever been written. The latter end of the *Herald* has, however, forgotten much of its beginning. No complete file of its issues can be found at its office of publication or in Rutland. None is known to exist anywhere. Probably there was one in the newspaper collection which Henry Stevens, having spent twenty years in gathering, had brought to Montpelier and stored in the capitol—a building which was burned, with all the papers, in 1857. Vermont has since built a fireproof capitol, and treasures there whatever ancient papers are still to be obtained, but many links in the chains of issues are lacking. An instance has just come to the knowledge of the present writer. A Vermonter went to Montpelier in the course of researches which required him to examine *Spooner's Journal*, vol. xv., 1798. He sought that volume in vain throughout the State collection. Much to his surprise, it was shown him afterwards among the 8,000 bound volumes of newspapers in the rooms of the Wisconsin Historical Society.

—It can hardly be said that it was one of the greatest of Frenchmen, or of French writers, who passed away when Jean Macé died on December 13, but it was one of the most useful and helpful of men, and the author of a book which may fairly enough be called a classic. He was of modest origin, the son of a workingman, but he received a good education at the Collège Stanislas, and was for some time a professor there. Afterward he served for three years in the army; then was a private secretary; and later, in 1848, he became one of the editors of the *République*. The second of December filled him with such disgust that he left Paris and retired to a pensionnat at Bebelnheim. Here he had an opportunity to study thoroughly the minds and souls of children, their likings and dislikings, and what was easy and what hard for them. From these studies, much later, sprang his books. In 1861 he published his 'Histoire d'une bouchée de pain,' a book which is known the world over. It has appeared in innumerable editions in France, and still holds its own as a favorite gift-book and school prize-book. Other works in the same special *genre*, in which success is so hard to win, followed, and none were failures. In 1864, with M. Hetzel, he founded the popular *Magasin d'éducation et de récreation*. Somewhat later he devoted himself to the work of establishing communal libraries in the Haut-Rhin, and afterwards merged this work in that of his Ligue de l'Enseignement, which is very like the work done by the University Extension in England. It aims at furnishing, by means of free libraries and public lectures, mental and moral instruction and sustenance to apprentices and workingmen of all ages and of every trade. Since this epoch the history of the Ligue has been its founder's history. It has flourished in direct proportion as republicanism has flourished in France, and is now, the *Temps* says, one of the most valuable of the influences which make for righteousness and the much-needed purification of the Republic. On the 8th of December, 1883, Jean Macé was elected irremovable Senator in the place of the Comte de Lasteyrie. He died in his eightieth year.

—A curious type of character is illustrated by a biography which recently appeared in a Russian periodical. Prince V. V. Vyazemsky, who died near Moscow in 1892, had lived for thirty years in complete solitude. He was a very wealthy landholder, the owner of several thousand serfs. He freed his serfs in 1850, and set himself to acquire the knowledge which he regarded as indispensable for his peace of mind and equanimity of soul. He put in practice the theories of Count L. N. Tolstoi long before the latter began to advocate them, or, apparently, to hold them. Close acquaintance with the laboring classes, with their mental poverty and their entire lack of spiritual interests, prompted Prince Vyazemsky to mingle with the masses as a common laborer, in the hope that he might bring to bear, even on a single one of these masses, a moral and mental influence. His wife would not listen to his "ideas," or consent to modify the thoroughly worldly life which they were leading in Moscow. They had no children; each occupied a wing of the mansion. The Prince came to the conclusion that marriage does not result in personal happiness, while it does weaken a man's mind and spiritual energies. He provided handsomely for his wife, left home without a penny in his pocket, and hired himself to a bookbinder. A year later he settled on his estate, distributed all his land among his peasants, and for thirty-five years lived in a tiny hut in the forest, which he built with his own hands. He reduced his wants to a minimum, did everything for himself, and rarely visited Moscow. He was always glad to see people when they came to him. He was an accomplished entomologist and ornithologist, was possessed of a remarkable memory, knew the poetry of Pushkin and Lermontoff by heart, had read Shakspere through several times, and had a special love for Goethe's "Faust." He put in practice all the theories now known as "Tolstoyan," and it is probable that Count Tolstoi was influenced by him, as the two men lived only sixty miles apart, and the famous author could hardly have failed to hear about Prince Vyazemsky.

AN OXONIAN'S VIEW OF HARVARD.

Harvard College by an Oxonian. By George Birkbeck Hill. Macmillan. 1894.

In many ways this is a remarkable book. It displays an open mindedness rare in any foreigner, rarest of all in an Englishman criticising America or an American institution. It has humor. It is a marvel of minute research, as any one familiar with Dr. Birkbeck Hill's edition of Boswell knew it would be. But perhaps the most remarkable quality of all in the book is the sureness of its touch: Dr. Hill, as if by instinct, goes right to the characteristic traits of Harvard, and divines the attitude of

its professors and of the students as if he belonged interchangeably to either body. Thus to catch the atmosphere as well as the form and substance of Harvard College required special gifts, supplemented by much industry.

Not content with personal observation and questioning, Dr. Hill fitted himself by reading the various histories of Harvard, the President's Reports, and the more recent material in the *Harvard Graduates' Magazine;* and then he opened a quarry of information never hitherto properly worked—the biographies of eminent Harvard men. The historian of Harvard may deem it fortunate that so many of the Americans whose lives have been worth writing were either students or teachers at Cambridge. Dr. Hill has ransacked this material, from the Life of J. Q. Adams to the 'Letters' of Lowell and the 'Reminiscences' of A. P. Peabody, and from it all he has drawn the pith, with the result that his view of Harvard is both contemporaneous and historic, both academic and personal, and that he has made a book interesting not merely to Harvard graduates, but to whoever, on either side of the Atlantic, cares for a mellow description of university life.

But of course the first consideration is that this is the work of an Oxford scholar, a man trained among other traditions and by other standards, whether of social or of scholastic life—a critic, therefore, whose opinion should have the added value due to comparison. What, then, is the estimate which Dr. Hill, and Oxford through him, sets on Harvard? In almost all cases, the verdict is surprisingly favorable. In all that relates to university organization, we infer that Dr. Hill ranks Harvard above Oxford. He lets us see —what until recently Englishmen preferred to ignore themselves and to hide from strangers —the extent which favoritism plays in the appointment of teachers, the abnormal position of the holders of fellowships, the injustice wrought by sinecures, the hypocrisy which Church-of-Englandism breeds there and elsewhere in English society. In a land where outward conformity opened the door to rich prizes, a sceptic like Thirlwall might hold a bishopric, a pagan like Jowett might be master of Balliol, without creating any remark; for conscience and conformity rarely coincide. But what American has not been astonished, after intercourse with some English don that showed him an agnostic, to find that he had subscribed to the Thirty-nine Articles? The absence of this cant at Harvard particularly struck Dr. Hill; for Harvard, he knew, sprang from a theocratic community, and did not succeed in emancipating itself from the fetters of both Church and State until thirty years ago, and only nine years ago gave up compulsory worship.

It would be a mistake, however, to imagine that the manner of appointments at Harvard is always as smooth as Dr. Hill states. If any one believes that all the members of a department have merely to get together and decide on the name of a prospective colleague in order to secure his appointment, such a belief is not warranted. The present writer has heard the most eminent member of one of the chief departments say that his advice has never been asked on any appointment since he joined the department a good many years ago; and the same is probably true, with but few exceptions, throughout the college. The news that a man scarcely known to the college public has been called to fill a chair at Harvard has been repeated so often that nobody is now surprised at it. And although the overseers usually confirm the nominations submitted to them, it is inaccurate to say, as Dr. Hill says, that they always do so. Sufficient embarrassment has been caused by their holding over, or even rejecting, a nominee, to warn the Corporation that it cannot take their confirmation for granted.

We need not apologize for thus laying stress on what seems to be a consideration more personal than would naturally come within the province of a review like the present, for Harvard University to-day embodies a single personality to a degree equalled by very few institutions in the whole wide world. President Eliot has left his stamp everywhere: the various faculties, the Corporation, the overseers, have all helped to transform Harvard during the past twenty-five years, but to him rightly belongs the chief credit. He has made the University presidency not unlike the national presidency when Lincoln filled it—the seat of an autocrat, but of an autocrat wise and strong enough to exercise, by constitutional methods, the great authority due to the power of his personality and not merely to the prestige of his office. Dr. Hill, like Mr. Bryce, marvels at the importance of the American college president compared with the vice-chancellor of an English university. The latter has all the trappings of traditional dignity; he wears special, Britishly gorgeous garments, and is attended by beadles and others, in order that there may be no mistake that he is the Venerable One; and yet his power is slight when measured with that of the Harvard president, to whom the students—such is the unadmirable custom at Cambridge—do not bow in passing.

What we may call the magnification of the president's authority was not, as Dr. Hill remarks, contemplated in the early days, when Harvard presidents were knocked about by religious sectaries, or dismissed to die in poverty. Only a century and a quarter ago one of them was hooted out of office by the students; a little later, another was constantly quailing before the truculent John Hancock. We come down to Quincy before we reach a president at all corresponding to Mr. Eliot in the power to suffuse the institution with his personality. To such an extent did Quincy master details that his successor, Everett, could not long bear a strain which involved such drudgery as picking out wall-papers and carpets. One wonders whether Mr. Eliot's successor may not likewise be overwhelmed by the mass of petty duties which Mr. Eliot's great energy, executive capacity, and control of details have enabled him to discharge with apparent ease. A point worth noting, although we believe Dr. Hill has overlooked it, is that, while at Harvard the ratio between the number of teachers and the number of students has steadily increased, so that there is now one teacher to every nine students, instead of one to sixteen when President Eliot began his administration, the personnel of the administrative and executive departments has increased in no such proportion.

No one can approach even the outskirts of Harvard without hearing the hum of mighty workings. Work—we had almost said "hustle"—seems to be the motto of every one. The Corporation is so thoroughly a business body that it has not a member who may be said to be the especial representative of the humanities: indeed, of thirteen Fellows elected to the Corporation since 1868, but one, Francis Parkman, may be said to have stood primarily for learning. The machinery of the University has grown so large that the type of man whom the Corporation now choose to perpetuate their body is not a scholar, but either a successful financier who can aid them in their investments, or a successful jury-lawyer who can defend their interests in court. If we were told that the board of trustees of a law school had had but one lawyer, or that of a medical school had had but one physician, in a quarter of a century, we should suspect a paradox; and yet this is coming to be the prevailing condition not only at Harvard, but at the other American universities, where the rapid increase of wealth to be administered calls for business men rather than scholars.

Dr. Hill found that the scholarship of the best graduate students at Harvard is on a level with that of the high-honor men at Oxford—the Graduate School being, in the academic department, the real field of University teaching; but the average scholarship of the undergraduates falls short of the English standard. He shrewdly remarks that the great proportion of women teachers in the public schools may account for the imperfect preparation with which many youths go to college. He speaks strongly in favor of the scheme recently proposed at Harvard to separate students, according to their ability, into "classmen" and "passmen." The able student, he says, "must no longer be made to work on the same lines as the dunce and idler, merely doing well what they do ill." As a matter of fact, the able student usually chooses "hard" courses, whereas the dunce or idler chooses "soft" courses, or "snaps." Nevertheless, as Dr. Hill urges, a distinction should be made. "To attain the highest success the student has to reach the top in each one of the sixteen courses through which he has passed in his four years at college. Whether he has stood on the summit of sixteen mole-hills or sixteen mountains matters not a whit." On the other hand, we infer that Dr. Hill would not cite the experience of Oxford to support another recent proposition at Harvard—that scholarships be left open for all competitors, irrespective of their financial needs. One feels that the high-honor men in England work for money prizes more than for knowledge—as must be the case when a man by passing a successful examination wins what is practically a life annuity of £200 or £300. Of the system of examinations by which wranglers and first-class men are produced, Dr. Hill says:

> "It does to perfection that which it was meant to do. It fits men for the great world—for success at the bar and in public life. It turns out great lawyers and great statesmen. It keeps up a constant supply of leading-article writers—men who can rapidly make themselves masters of facts and as rapidly set them forth in a clear and able form. It confers dexterity and readiness. On the other hand, it breaks down a certain number—perhaps not many—by the excessive strain it puts upon them, and it unfits still more for the scholar's life. It is for success, not for knowledge, that the struggle has been, and it is success and not knowledge that too often is its great reward."

What Dr. Hill chiefly missed at Harvard was the intellectual sociability which is the delight of Oxford. "Each of the [Oxford] common-rooms," he says, "is a centre of kindly feeling and hospitality. Of these we have twenty, Harvard has not one. It will be easier for Oxford to take to herself all the good there is in the Harvard system than for Harvard to add to her vigorous and admirable organization all that charm and pleasantness of life which make an Oxford man's college scarcely less dear to him than Oxford herself." The line of contrast is well drawn, and yet we may ask how far the delightfulness of the English common rooms has depended on such

conditions as the conversion of professorships and fellowships into sinecures, and the fierce competition for money prizes, which are part of the mediæval system that the English universities are trying to get rid of. Moreover, more than a beginning in this direction has been made at Harvard in the formation of intellectual clubs, whose members meet their instructors freely, and in the seminaries, where the formal work of a department is carried forward voluntarily by the teachers and pupils.

And this brings us to say that Dr. Hill's remarks on the social life of the students are inevitably incomplete. He has, however, been guided by persons who were in the main trustworthy, although the senior who told him that Harvard students never carry canes and always refer to each other as "boys," instead of "men," was evidently setting a trap for the credulity of an amiable stranger. So, too, the average American will smile at the verdict of an Englishman who confesses that, having seen only the end of one baseball game, he thought baseball but a poor sport compared with cricket—"almost as much below cricket as skittles is below billiards." Dr. Hill criticises the present athletic mania, in which, according to him, American colleges have outstripped the English, although the latter may soon be expected to catch up. We are glad to record that the American practice of charging high prices for tickets to college games amazes a foreigner. "Charge nothing, and do not provide seats, and you will not be troubled by large crowds," is, in substance, Dr. Hill's remedy for the existing evils.

But we must forego taking up in detail many a topic which we had marked for discussion. We should give a wrong impression of Dr. Hill's book if we implied that it is formally argumentative. Far from it: Dr. Hill enlivens his pages with a multitude of amusing anecdotes, and he is remarkably fair and uninsular. The differences between the English and the Harvard systems are often to be inferred from his point of view quite as much as from his downright statements. The result, to Americans, is certainly gratifying, for it is shown that in plant and organism Harvard has nothing to learn from Oxford or Cambridge, and that, under the present régime at least, the spirit which animates the teachers and students at Harvard is a spirit of hard work such as is to be found only among a select minority at the English universities. We can say now with more assurance than could have been said even ten years ago, that Harvard seems to be succeeding in developing a type of university unlike either the English or the German, but better adapted than either to our American conditions, and capable of fostering the highest scholarship.

A SPANISH AMERICAN ANTHOLOGY.—I.

Antología de Poetas Hispano-Americanos. Publicada por la Real Academia Española. Tomo I., México y América Central; Tomo II., Cuba, Santo Domingo, Puerto Rico, Venezuela; Tomo III., Colombia, Ecuador, Perú, Bolivia. Madrid. 1893-'94.

THAT ingenious and delightful novelist and critic, D. Juan Valera, sometime Spanish minister to the United States, has remarked that, though the English-speaking portion of America has manifestly far outstripped the Spanish in material prosperity, the latter has more than held its own in letters. Few North Americans, we imagine, are competent to estimate the justice of this opinion; for few, very few, have the least knowledge of what has been done in literature in that great continent that occupies the southern half of our own hemisphere. It is not impossible to find among us scholars acquainted with the poetry of Persia and India, of China and Japan; but whither would one turn for an authority on the writers of Chile or Brazil? Our traders maintain fitful relations with these lands, our newspapers devote some meagre columns to their political affairs; but our critics have hitherto shown an almost complete indifference to the intellectual activities that obtain there. Even the Bureau of American Republics, we believe, did not venture into this field—a fact to be explained only on the ground that it was not supposable, according to our statesmen, that a North American could care anything about it.

Nevertheless, there is no country in South America that does not boast a somewhat extensive literature, nor any that has not produced men of letters whose work is of more than local interest and value. As long ago as 1863 the eminent German scholar Ferdinand Wolf, in his 'Histoire de la littérature brésilienne' (a far better treatise, by the way, than any as yet written about our own literature), revealed to European readers the existence of an astonishingly rich literary tradition among the Portuguese dwellers in the New World. From time to time, also, the attention of the curious may well have been attracted by the title of some one of the numerous anthologies of Spanish-American poetry—the 'América Poética' of Gutiérrez (Valparaiso, 1846), the 'Lira Americana' of R. Palma (Paris, 1865), the 'América Poética' of D. Cortés (Paris, 1875), the 'América Literaria' of Francisco Lagomaggiore (Buenos Aires, 1883), the 'Poesías de la América Meridional' of Anita J. de Wittstein (Leipzig, 1870), and others. The extreme rarity of these books, however, even in the great libraries of this country, would seem to indicate that few have been found among us to seek and read them. And now we have still another anthology offered us, of wider scope and greater authority than any of those just mentioned. Moved by the general interest of the Columbus centenary, the Spanish Academy at Madrid has undertaken the publication of a collection of poems that shall show the very best that Spanish-American writers have produced in verse. The task of editing and of preparing the necessary introductions has been intrusted to the brilliant professor and Academician, D. Marcelino Menéndez y Pelayo, whose anthology of Spanish lyric poets was noticed some months ago in these columns. Various Spanish-American literary bodies, moreover, have lent their aid, going so far in some cases as to compile for the editor's use manuscript anthologies of the poetry of their respective countries. Already three large volumes have appeared, covering all the Spanish-American countries, except Chile and Argentina; and as these last are for various reasons the least interesting of all from a literary point of view, it is not too early to give the reader some notion of what he will find in Señor Menéndez y Pelayo's pages.

It is hardly possible for a North American, especially in view of Señor Valera's dictum, to read these volumes without constant comparison of what our Southern neighbors have accomplished with that which we ourselves have done. It need hardly be said that such a reader will find himself frequently startled, now by trivial unexpectednesses, now by contrasts in the most essential things. What Bostonian, for example, can read without a shock that the question as to the true Athens of America lies between Carácas and Bogotá? What scholarly New Yorker but must pause to reflect when he discovers that, without his knowing anything about it, not a few of the best works of the best South American poets have first seen the light in New York? Again, how many of our university men realize that, long before Harvard was founded, before even the Massachusetts Bay Colony was established, the Spanish settlers had their universities and colleges fully under way? The University of Mexico opened its doors to students in June, 1553; and its chairs of jurisprudence, philosophy and physics, and humanities were filled by really eminent professors, of repute in Spain as well as in America. The University of San Marcos at Lima in Peru, the richest and most influential in South America proper, was established by royal charter of Charles V. in 1555, and offered instruction in philosophy, theology, medicine, and jurisprudence. In Ecuador, not to mention several colleges founded in the sixteenth century, the University of St. Gregory the Great, at Quito, was opened in 1620. New Granada (the modern Colombia) obtained its University of Santo Tomás at Bogotá in 1627. In Venezuela, the College of Santa Rosa at Carácas, founded in 1696, was in 1721 converted into a full-fledged university, with all the faculties. Chuquisaca, or Sucre, the present capital of Bolivia, long before the erection of the modern state, had a university which, during the eighteenth century, attained great eminence. Cuba has had its university at Havana since 1721; and Santo Domingo, in the days of its most desperate depression, before its cession to the French in 1795, still prided itself on its university, which, according to tradition, dated from the time of Charles V.

These are striking facts; but still more striking, perhaps, is the community of intellectual interests maintained down to the very war of Independence between the Spanish colonists and their native land. Here Spanish America had undoubtedly a great advantage over English America. No one can read the history of English colonization without being struck by the intellectual isolation into which the settlers came. They brought interests with them, to be sure—deep though narrow. But the great movement of the English spirit during the seventeenth and eighteenth centuries did not trouble itself with them; the great English writers rarely mention them, and, with the exception of Berkeley, show little concern for their experiment or their fate. Spain, on the contrary, was engaged in a very different way by the conquest and the colonization of America. For her these were national projects, not the poor last recourse of an oppressed party or sect. Accordingly, her ambition, her pride, and her imagination were all stirred; all classes in her society, high and low, rich and poor, soldier and scholar, alike shared in the desire to have a part, direct or indirect, in so glorious an undertaking. It was not a hardship, but an honor, to go to lands abounding in wealth, where fame and fortune could be won and salvation achieved by one and the same stroke. Even so, the North American reader cannot but be surprised at the number of Spanish writers and scholars who, during the sixteenth and seventeenth centuries, found their way to the colonies for longer or shorter sojourns, as well as at the interest taken in them and in the first native geniuses of New Spain by the best talents of the Peninsula.

We may pass by with a mere mention, as

leading to no practical results, that most interesting document, Cervantes' application for a post in the *Indias*—either, as he says, the auditorship of New Granada, or the governorship of the province of Soconusco in Guatemala, or the auditorship of the galleys at Cartagena, or the mayoralty of the city of La Paz. Of greater consequence was the early presence in nearly every one of the colonies of one or more men who, if not belonging to the first rank of Spanish writers, still had breathed the literary atmosphere of the "Siglo de Oro," and by their work won the approbation of the great masters. Thus we find in Mexico during the sixteenth century Bernardo de Valbuena, Juan de la Cueva, Francisco de Salazar, Eugenio Salazar de Alarcón, Mateo Alemán, and Diego Mexía. The very conqueror of New Granada and the founder of Santa Fé de Bogotá, Gonzalo Jiménez de Quesada, a quondam Cordovese lawyer, was a writer of no mean powers. In the same province lived also the famous Juan de Castellanos, prolix beyond endurance, but still an *écrivain de race*. We find Peru visited in the sixteenth century by the same Diego Mexía, who was for a while in Mexico, as Menéndez y Pelayo says, "the most felicitous translator of the *Heroides* of Ovid that up to the present time our tongue has had." In Peru also, and for a longer time, lived Fr. Diego de Ojeda, author of the 'Cristiada,' far the best of all the Spanish sacred epics and not always below the level of the 'Paradise Regained.' Even Puerto Rico and Santo Domingo were not without their touch of literary influence—the former in the person of Valbuena, bishop there in his old age (1620–25); the latter in the adventurous captain Gonzalo Fernández de Oviedo y Valdés, as remarkable for the twenty-odd folio volumes he wrote as for his extraordinary activity and experiences.

These celebrities, however, were far from constituting the whole body of intermediaries who carried the best of Spanish culture to the New World. With them went many of less name, but perhaps not less influence. Among these were teachers of the humanities in great numbers, who speedily diffused the study of the classics throughout the colonies, not only in the capitals, but also in the smaller places. This is illustrated by the statement of the poet Mexía that, having undertaken the voyage from Peru to Mexico in 1596, he was driven by stress of weather into the harbor of the little San Salvadorian town of Sonsonate, where he bought from a student the copy of Ovid that served him for his translation of the 'Heroides.' A further illustration is the well-known richness of the old book-shops of Mexico and Lima in fine old editions of the classics. As a consequence, the tradition of humanism speedily established itself, and love and admiration for the Latin classics became a permanent element in South American culture. Even the refinements of classical study, such as the composition of Latin verses, were not neglected; and we have a long line of poets in this genre, culminating in the last century in the Jesuit of Guatemala, P. Landivar, whom Menéndez y Pelayo does not hesitate to compare with Politian, Fracastorius, and Pontanus, as "one of the most excellent poets to be found in modern Latinity." And, indeed, his 'Rusticatio Mexicana' is one of the most interesting works written on American soil.

The fact that Landivar was a Jesuit, as well as the subject of his poem, suggests still another powerful influence upon South American letters. Hardly had the Society of Jesus become thoroughly established when it began to send its members across the ocean, both as missionaries to the conquered Indians and as teachers of the conquering Spaniards. Many of these men were persons of fine cultivation; and, what is more important for our present purpose, they had their share in the development of that poetic tradition which may fairly be called "Jesuitic"—a tradition as yet little studied, and too often alluded to with scorn, but none the less deserving of attention. Primarily descriptive in its character, and based upon the Georgics of Virgil, this Jesuitic poetry has undoubtedly produced many monuments of portentous dulness. Even its best-known representative, the Abbé Delille, despite his extraordinary popularity at the end of the last century, now finds more to rail at than to read him. None the less, however, the poetry of description owes more to him and to his fellow-poets than is generally admitted; and certain it is that the persistence of the tradition in South America has given rise to works that far surpass in power and beauty anything in their kind we Americans of the North can boast of. The quaintly named 'Memoria sobre el cultivo del maiz en Antioquía' of the Colombian Gutiérrez González, and the 'Agricultura en la zona tórrida' of the Chilean Andrés Bello, give us the landscape, the natural life, the human occupations of the South American community with a tender respect such as among us Whittier alone has shown, and with a force and beauty of poetic expression such as Whittier never attains.

Walton, and Some Earlier Writers on Fish and Fishing. By R. B. Marston, Editor of the *Fishing Gazette*. London: Elliot Stock. 1894.

ANGLING literature, especially the early part of it, offers many pleasures to the lover of the quaint and curious, as well as to those who enjoy the beautiful descriptions of natural objects with which some of these works abound. Mr. Marston is thoroughly competent to set forth in an attractive way the choice portions of the various writers from whom he quotes, and, being an angler as well as a literary man, he tells many things of interest to those who care more for catching fish than for the ethical part of his volume.

Walton, of course, is Mr. Marston's chief figure, and he has succeeded in producing something new on this well-worked subject, at which almost every angling writer of this century has had a try, and generally an unsuccessful one. The discovery where the excellent pictures of fish in the early Waltons were obtained is given on page 141. Doubtless Mr. Marston is correct in stating that they were copied from the works of Gessner, the great German naturalist, to whom Walton frequently refers. The prices at which first Waltons have sold are very interesting. Mr. Marston quotes the value in 1816 at £4 4, but in a copy of the first formerly owned by William Crawhall is a list, in Mr. Crawhall's writing, of the prices at which this copy had been sold at auction. They are probably chronologically arranged, though no dates are given, and there are ten quotations, beginning with the Haworth sale, at which the volume sold for £10 15, and ending at the Gardner sale, where it fetched £10 17 6. At the Nassau sale the price was £3 10, which is below the £4 4 quoted as the 1816 price by Mr. Marston. At the Beckford sale in 1883 a copy brought £87. Three or four have since been sold at auction, the last perfect one fetching £310, though we believe there was some special association of former ownership in this which increased its value, as one has since been sold for £235 by Pickering & Chatto.

Chapter x., on "The Compleat Angler from an Angler's Point of View," is charming from the sentimental as well as from the practical side, and is perhaps the best in a book where all are excellent. Mr. Marston has of course quoted largely from Walton, and made no mistakes in selecting these passages most worthy of repeating. The first of the verses of "Holy Mr. Herbert," themselves quoted by Walton, and beginning:

> "Sweet day, so cool, so calm, so bright,
> The bridal of the earth and skie,
> Sweet dews shall weep thy fall to-night,
> For thou must die,"

is given before this apostrophe to angling: "No life, my honest Scholar, no life so happy and so pleasant as the life of a well-governed Angler; for when the Lawyer is swallowed up with business, and the Statesman is preventing or contriving plots, then we sit on Cowslip-banks, hear the birds sing, and possess ourselves in as much quietness as these silent silver streams, which we now see glide so quietly by us," etc.

Dame Juliana Berners or, more properly, "Julyans Barnes," to whom is attributed the 'Treatyse of Fysshynge with an Angle,' 1496, a republication of the 'Book of St. Albans,' printed ten years previously, is discussed and her merits set forth in chapter ii. Mr. Marston makes no reference to a publication of Mr. Satchell's, in 1883, of an older form of 'Treatyse of Fysshynge with an Angle,' from a MS. in the Denison collection, to which Prof. Skeat assigns an earlier date than 1450, and Mr. Satchell thinks that this was compiled from some earlier original. However, Dame Julyans first gave it to the public, and to her should go the credit for the sound morality and sportsmanlike advice found therein.

In 1613 was published 'The Secrets of Angling,' by J. D., which Mr. Marston calls "the most charming poem in all our English angling literature." If not quite the truth, this commendation is pretty near it, and the admirable reprint, with an excellent introduction by Thomas Westwood (London, 1883), is a book that should be in every gentlemen's library. There are certainly few more beautiful verses in praise of Summer and her natural beauties than these by J. D.:

> "I count it better pleasure to behold
> The goodly compasse of the loftie Skye,
> And in the midst thereof, like burning gold,
> The flaming Chariot of the world's great eye,
> The watry cloudes that in the ayre vprold
> With sundry kindes of painted collours flie:
> And fayre Aurora lifting up her head,
> And blushing rise from old Tithonus' bed.
> . . . . . .
> The lofty woods, the forrests wide and long,
> Adorned with leaues and branches fresh and greene,
> In whose coole bowr's the birds with chaunting song
> Do welcome with their quire the Summers queene,
> The meadows faire where Flora's guifts among
> Are intermixt the uerdant grasse betweene,
> The siluer skaled fish that softlie swimme
> Within the brookes & Cristall watry brimme."

Thomas Barker, who is accused of having been a cook, published in 1651 'The Arte of Angling,' a second edition of which he called 'Barker's Delight.' In this short work is first mentioned the use of the winch or reel. Walton quotes from Barker, who, he says, is "a gentleman who has spent much time and money in angling." Gervase Markham wrote numerous works on angling and other rural amusements and avocations, of which the titles even are interesting: 'The English Husbandman drawne into two bookes' (1613); 'The Pleasvres of Princes, Good Mens Recreations, containing a discourse

of the generall art of fishing with the angle or otherwise, and of all the hidden secrets belonging thereunto; together with the choyce of the fighting cocke' (1614); 'Cheape & Goode Husbandry for the well ordering of all beasts & fowles & for the general cure of their diseases' (1616); 'The Young Sportsman's Instructor in angling, hawking, hunting, ordering singing-birds, poultry, coneys, hares, & dogs, & how to cure them.' This last is a very diminutive volume, about two inches square and very scarce. There was printed (*circa* 1712) another edition with a second title, which is one of the rarest of angling books. Mr. Marston thinks that Markham may have been assisted in the compilation of his book of 1614 by one William Lawson. It is evident from their great differences in style and composition that he must have had help in some of his numerous books.

Although Mr. Marston has made a most interesting book, it is to be regretted by every lover of angling literature that he has passed by so much valuable material. Du Bartas alone could furnish a chapter. The establishment of the identity of Stephanus, whose wonderful recipes are quoted by Mascall, the only known reference to him, would be a task well worthy of Mr. Marston's powers. 'A Family Jewel, or the Woman's Counsellor' (1704), 'The Accomplish'd Ladies Delight in preserving, physich. beautifying, & cookery . . . also some new & excellent secrets & experiments in the art of angling' (1683), and other works of this period, are well worthy of notice.

The great interest, however, centres in Walton himself, and this is fully recognized by Mr. Marston. These lines from the beautiful verses of Mr. Westwood, to whom and his associate, Mr. Satchell, is due the gratitude of every lover of angling literature, though not quoted in the volume under notice, seem especially applicable to its chief subject:

> "So Fine-ear, bending, Izaak, o'er thy tomb,
> Through chink and crevice of the mouldering stone
> Hears, as it were, a riople and a rhyme—
> Hear quaint discourse—Piscator's homily,
> Venator's staid response, and, after pause,
> The piping minor of the Milkmaid's song.
> With cadence of the nightingale and thrush,
> Or distant-sounding bay of otter hounds:
> Old life, old sport of Lea-side and of Dove—
> The life we cherish, and the sport we love."

Theatricals. By Henry James. Harpers. 1894.

"The Album" and "The Reprobate" are the names of two new, or, at all events, unacted, comedies which constitute the second volume of Mr. Henry James's 'Theatricals,' and, like their predecessors, "Tenants" and "Disengaged," they are introduced to the public by their author with an explanatory and apologetic preface, which again sets forth, with an assumption of good humor and resignation that does not quite conceal the workings of a rebellious spirit, the infinite difficulties, restrictions, and intellectual humiliations besetting the man of letters who tries to write a play to order, with the view of "fitting" a particular player or a particular company. It must be admitted, after reading his account of them, that the conditions imposed upon him were not to be fulfilled easily. His subjects were to be chosen "from the uttermost regions of dramatic amiability," to be surrounded with "the bland air of the little domestic fairy tale," to be comprised within the strictest definition of comedy (not in itself, perhaps, a very tremendous limitation), to be sentimental and gay, abounding in coincidence, and served up in a whirl of perpetual motion. Nor was this all. He soon found, by bitter experience, that artistic, literary, and truly dramatic considerations, such trivial matters as probability, proportion, consistency, and intelligibility, were held to be of small account, as compared with such theatrical necessities as startling incidents and situations, incessant bustle, opportunities of personal display, remorseless compression, and a happy ending for everybody and everything. Finally, doubtless there was the mortification (although Mr. James touches but lightly on this point) of being obliged to submit, in all questions of expediency, propriety, reasonability, or taste, to the managerial judgment—a tribunal generally beyond all powers of argument or appeal.

A play compounded according to managerial prescription may succeed so far as mere money-making is concerned, but it rarely happens that one of them is worth printing afterwards, and this is a truth of which Mr. James shows himself conscious. Not that there is not enough literary merit in "The Album" and "The Reprobate" to justify their publication. On the contrary, there is in their polished and witty dialogue much to please the intelligent reader; nevertheless, their inherent feebleness as plays, in both conception and construction, is revealed very clearly when left to the interpretation of type only. Both in plot and in their characters they are curiously artificial, unlifelike, and extravagant for the inventions of a student of modern society.

"The Album" is founded upon the story of a miserly and unscrupulous baronet, who secures a fortune for himself by wilfully concealing the fact of the existence of another heir, his own first cousin. Having inherited the money, he is pursued at home and abroad by two women, each of whom is determined to marry him, and one of whom almost captures him. Partly to get rid of her, and partly because he fears that his treachery to his cousin will be exposed by the heroine, he surrenders his ill-gotten gains and so escapes disgrace and matrimony. Something, perhaps, might be made out of this scheme by adroit treatment, but Mr. James's management of the whole testamentary business is unconvincing, while the baronet and his feminine persecutors have scarcely a touch of actuality in them. The hero and heroine are more human, but their troubles fail to excite sympathy, because they arise mainly from that unnatural suppression of fact which is one of the oldest devices for maintaining stage complications.

"The Reprobate" depends upon a yet slighter foundation. The hero is a young man thirty years old, who, having been guilty of a youthful escapade, has been convinced by his stepmother and another guardian that nothing but the extremest mental and physical asceticism can save him from ruin. He allows himself, therefore, to be treated like a baby until the heroine inspires him to play truant for a day or two in London, whence he returns transformed into a dashing young lover, to marry the heroine and assume the direction of everything and everybody. There are some neatly executed character sketches in this piece—the bumptious and ignorant young member of Parliament, for instance—but the Reprobate himself, the central figure, is too fantastic even for amusement, unless, indeed, he should be played in the broadest and frankest spirit of burlesque, which would ruin every other character. Making every allowance for the good quality of much of the dialogue, and the possible comicality of some of the situations, it is difficult to believe that a play of so little plausibility could have any chance of successful representation. Certainly it is unworthy of Mr. James's reputation and undisputed abilities. Fitting plays to companies is mere tailor-work, a shocking waste of real talent and a terrible encouragement to bad acting.

The Borderland of Czar and Kaiser. By Poultney Bigelow. Harper & Brothers.

This collection, in book form, of Mr. Bigelow's articles from *Harper's Monthly*, with some added matter, forms a pleasant, pretty little volume. Naturally, the two chapters on German soil, "Side Lights on the German Soldier," and "Emperor William's Stud-Farm and Hunting-Forest," are of more value than the six chapters on Russia, as Mr. Bigelow was not in Russia long enough to make many personal observations or to make inquiries about the statements of his informants. "In the Barracks of the Czar" is interesting, because it does present, chiefly, personal observations, though the author's Polish military friend is stationed in Poland (between St. Petersburg and Kovno), where the officer asserts that no Poles are assigned to duty. "The Russian and his Jew" is distinctly good, fair, and well stated. The last two chapters read like a summary of sessions of the Senate Investigating Committee, in their list of briberies and various sorts of corruption. Many of the statements as to agricultural conditions in "On a Russian Farm" are correct, but require further explanation to set them in their true light. The root of the whole difficulty is, without a doubt, the system of holding land in common, and being assessed in common for the taxes, with the inevitable results, from which those who advocate communistic principles might draw a valuable lesson.

If we may judge from his dedication, Mr. Bigelow regards his explanation of "Why we left Russia" as the most important part of his book. But, from his own account, the Russian Government had nothing to do with it. On June 1 he and Mr. Frederick Remington (whose delightful pictures furnish at least half its value to the book) sent a letter, presumably from Berlin, to the American Chargé d'Affaires at St. Petersburg, stating that they were on a "mission" to inspect the tree- and grass-planting along the sandy seashore of the Baltic. They wished to make notes and sketches as they sailed along the coast in their canoes. The letter probably reached Petersburg on June 3 or 4; they called on the American diplomat on June 6; sent their boats back to Germany on the 8th, without waiting to see whether permission would be granted or not; and were in Kovno, well on their way back to Germany, on June 10. In the meantime, Mr. Bigelow had made a trip to a "Russian Farm," and both travellers had stopped on their way to Kovno to visit "the Czar's Barracks." Evidently, they left Russia because they were impatient, and because they preferred to appear as "a mission" rather than as private citizens. As it was, they could probably have taken their trip and made, without permission, their notes and sketches, as other travellers have done before them, had they wished. The incident with the passports was in reality not alarming. If there had been anything wrong, they would have been summoned to the police office or interviewed by the police. The landlord of their hotel was trying to detain them for his own profit, by keeping the documents beyond the legal time-limit. It is also very puzzling to be told that they did not receive their canoes in Stettin until July 2, after having last seen them on June 8 in St. Petersburg,

and then to learn (p. 307) that Mr. Bigelow lifted from his shoulder the sails and masts of his canoe, and tossed the clumsy load on what he took to be a pile of corn-sacks covered with tarpaulin—which turned out to be a woman—in Kovno, on June 10. A little longer acquaintance with the country might have led Mr. Bigelow to different and wiser conclusions on many points.

The Outlines of Quaternions. By Lieut.-Col. H. W. L. Hime. Longmans. 1894.

It is our duty to say that the value of this book is less than nothing. True, it is free from the inconvenience of being too difficult which attaches to several treatises on the subject. It has the opposite fault of not carrying the student far enough to make him realize the full power of the method. The elementary parts are often awkward, and do not seem to be fully in the spirit of quaternions. In some places we find monstrous heresies. Thus, it is stated that all equiangular versors are equal! Such a remark is not elucidating the calculus of quaternions, but muddling it. The mathematical reader will hardly believe it possible, but it is true that the author deliberately writes

$$i=j=k,$$

and says this is true of these letters considered as quadrantal versors, though not as vectors.

After treating of every kind of quaternion, and particularly scalars and vectors in different planes, for 48 pages, on page 49 we find the objection that heterogeneous quantities cannot be added, treated seriously—a doubt which ought not to have been ignored so long. "It may be objected," says the author, "that a number and a line . . . can no more be added together than a pint and a mile." Instead of giving any clear reply, to the effect that a pint and a mile can be added, though not reduced to one term, he tries to excuse the idea of multiple algebra, and only to excuse it, by saying it is like the functional expression $(1+\Delta)$. The analogy is superficial, because the 1 and Δ are not really but only seemingly heterogeneous. In short, the author has no firm grasp of the fundamental conceptions of his subject, and his book is fit to be put into the hands of students who have such grasp only as an exercise in refutation.

BOOKS OF THE WEEK.

Arnold, Miss Sarah L. Waymarks for Teachers. Silver, Burdett & Co. $1.25.
Bierbrower, Austin. From Monkey to Man; or, Society in the Tertiary Age. Chicago: Dibble Publishing Co.
Bricqueville, Eugène de. Les Anciens Instruments de Musique. Paris: *L'Art.*
Browning, Mrs. E. B. Sonnets from the Portuguese. London: Dent; New York: Scribners. $4.50.
Brugmann, Prof. Karl. A Comparative Grammar of the Indo-Germanic Language. Vol. IV. Westermann.
Budde, Prof. K. The Books of Samuel in Hebrew. Leipzig: J. C. Hinrichs; Baltimore: Johns Hopkins Press.
Bunner, H. C. More "Short Sixes." Illustrated. Keppler & Schwarzmann.
Burdette, R. J. The Modern Temple and Templars: A Sketch of the Life and Work of Russell H. Conwell. Silver, Burdett & Co. $1.25.
Call, Annie P. As a Matter of Course. Boston: Roberts Bros. $1.
Carpenter, Mary T. In Cairo and Jerusalem: An Eastern Note-Book. Randolph. $1.50.
Calverley, C. S. Verses and Fly-Leaves. Putnams. $1.50.
Chambers's Concise Gazetteer of the World. London: W. & R. Chambers; Philadelphia: J. B. Lippincott Co. $2.50.
Clegg, James. The International Directory of second-hand Booksellers and Bibliophile's Manual. Rochdale, Eng.: James Clegg; New York: John Anderson, Jr.
Dennis, J. T. On the Shores of an Inland Sea. Philadelphia: J. B. Lippincott Co.
Dixon, Prof. A. C. The Elementary Properties of the Elliptic Functions. Macmillan. $1.25.
Driver, Prof. S. R., and White, Rev. H. A. The Book of Leviticus in Hebrew. Leipzig: J. C. Hinrichs; Baltimore: Johns Hopkins Press.
Eaton, Seymour. Business Forms, Customs, and Accounts. American Book Co. 50 cents.
Encyclopædic Dictionary. Vol. IV. Rhe—Z. Philadelphia: Syndicate Publishing Co.
Furman, A. A. Philip of Pokanoket: An Indian Drama. Stettiner, Lambert & Co. $1.50.
Futterer, Karl. Afrika in seiner Bedeutung für die Goldproduktion in Vergangenheit, Gegenwart und Zukunft. Berlin: Dietrich Reimer.
Gilbert, W. S. Original Plays. Third Series. London: Chatto & Windus; New York: Scribners. $1.
Giles, F. S. Shadows Before; or, A Century Onward. Humboldt Publishing Co. 50 cents.
Godwin, Parke. Commemorative Addresses. Harpers. $1.75.
Gomme, Alice B. Children's Singing Games. Second Series. London: David Nutt; New York: Macmillan. $1.50.
Haeckel, Prof. Ernst. Monism as connecting Religion and Science. London: A. & C. Black; New York: Macmillan. 80 cents.
Hadow, W. H. Studies in Modern Music. Second Series. Macmillan. $2.25.
Harte, W. B. Meditations in Motley. Boston: *Arena* Publishing Co. $1.25.
Hayley, H. W. An Introduction to the Verse of Terence. Boston: Ginn & Co. 35 cents.
Henderson, W. J. Sea Yarns for Boys. Harpers. $1.25.
Hewitt, Grally. Knights of Cockayne. London: Osgood, McIlvaine & Co.
Hinckley, F. A. The Deeper Meanings. Boston: G. H. Ellis. 50 cents.
Hoffman, Otto. Episodes from Andreas Hofer. Maynard, Merrill & Co. 25 cents.
Holden, Warren. Many Moods. Philadelphia: J. B. Lippincott Co. 75 cents.
Hopkins, E. P. Problems and Quiz on the Law of Contracts. St. Paul: West Publishing Co.
Hopper, Nora. Ballads in Prose. Boston: Roberts Bros. $1.50
Hunt, Matthew. The King's Daughter, and Other Poems. London: Elliot Stock.
Huntington, Margaret W. Told in a Hammock. Illustrated. Marcus Ward & Co. $1.
Hurll, Estelle M. Child-Life in Art. Illustrated. Boston: Joseph Knight Co. $2.
Hyde, J. W. The Post in Grant and Farm. London: A. & C. Black; New York: Macmillan. $1.75.
King, Bolton. Essays by Joseph Mazzini newly done into English. London: Dent; New York: Macmillan. $1.
Lethaby, W. R., and Swainson, H. The Church of Sancta Sophia, Constantinople: A Study of Byzantine Building. Macmillan. $6.50.
Lewis, L. R. The National School Library of Song. No. 1. Boston: Ginn & Co. 60 cents.
Lorimer, Rev. G. C. The Argument for Christianity. Philadelphia: Baptist Publication Society. $2.
Lowell, Percival. Occult Japan: or, The Way of the Gods. Boston: Houghton, Mifflin & Co. $1.75.
Macaulay's Essay on Milton. American Book Co. 20 cents.
Magnus, Lady. Boys of the Bible. Illustrated. Raphael Tuck & Sons.
Machen, Arthur. The Great God Pan, and the Inmost Light. London: John Lane: Boston; Roberts Bros. $1.
McClelland, M. G. St. John's Wooing. Harpers. $1.
McClung, D. W. Money Talks: Some of the Things It Says. Cincinnati: Robert Clarke Co.
Ostrander, S. M. A History of the City of Brooklyn and Kings County. 2 vols. Brooklyn: Mrs. W. M. Ostrander, 95 Madison St. $10.
Scribner's Magazine. 1894. 2 vols. Charles Scribner's Sons.
Strettell, Alma. Lullabies of Many Lands, Collected and rendered into English Verse. London: George Allen; New York: Macmillan. $4.
Thomas, Cyrus. Report on the Mound Explorations of the Bureau of Ethnology: Washington: Government Printing Office.
Ward, C. O. The Equilibration of Human Aptitudes and Powers of Adaptation. Washington: *National Watchman* Co. $1.25.

JANUARY

EDUCATIONAL REVIEW.

Articles.—Prof. S. S Laurie (with Portrait), Foster Watson; Necessary Reforms in the Colleges, Charles C. Ramsay; Concentration, Frank M. McMurry; Powers and Duties of School Superintendents, William A. Mowry; One Year with a Little Girl, Oscar Chrisman; Botany at the German Universities, George J. Peirce.
Discussions.—Colonel Parker's Review of Frye's "Primary Geography," William M. Davis; Some Interesting Statistics, Thomas B. Bronson.
Reviews. Editorials.

$3.00 a year (monthly excepting July and August): 35 cents a number.

HENRY HOLT & CO., N. Y.

Yale Mixture.

A GENTLEMAN'S SMOKE.

You won't know the luxury of Pipe-Smoking until you use Yale Mixture.

A two-oz. trial package, postpaid, for 25 cents.

MARBURG BROS.,
The American Tobacco Co., Successor,
Baltimore, Md.

Copeland and Day.

POEMS by JOHN B. TABB. Five hundred copies, small square octavo, green cloth and gold, $1.00; fifty copies on hand-made paper, $3.00.

The first edition of Father Tabb's *Poems* was entirely exhausted within twenty-four hours from the time of publication. A second edition is in rapid preparation, and will be issued on Saturday, January 5th.

"The poems are marked by purity, delicacy, grace, and spiritual refinement: poetry as true as it is unpretentious. The publication in beautiful yet simple form makes a true addition to American literature."—*Boston Transcript.*

"Father Tabb's verse has much of the true lyrical quality; it sings and moves. Moreover there is in it the spiritual atmosphere. . . . In this day when moral earnestness is so lacking in poetry, it is pleasant and a sign of better things to find a poet inspired by these themes, especially when he has art to back him, which Father Tabb certainly has."—*Hartford Courant.*

Copeland and Day, Boston.

SCIENCE.

A Weekly Journal Devoted to the Advancement of Science.

EDITORIAL COMMITTEE—S. Newcomb, Mathematics; R. S. Woodward, Mechanics; E. C. Pickering, Astronomy; T. C. Mendenhall, Physics; R. H. Thurston, Engineering; Ira Remsen, Chemistry; Joseph Le Conte, Geology; W. M. Davis, Physiography; O. C. Marsh, Paleontology; W. K. Brooks, Invertebrate Zoölogy; C. Hart Merriam, Vertebrate Zoölogy; N. L. Britton, Botany; Henry F. Osborn, General Biology; H. P. Bowditch, Physiology; J. S. Billings, Hygiene; J. McKeen Cattell, Psychology; Daniel G. Brinton, J. W. Powell, Anthropology.

Now Ready, New Series, Vol. I, No. 1.

CONTENTS.

To Our Readers.....S. Newcomb
Scriptoribus et Lectoribus, Salutem.....D. C. Gilman
The Character and Aims of Scientific Investigation.

Crowell's Library
OF
Economics and Politics.

American Charities.

A study in philanthropy and economics, by AMOS G. WARNER, Ph.D., Professor of Economics and Social Science in the Leland Stanford, Jr., University. (Vol. IV. in Crowell's Library of Economics and Politics.) 12mo, cloth, $1.75.

This work will be the first exhaustive treatment of the subject. It is a careful presentation of theory and of practical experience, making it an indispensable handbook for all those who are theoretically and practically interested in charities.

Volumes previously issued in this series:

Vol. I. The Independent Treasury System of the United States, $1.50

By DAVID KINLEY, Ph.D., of the University of Illinois.

Vol. II. Repudiation of State Debts in the United States . . $1.50

By WILLIAM A. SCOTT, Assistant Professor of Political Economy in the University of Wisconsin.

Vol. III. Socialism and Social Reform. $1.50.

By RICHARD T. ELY, Ph.D., LL D., Professor of Political Economy, and Director of the School of Economics, Political Science and History in the University of Wisconsin.

For sale by all booksellers, or sent postpaid on receipt of price.

Brown Brothers & Co., Bankers,

NO. 59 WALL STREET, NEW YORK.

A DESCRIPTIVE CATALOGUE, giving Contents and Critical Opinions of the 528 books from HOUGHTON, MIFFLIN & CO.'s List included in the Model ("A. L. A.") Library exhibited at Chicago, will be sent to any address. 4 Park St., Boston.

Third Large Edition Just Issued.

The Century Cyclopedia of Names.

The reference-book par excellence.

Not only the very latest, but the most wonderful single-volume reference-book ever made. It is just what every one wants. Here, in one alphabetical order, fully defined, are:

Names of Persons:
Authors, Artists, Statesmen, Divinities, Characters in Fiction, etc.

Names of Places:
Modern and Ancient Geographical Names, Imaginary Places, etc.

Popular Names and Epithets.

Names of Notable Streets, Parks, Animals, Ships, Buildings, Institutions, Parties, Clubs, Works of Art, Stars, Constellations, etc.

Names of Books, Operas, Plays and Important Characters therein.

Historical Events:
Wars, Battles, Plots, Congresses, Riots, Crusades, Alliances, etc.

A book to which one may turn when in doubt as to *any name met with in one's reading.*

Price, from $10 to $15, according to binding. Sold only by subscription—not in the bookstores. For particulars address the publishers:

The Nation.

NEW YORK, THURSDAY, JANUARY 10, 1895.

The Week.

THE Democratic caucus of the House of Representatives has voted by 81 to 59 in favor of the bill known as the Springer substitute for the Carlisle currency bill. The caucus refused, in the most decisive manner, to make this action binding on individual members. The 81 affirmative votes are not sufficient to pass the bill, as against the Republican votes in the House, nearly all of which will be cast against the measure on account of the State-bank feature, if for no other reason. Therefore there is little likelihood of the bill reaching the Senate. It is, nevertheless, a great step forward when the Democratic party votes that something ought to be done looking to the substitution of banknotes for greenbacks. The party has actually voted to "take the Government out of the banking business."

The chief merit of the bill under consideration is in section 9, which provides that the secretary of the treasury may, in his discretion, use the surplus revenue of the Government in the redemption and retirement of the legal-tender notes to an amount not exceeding 70 per cent. of the new bank circulation taken out. This clause ought to be made rather more imperative and definite. It ought to provide that the legal-tender notes be cancelled, destroyed, and not reissued. But as it stands, it is a sign of returning sanity in the Democrats, and we venture to say that it will not be lost upon the Republican party. The latter has made itself in some sense a defender of the greenback as a symbol of loyalty, "battle-scarred and blood-stained," but it has never pinned its faith to it as a financial instrument to the same degree as the Democrats, who have been the real devotees of cheap money until they were pushed from the altar by the Populists. The writhing of the silverites as they see their faction dwindling is perhaps the most encouraging feature of the caucus. Mr. Bland saw the ground slipping from under his feet, and he could do nothing but utter disconnected cries of "National banks," "Sixteen to one," "Money of the Constitution," etc.; but he got no attention. The Democratic party has broken away from his lead completely.

Mr. Bourke Cockran is the first Congressman, we believe, to question the commonly accepted saying that the greenback is operating like an endless chain of buckets to take gold out of the Treasury. This idea was suggested by Secretary Carlisle, in his annual report, in these words:

"One of their most obvious effects is to defeat all attempts of the Treasury to procure and keep constantly on hand a sufficient amount of gold to inspire entire confidence, at home and abroad, in the ability of the Government to preserve its own credit and maintain a sound currency for the use of the people. Frequent issues of bonds for the purpose of procuring gold, which cannot be kept after it has been obtained, will certainly cause increased distrust," etc.

There are two facts to be weighed in examining this subject: first, that the $100,000,000 gold reserve which was accumulated in 1878, was never disturbed by this chain of buckets as long as the Government had a surplus of income over expenditure; (2) that the recent drain upon the gold reserve has been just about equal to the deficit of revenue and has gone on *pari passu* with the deficit. Now let us suppose that the legal-tender note should cease to exist to-morrow. There is no longer any chain of buckets by which the public, the banks, or the gold-exporters can draw the yellow metal from the Treasury. Will the secretary be able, therefore, to protect his gold reserve? Not if he continues to pay his daily expenses. It is true that his receipts will now be largely of gold, perhaps wholly so, because if $500,000,000 of paper were suddenly taken from the circulating medium, the demand for instruments of exchange would absorb all the existing silver certificates and banknotes, and more. But if the secretary's income is less than his outgo, he must take the difference out of his gold reserve, and if the deficit continues many months, he will be on the market for a new loan. So it appears that the greenback, although guilty in many ways, is not guilty as charged in the secretary's indictment. While Mr. Cockran expressed doubts whether the greenbacks were operating in the particular mode described, he considered them an unmitigated evil, and urged that they be treated as other Government debt is treated—that they be funded into interest-bearing bonds and extinguished. This is the fundamental condition of currency reform.

If the retirement of greenbacks is the fundamental condition of currency reform, it may be asked why the Baltimore plan ignored it. This is a very proper question, and it was fittingly answered by Congressman Hendrix in the debate on Saturday. The Baltimore bankers did not seek to regulate the Government's financial policy apart from the banking question. They limited themselves to the mode of issuing, securing, and redeeming banknotes, leaving the question of legal tender to be settled by Congress in its own way and time. Probably the bankers took the view that if they asked for the retirement of the greenbacks, they would stir up a host of enemies who would say that they were trying to clear all other currency out of the road in order that they might monopolize the field and fasten themselves like bloodsuckers on the community. Important reforms are sometimes defeated at the first onset if a charge of personal self-interest can be brought against their advocates. There would be just sufficient plausibility in such a charge to convince many people that the Baltimore plan was founded in the private greed of a comparatively small number of men, than which nothing could be more destitute of truth. For this reason, we presume, the greenback question was not touched upon. Yet it is undoubtedly true, as Mr. Hendrix said, that the Baltimore bankers, without a single exception, desired the retirement of the greenbacks, and have so desired ever since the close of the war.

The documents sent to the Senate on Thursday by the President in regard to the Bluefields affair mark the happy settlement of a long-standing and vexatious diplomatic controversy. For fifty years the protectorate asserted and exercised by Great Britain over the Mosquito Indians has been in one way and another an annoyance to our State Department, owing to its effect upon our relations with Nicaragua. Our treaties with Colombia, leading to the construction of the Panama Railway, and with Nicaragua, giving the right to build an interoceanic canal, in their turn led up to the Clayton-Bulwer treaty, which has long been a thorn in the flesh of our State Department. Now all the entanglements are cleared away at one stroke, through England's amicable agreement to renounce her protectorate over the Mosquito Coast, and the full assumption of sovereignty over that strip of territory by the Government of Nicaragua. This peaceable diplomatic achievement has left the Jingoes speechless.

Senator Aldrich rashly charged on Friday that the President was intriguing with Hawaiian royalist commissioners last summer, and that it was at their request that our war-ship was ordered away from Honolulu. Mr. Cleveland says, however: "I never saw any member of this commission or committee, and have never had any communication or transaction with any of them directly or indirectly"—except to write them a note saying he could do nothing for them. But if the President thinks to silence the patriots in that way, he is greatly mistaken. The *Tribune* says of the above statement that it has a "characteristic lack of directness and perspicuity." What would seem direct and perspicuous to this editor we cannot say, but he would not be satisfied in any case, for, as he adds, why did the President "keep quiet" about the affair so long if there was no treason hatching?

The patriots will be equally distressed by the latest news from the islands. The Government is not "solicitous" about having an American ship in Honolulu, as Lodge vows that it is, although if one came it "would be very welcome." They would not fire on it. Worse than that, the British ship "sailed away on the 27th," and the new British commissioner "maintains most friendly relations with President Dole." About the only comfort left for patriotic hearts is the fact that the English bishop in Honolulu still refuses to pray for the President of the Hawaiian Republic. This is distinctly hostile, in the case of a man so much in need of effective intercession, and if "Alfred Honolulu" will only keep on denying the Hawaiian Government all benefit of clergy, we may get the islands yet.

There are hints from Washington that an appropriation will not be made at present to pay to Great Britain the sum agreed upon by the two governments for the settlement of the Bering Sea claims. A failure to make the appropriation would not necessarily imply a repudiation of the treaty, but it would be a repudiation of that part of it which provides that the award, whatever it be, "shall be promptly paid." The fact is, that though provision was made in the treaty for the assessment of these damages, the Tribunal never passed upon them. The British made out a full schedule of their losses, and Judge Blodgett, on the American side, made an argument on them which showed that they were much exaggerated; but they were never adjudged by the Tribunal. In truth, in the opinion of our counsel, not over a third were good claims. It seems a pity, therefore, that Mr. Gresham should have come to an agreement to pay them without further inquiry. But his excuse is that they are not worth the expense of further inquiry. To examine them thoroughly would cost more than they are worth. What ought to be done in such a case it is hard to say, but the opportunity for a compromise or splitting of the difference seems a good one.

The most easy and simple way of increasing the national revenues would be by doubling the present tax of $1 a barrel on beer, as proposed in the bill introduced by Mr. Money of Mississippi in the House on Thursday. It would not raise the price of beer by the glass to the consumer, and would merely reduce the present inordinate profits of the brewing industry, while it would add fully $30,000,000 a year to the income from the internal-revenue bureau, without requiring any new machinery for the purposes of collection. In short, there is every argument for it from the standpoint of the public interest. Nevertheless, there is little reason to hope that the plan will be adopted. Both parties have always feared to offend the brewing interest.

The prohibition of American cattle and beef at the port of Antwerp on the ground of pleuro-pneumonia is clearly a protectionist move on the part of the Belgian Government. It is probably the result of a combination of cattle-growers and butchers, resembling the combinations that have been made at different times in this country to exclude dressed beef from particular States, and to require all animals intended for food to be slaughtered on the ground. These local statutes were quashed by a Supreme Court decision, since when we have been free from that kind of interstate protectionism. There is no supreme court that can help us in this case. Nor can we make any effective protest, since we have indulged so liberally in protectionism ourselves. Retaliation will probably be resorted to after a time, although that is always foolish, and generally ineffectual. If Belgium hurts us in the matter of our sales, that is no reason why we should hurt ourselves in the matter of our purchases. But all nations resort to retaliation except Great Britain. It looks as though the latter were the only real friend, in the commercial sense, that we have in Europe. Distressing, but true!

Mr. Carroll D. Wright has an article on our last summer's labor troubles in the January *International Journal of Ethics*, in which he says many things which are wise and sound and some which are otherwise. Contradicting the opinion given in the report of the commissioners (of whom he was one, and presumably *magna pars*) who investigated the Chicago strike, he admits that arbitration is impossible in the case of a sympathetic strike, "because the sympathetic strikers have no grievances which can be arbitrated." This being so, and the sympathetic strike being the only kind that is any longer so formidable as to require state intervention, we cannot share his hope that great good is to result from "the application, through various officers, voluntary and statutory, of the principles of conciliation and arbitration." For the ordinary strike no cumbrous machinery of arbitration is necessary, and to the extraordinary, sympathetic strike Mr. Wright confesses that it is inapplicable. He would reduce all strikes to a "principle" which is "at stake." This need not be quarrelled with, but what is to be said of a writer who adds, "We need not, in this connection, take into consideration the violence, the rioting, the destruction of property which accompany some great strikes," because these are only "incidents"? We have had one judicial decision that violence is of the very essence of a railroad strike. And, what is more, this decision of the much-abused Judge Jenkins was strictly based upon the evidence in the case before him. The labor-leaders frankly admitted, under cross-examination, that their strike contemplated violence from the beginning, and that without it they would have had no hope of success. But, this aside, any man not asleep or in the Department of Labor must know as a matter of fact that all the great strikes which disturb the public peace are essentially violent. That is the only reason they do disturb the public peace. It is because the peaceable strike of other days is now almost unknown that social philosophers are so much concerned about the existing violent type. We do not think that the social philosopher who starts out by ignoring the violence, or calling it only an "incident," will get on very far in his solution of the difficulty.

It is impossible to regard the election of Hamilton Fish to the speakership of the New York Assembly as anything less than a public calamity. He owes his selection entirely to the fact that he is Platt's man. For several years he and Platt have been bitter enemies, but they "came together" this year for mutual profit. Both have been Tammany dealers for at least ten years, and Fish has held public office by Tammany favor during a greater part of that time, being at the present moment one of the appraisers of property condemned in the Croton watershed by Mike Daly, the celebrated water-purifier. Fish owes his nomination to the efforts of "Lou" Payne, the Platt agent of whom a Republican Albany correspondent declares: "This is the same 'Lou' Payne who was ordered out of the Speaker's room last winter, who was denounced as the tool of Tammany Hall, and who was mercilessly assailed by almost every newspaper in the State for opposing the reduction of the $75,000 fees of the Tammany sheriff of New York city." All these circumstances and facts make it plain that the Assembly is to be under the control of Tammany "dealers" who have, during their political careers, preferred to share the profits of corrupt politics with Tammany rather than to antagonize and defeat Tammany. Mr. Fish's selection must be interpreted by the honest people of this city as a distinct and formidable menace to all genuine reform plans.

The last Legislature of this State was prevailed upon, by the plea that American citizens were being ruined by the cheap labor of unnaturalized aliens, to pass a law requiring that all laborers employed in the public works of this city should be citizens. The consequence is that nobody can be employed in even the most menial occupation unless he either is a native of the United States, or, if born abroad, has been naturalized. The effect of this restriction has been that the commissioner of street-cleaning could not get laborers enough after the December storm to remove the snow, and it is not gone yet.

There never was any such trouble before, and it is entirely due to the provision of law that confines employment to citizens. Citizens can do so much better at something else than cleaning streets that not enough can be found to do the work in any emergency like that created by a hard storm; and as only citizens can lawfully be employed, the work must go undone.

The principle here involved extends far beyond the streets of this metropolis. If it is right that only citizens should be employed in the public works of this city, unnaturalized aliens should also be debarred from service in digging sewers, working mines, constructing railroads, and in all other branches of unskilled labor. Other places are, of course, as much injured as New York by the spectacle of a man engaged in menial work who is not a citizen, and the rule should be universal if it is maintained at all. Everybody familiar with the subject, however, knows that enough citizens could not be found to do the work that needs to be done throughout the country if such a rule were enforced. Originally the Irish were chiefly depended upon for construction work on railroads, but nowadays the Irishman who has been here long enough to become a citizen is seldom willing to take such a place. The Italians and men of other races who are now employed did not supplant the Irish; they simply filled vacancies left by the Irish. It is usually taken for granted that the only reason contractors have for employing aliens is because they can hire them more cheaply than citizens; but it is frequently the case, as with the commissioner of street-cleaning in this city during the past fortnight, that they cannot get citizens on any terms. Many advocates of restricting immigration say that, if they could, they would stop it entirely. If this could be done, within five years we should see the industrial development of the country arrested, because we could not find in the United States men who were ready to do the work that must be done. Everybody agrees that the criminal, the pauper, and the insane classes of foreign nations should be debarred admission to this land; but when we say that the man who is ready to come here and shovel snow, dig sewers, and work in mines shall not come, we disarrange the whole machinery of the industrial world.

Any criticism which is passed on Dr. Parkhurst's recent attack on Byrnes must be based on its untimeliness. It must be due to the belief that he has spoken too soon, or that it is undesirable as a matter of policy to create an appearance of division in the reform ranks, in the presence of the apparent predominance of the spoils element in the organization of the Legislature. But these are minor considerations. If we are to have, as the sole result of our fiery rising, another "bi-partisan police board," and a reorganization of the force conducted under the supervision of Byrnes, who owes so much money to one of the most corrupt sources of wealth this country has ever seen, Dr. Parkhurst has not spoken too soon and cannot speak too loudly. We do not know whether there be any intention in any quarter to employ Byrnes in the work of reorganizing the police force, but no force which he would reorganize, composed of men on whose character he would pass, could possibly command the confidence of the public, or could possibly in the long run turn out much better than the one it is proposed to disband. If we get Byrnes to reorganize, or have anything to do with the new force, it will be tantamount to the approval of the secret accumulation by a police officer of a large fortune during his term of service, through gifts from Wall Street speculators—the rascally as well as the decent—for services he dare not name. Can we afford to make such an announcement to our new or reformed policemen? If Dr. Parkhurst sees any chance of this, he ought not to be silent. Better have his discretion assailed than his honesty or public spirit.

Recorder Goff's first official act is of itself ample justification of his election to the bench. He issued an order for the removal of all indictments from the custody of the district-attorney's office, and the placing of them in the custody of the clerk of his own court. He said that the present practice, which has prevailed for many years, of leaving the indictments in the care of the district attorney was "entirely without warrant of law," adding:

> "These papers are a part of the records of this court. I have consulted with my associates, and they agree with me that it is a practice that should be stopped. It is therefore ordered that every indictment shall be filed and remain with the clerk of the court. It is further ordered that the clerk shall keep a record of the indictments and of every movement or process concerning the indictment; also that the clerk shall keep a record of all bench warrants issued out of this court on or regarding such indictments."

Everybody at all familiar with the district-attorney's office is aware that an irresponsible official, known as the indictment clerk, has really been the custodian of these indictments for many years, and that he has been almost or quite the only person in the city who knew anything about them or exercised much control over them. He could pigeon-hole almost any one of them and few persons would be any the wiser for it. The practice has been an abuse of the most far-reaching character, and in abolishing it the new recorder has done more at a single stroke to sever the control of criminals and lawbreakers over the prosecuting legal machinery of the city than could be accomplished in any other way. There is not a criminal in the city who will hear the news of this transfer without a shudder.

There will be a general concurrence in the wisdom of the position regarding consolidation taken by Mayor Schieren of Brooklyn in his annual message. Public opinion in that city was almost evenly divided on the question, as far as the vote at the November election indicated, the affirmative majority being only 277, in a total poll of more than 129,000, while almost one-fourth of those who voted for Governor cast no ballot on the annexation issue. Moreover, since the election a considerable opposition to the proposed union has developed, the promoters of which might evidently have turned the majority in November the other way if they had been as active then as now. Mayor Schieren takes the ground that the result must be accepted as a settlement of the question whether the cities shall be consolidated; but as the majority was so small, and the opposition is still so active, he thinks that any hasty action is to be deprecated. He holds that it must be a work of time to prepare a comprehensive charter for the different municipalities which are to form "the Greater New York." He endorses the suggestion of Governor Morton that a commission be created by the Legislature to discharge this duty, although he would not have it try to report its results until a year hence. A deliberate policy of this sort will suit the New York public. It has been settled that the cities are to be consolidated, but there is not the slightest necessity for any hurry about the matter.

It is not often that financial complications take on so peculiarly distressing a form as they have assumed in the colony of Newfoundland. Before the bank failure of December 10, the notes of the two banks at St. John's were virtually the only circulating medium of the island. Both of these banks suspended, and the condition of each proved to be that of insolvency. This, it is easy to see, presented a very different problem from the suspension of specie payments, such as happened with us in 1857 and 1861, or the temporary suspension of cash payments on checks, such as characterized our panics of 1873 and 1893. Even had all our banks, in July, 1893, refused to redeem depositors' checks in cash, it was nevertheless well known that the banks were intrinsically solvent. Certified checks, therefore, even on such banks as withheld cash payment, continued to furnish a medium of exchange. At a trifling discount they were exchangeable for cash in brokers' offices. Banknotes were actually at a premium. In Newfoundland one at least of the two banks of issue is a hopeless wreck; the solvency of the other is extremely doubtful. The problem, moreover, has not been one of money-hoarding. There is virtually no specie in the island except the meagre reserves of the fallen banks. The only currency in existence is the promises to pay by institutions which will probably never be able to redeem their promises.

ELECTORAL REFORMS.

THE tone of Gov. Morton's first message is in most refreshing contrast to anything of the kind that we have had from the executive chamber at Albany for ten years. For the first time in all that period there is the accent of sincerity in the utterances of a Governor concerning what he considers to be his duty towards the people of the State. No matter what Gov. Hill or Gov. Flower might say upon any great public question which was to come before the Legislature, everybody familiar with the actions of the two men knew that in the end the course adopted would be the one which was most conducive to the advancement of machine politics. However plausible the moral sentiments of the Governor might sound, everybody was perfectly well aware that they were to be withdrawn into the background when the time for practical legislation should arrive. It was always thus in regard to ballot-reform and corrupt-practices legislation. Both Hill and Flower had an abundant supply of favorable views for those measures, but they were never able to give their approval to any form of them that the Legislature passed which was unacceptable to Tammany Hall and the Murphy-Sheehan-McLaughlin machine.

Gov. Morton's deliverances on these subjects are more sincere in tone, and they command a hearing because of the belief that he will be amenable to reason and morality in deciding what course he will pursue when he is free to act. No greater waste of an intelligent man's time was ever made than in asking him to appear before Hill or Flower with a rational argument in favor of any measure. Neither of those men had any other conception of the executive veto power than to use it as a club over the members of the Legislature to compel their support of political measures. Gov. Morton has a few well-expressed words at the opening of his message which give assurance that he will not use that power in that way. "The chief executive," he says, "should never use it [the veto] as an instrument to aid in impressing or imposing his will upon the Legislature, nor should it be invoked to serve personal or partisan ends." Hence his views upon prospective legislative methods are to be regarded as pledges by him to consider them solely upon their merits, and approve or disapprove them according as he shall be convinced of their public desirability or usefulness.

What the Governor says about ballot-reform and corrupt-practices legislation accords with the demands of the people for honest and secret elections. He favors the adoption of a blanket ballot, with party columns and emblems, and without the blanket "paster"; single-name or individual "pasters" alone to be permitted. Two bills providing a blanket ballot in conformity to this suggestion have been already introduced. One of them is the Sheffield bill of last year, and the other a new measure which Senator Raines seems to have prepared. The Sheffield bill provides for a system similar to that recommended by the Governor. The Raines bill provides the blanket ballot recommended by the Governor, but, instead of allowing single-name "pasters," provides that illiterate voters shall be allowed to take two election inspectors into the booth with them, one to represent each political party, to assist in preparing his ballot. That is a thoroughly vicious provision which ought to be stricken out without ceremony. It would simply amount to allowing the bosses and corruptionists to keep tab upon the voting of every bribed voter, ascertaining surely that he keeps his bargain. There is one point about the Sheffield bill which ought to be considered carefully. As it stood last year it permitted a voter to vote an entire party ticket by placing a single mark in a space reserved for the purpose at the top. This plan has been in operation in several States, including Iowa, Ohio, and Pennsylvania, and in all of them it has worked so badly that there are general demands for its abolition. There is practically unanimous agreement that this single mark leads to confusion, that a dishonest inspector who is deft with his pencil may place a second mark over a party column while smoothing out the ballot, and thus cause the vote to be thrown out, and that the fairest and surest way is to require the voter to check the name of every candidate in the column. With the party name and symbol at the top, even the illiterate voter has no difficulty in doing this.

In addition to the introduction of two ballot bills, Senator Parsons introduced a bill authorizing the use of the Myers voting-machine in New York city and Brooklyn, and another bill authorizing its use in all counties in which a majority of the towns have adopted it. This will bring the question of the use of the machine before the Legislature, and we trust will be the cause of a full and intelligent inquiry both into its merits and into the practicability of adopting it for general use in next fall's elections. We observe that the *Tribune* quotes a "prominent man who has given the machine much study" as saying that the machine provides no method by which a voter may vote for a candidate whose name is not on the regularly nominated tickets. This prominent man's "study" has not been carried very far, or he would have known that the machine has an admirable device to meet this contingency. It presents a blank space, with a knob, in which the voter may write any name he chooses or put on a paster. When he has done this, he presses in the knob, which becomes locked and remains so until the voter has left the compartment, when the name disappears, leaving a blank again in its place. All the names thus inscribed are preserved upon a continuous roll of paper, and when the machine is opened, this roll can be taken out, and the inspectors will find upon it the entire "scattering" vote of the election.

Gov. Morton's recommendation that the corrupt-practices act be so amended as to include campaign committees, as well as candidates, in the requirement of sworn publication after election of all money received or expended, is in the line of a reform which has been greatly needed for many years. We think that the law should be amended in other directions also—that it should place maximum limits to the legal expenditures of all candidates, graded according to the office, and that the legal and illegal expenditures should be specifically defined. Then, too, some method ought to be adopted by which contributions from corporations, made either to candidates, campaign committees, or bosses, could be forced into the light of day. This is the evil which at present dominates all others, for it furnishes the sustenance upon which bosses like Croker and Platt are able to maintain their power. The present corrupt-practices act is, in fact, too inadequate a measure to be made of practical use by mere amendment. It should be thoroughly and completely overhauled and revised, and a new measure evolved on the pattern of the Missouri act, which is the best American adaptation yet made of the English act of 1883.

INTERNATIONAL INTERFERENCE.

THE London *Daily News*, commenting recently on the horrible lynchings in the State of Georgia, said it was lucky for the United States that their representative had been kept off the commission to inquire into the Armenian outrages. If Consul Jewett had protested at what had occurred at Sassun, his mouth would have been closed by any shrewd Turk who chose to fling back Alabama or Georgia crimes at him. The Kurds have as good ground for memorializing President Cleveland about the state of the South as he has for approaching the Sultan on the subject of what is going on in Armenia. These views of our amiable British contemporary raise the whole question of international interference, its grounds and proprieties.

International law has no precise and certain rules respecting this question. How to reconcile the right or practice of interference with the right and recognition of independent sovereignty is about as tough a problem as the theological one of harmonizing divine decrees with human freedom. It is not strange, therefore, to find, as a matter of fact, that interference of this kind has never been practised except in the case of weak or semi-civilized nations. The interference is practically a denial of full sovereignty. Yet, even so, interference must have a suitable occasion. The one most commonly laid down, and fitting the Armenian case, is interference on the ground of humanity — interference when, as Woolsey says, "Some extraordinary state of things is brought about by the crime of a government against its subjects." This was

the reason and the only justification of the interference of England, France, and Russia on behalf of the Greeks in 1827, and of Russia in the interest of the Bulgarians in 1877.

Now, looking solely at such action as the action of a nation, there is no provision, either in law or in history, that the interfering power must itself be beyond reproach in all respects. Russia could interfere to rescue the Greeks from the murderous Turk even though she had millions of serfs at home. England's interference could not be headed off by allusions to Catholic disabilities or Irish misgovernment. In short, the case of a nation is very much like that of an individual. A man has a right to lay hold of a ruffian who is beating a child in the streets, even if he himself has been heard to speak crossly to his wife. If all crime, national or individual, had to go unwhipped until an impeccable judge arose to inflict punishment, even such rough justice as we have would soon cease to exist. The *Daily News* lets go no occasion to tell the world that England is guilty of monstrous injustice towards Ireland, and perhaps of even grosser injustice towards workingmen; yet this does not operate as a bar to Great Britain's interfering in behalf of the Armenians. This matter of asserting that a nation's hands are perfectly clean is, as Dean Church remarked apropos of the disestablishment of the Irish Church, an extremely ticklish business.

But the real source of confusion of ideas on this and kindred subjects is the conception of a nation as a personality in and of itself, instead of as a collection of personalities of differing intellectual and moral standards. The moment we drop the old realistic definition of a nation as an abstract entity apart from the flesh-and-blood people who really compose it, most of the difficulties under consideration vanish. Take the case of American protest against the Armenian outrages. It is not the American nation that makes the protest, but a certain number of American citizens. The question of consistency in the protest, therefore, comes down to the question of the consistency of these individual protesters.

Some of them, we are bound to say, cannot be allowed to bring any moral significance at all into the case. They are the professional protesters, so to speak, to whom all outrages are a godsend, and who are ready at a moment's notice to protest, appeal, or lament, on any platform, in respect to any outrage the broad earth over —their own notoriety-seeking excepted. They are essentially non-moral quantities and hence negligible here. But, as far as we have observed, the persons most active in stirring up popular sentiment in the Armenian affair are not of this class. They are rather the citizens who, in various parts of the country, stand for what is highest and best in morality and education and philanthropy. They are men preëminently humane, and thus precisely the ones to raise their voices in the name of humanity. Can their mouths be shut by reference to negro-hunters and lynchers in the South? Not at all, for they speak out as clearly and strongly against those domestic assassins as they do against foreign ones. Their moral indignation is not of the kind which varies directly with the square of the distance, but burns as hot against present-day and native villains as against historic criminals or ruffians conveniently remote.

In such men and in the moral standards they represent we see international interference, from motives of humanity, in its most powerful form. Gladstone is now no part of the English Government, yet his short speech the other day on the Armenian persecution carried more weight than any official utterance possibly could have. It is because he speaks, not for the English nation or any other, but for what is best in civilization, that his words are watched for more eagerly than those of the Premier. In his case, and in that of men who have something of his moral elevation, the little flings about charity beginning at home and dwellers in glass houses, lose all point, as their humanity has nothing national or racial about it, but finds its country in the whole world and its fellow-citizens among all mankind.

THE USE OF GREAT FORTUNES.

We have received an interrogatory communication from a Kansas judge, which begins by asking whether "the existing concentrations of vast wealth in the hands of individuals are unjust." The answer to this depends on the meaning we attach to the word "justice." If we mean, Have all these concentrations of vast wealth been lawfully and honestly acquired? we answer, In many cases probably not. But this is as true of small fortunes as of large. It is, in a measure, true of all property. A large proportion of all the property in the world has been acquired, at least in part, by means which the strict moralist must condemn, or, in other words, "unjustly." The object of churches, schools, and works on ethics, is to keep down this proportion as much as possible. The possibility of completely extirpating unjust methods of acquiring property is hardly a subject for speculation among practical men. The socialist plan of collectivity has to contain a vast army of officials who would be no more honest or efficient than the rest of mankind, and would undoubtedly steal and lie in the old-fashioned way. We owe our immense fortunes in this country to the sudden development of untouched resources in various fields, aided, no doubt, very often by chicanery of some kind; but there is no cure for this which would not be worse than the disease. The maker of a large fortune is, as a rule, a man who has had more sagacity than other people in discovering and supplying a public want. To despoil such a man would deprive us of services of inestimable value to civilization, even if he were sometimes a knave. To despoil his children would discourage all other fathers of like talents and opportunities.

To the question whether such fortunes are "detrimental to the public welfare," we answer, As a rule, no. The portion of the income spent in luxury is considered waste by economists, but it does employ labor, and, through encouragement to the arts, is often of great help to civilization. But no income can come from large fortunes except through investment in some enterprise useful to the public, as is proved by the profits or interest; and the owner is apt to be a man skilful in finding out what the public wants, and therefore a good man to have control of large sums of money. One way in which such concentrations of vast wealth do obviously become injurious to the public welfare is their use in resisting blackmail at the hands of poor politicians and legislatures. They are used freely in debauching legislatures and buying up office-holders for defensive purposes. The remedy for this is, however, in the hands of the poor.

"How much is annually paid to citizens of foreign countries for interest, etc.?" We do not know. The amount is certainly large. We are quite sure it is never paid unless it is honestly due on loans or investments. A large amount that is honestly due is never paid, owing to the failure of enterprises or the dishonesty of managers. We think the public interest would be promoted by the increase of this annual payment, because it would show both that more foreign capital (our great want) was flowing into the country, and that our industries were flourishing. We would bring about this increase partly by the establishment of a sound standard of value, acknowledged to be such by all the world, partly by increased honesty in the management of our various industrial enterprises, partly by improvements in city governments, the present condition of which frightens foreigners, and partly by the abstinence of Congress and State Legislatures from attempts at barbarous and blackmailing legislation. The notion which many people, especially Populists, undoubtedly have, that the foreigner who draws an income from American investments can do something to us if he does not get his money, is an hallucination. What happens is that he goes without his money, and swears at us, while we enjoy the commodity which his wealth has created.

Let us say, also, that, strictly speaking, we send very little money abroad. This is one of the major Populist errors. We pay our debts abroad by the export of goods. People who owe money in Europe, buy bills of exchange from dealers, who export goods to meet the exchange, so that the debt is really paid in European money. Our net exports of gold last year were only, in round numbers,

$4,500,000, of silver $37,000,000, while our exports of goods were $847,000,000, and we were producers of both gold and silver. If the people of Kansas had spent as much time during the last two years in studying the laws of trade and exchange, which are really laws of human nature, as they have spent in listening to Populist harangues, Kansas would be a far happier and more prosperous, as well as a more respected, community than it is.

What is wanted most of all, especially in the community in which Judge Allen resides, is a stricter attention on the part of each man to his own business, and a diminished occupation with the affairs of the world at large. Statistics—custom-house and other—do more or less mischief in democratic countries, because they help to conceal the fact that the trade, commerce, and industries of a country are made up of thousands or millions of individual transactions, on each of which the best authority in the world—the man who is to profit or lose by it—has passed judgment. We owe most of our "crazes" to the notion that every voter ought to have a say about the way everybody else does his business.

ALEXANDER IRELAND AND EMERSON.—I.

NEW YORK, January 1, 1895.

WERE Ralph Waldo Emerson living, he would send the choicest flowers of his garden to be laid near "the sweet heart of Alexander Ireland"—to recall an expression in one of his letters to me. The wreath must now pass from grave to grave; and if I venture to bear it, though it may seem but faded autumn leaves to the younger generation, it is because the eventualities of life have brought within my personal knowledge facts not likely to be known to any other survivor concerning the relationship between the men. There are already before the world, scattered through pages of the Carlyle-Emerson Correspondence, Ireland's volume on Emerson, and mine also, items which, pieced together, would sufficiently disclose a literary episode of international interest sprung from the casual meeting of the two in early life. But all that has yet been printed leaves too much in the background the unpretending Englishman who was nearly the first to discover the genius of Emerson, who wrote of him: "At the landing in Liverpool, I found my Manchester correspondent awaiting me, a gentleman whose kind reception was followed by a train of friendly and effective attentions which never rested whilst I remained in the country. A man of sense and of letters, the editor of a powerful local journal, he added to solid virtues an infinite sweetness and *bonhomie*. There seemed a pool of honey about his heart which lubricated all his speech and action with fine jets of mead" (*English Traits*).

Alexander Ireland (born at Edinburgh, 1809, died at Fallowfield, December 9, 1894) was of good family and well educated. Although he early entered on a business career, he was devoted to books, and one of his friends remembers his transcribing the whole of White's 'Selborne' from a longing to own a copy. His hero was, of course, Sir Walter Scott, and perhaps the best introduction I can give him to many readers will be the following reminiscences in one of his letters to me (1871):

"I heard Robert Collyer three times, and he supped at the house in Liverpool where I was staying. He is a noble and true man. I liked him much, and I honor him for his manly and plain outspeaking

"Now about Scott. I have sent you three little books, which may be interesting to you to look over. I enclose a letter I wrote to the *Scotsman* about a painfully interesting lithograph I have of him, from a painting by Knight I often went to see him sitting in the Court of Session below the bench, and used to wonder how all those marvellous creations could have emanated from that brain of his. After reading one of his novels I would go up to the court and feast my eyes on him. On one occasion I had an opportunity of speaking to him—or rather I had the luck to be spoken to by him. A friend who was going to Galashiels in a gig, on a commercial journey, offered to drive me there and back; so I thought I would seize the chance of seeing Abbotsford. It was in 1828. The place was not shown when he was at home, but as I had seen him the day before in court, I presumed he would not be at his home On presenting myself at the door a servant told me he could not admit me, as his 'Maister was at hame and naebody could be admitted when he was there.' At this moment Scott came into the hall on his way out to the grounds, and on seeing me he asked the servingman what I wanted. I told him I had come out from Edinburgh to see the place, not being aware that he was at home, as I had seen him in court the day before. He smiled and said, 'Let him see everything that is to be seen. You are welcome to see the place, sir.' He then passed on, his dogs gambolling about him. He looked hale and hearty—was dressed in a black and white checked shepherd's plaid suit, and had a belt on, stuck full of knives, hedge-bills, little saws, etc., for cutting and pruning timber.

"I knew James Laidlaw, an Inverness-shire farmer, brother of Willie Laidlaw, Scott's factotum He was a heretic in religion, and he visited at Robert Chambers's in Edinburgh, and many a pleasant hour I had with him over our toddy after supper. I remember his telling us an anecdote of Scott, who had been dictating to Willie Laidlaw, and somehow the doctrine of Atonement was touched upon. Scott broke out in denunciation of it, walked about the room in a vigorous manner, and said he wondered how any one could believe in such a doctrine.

"In 1859, at the Burns centenary, an old man, turned 100, came on the platform and recited 'Tam o' Shanter.' He had known Burns. My aunt, a venerable lady who died some ten years ago, danced many times with Burns at a public hall in Edinburgh, when he was all the rage there. I once took Burns's two sons to see this old lady, and they chatted for an hour, to the great delight of all the three. She has often told me about his appearance and manner of dancing."

These casually written notes indicate the atmosphere in which Alexander Ireland's youth was passed. At his hospitable fireside in his home, "Inglewood" (at Bowden, near Manchester), I have often listened to his early memories, but they always led to the most cherished of all—the day when he first heard the voice of Emerson. His ideal of pulpit eloquence had been filled by Chalmers, but one Sunday (August 18, 1833) he happened to attend the Unitarian church (Edinburgh) and came under a new kind of spell. Ireland never told me the subject or purport of Emerson's sermon, but the charm of it, the sweetness of voice, the absence of oratorical effort (in such contrast with Chalmers), the calm dignity and simplicity with which the original thoughts were uttered, remained with him to the end of life. Even within the past year, his eighty-fifth, I saw the youthful fire in his eyes when he referred again to that discourse heard in his twenty-fourth summer. But a greater joy awaited him. Emerson was not yet an author, he was totally unknown in England, and a professional gentleman of Edinburgh, to whom he brought a note of introduction, unaware that an angel had arrived at his door, turned him over to a young friend to be shown the sights of the neighborhood. This young friend was Ireland. Emerson was but six years older than his guide, but seems to have impressed the youth in much the same way that he did those who gathered around him in Concord twenty years later.

"He spoke on many subjects connected with life, society, and literature, and with an affluence of thought and fulness of knowledge which surprised and delighted me. I had never before met with any one of so fine and varied culture and with such frank sincerity of speech. There was a graciousness and kind encouragement, too, in his manner, inexpressibly winning to one so much younger than himself; and it was with a feeling akin to reverence that I listened to and drank in his high thoughts and ripe wisdom. A refined and delicate courtesy, a kind of spiritual hospitality, so to speak—the like of which, or anything approaching to which, I have never encountered—seemed to be a part of his very nature."

These words are from Ireland's little book on Emerson, where four pages are given to what the American told him about literature, and great men, some of whom he had just been visiting, and others (Carlyle and Wordsworth) he was about to visit. He strongly advised Ireland to write down his ideas, and the youth straightway began with "memoranda of that brief intercourse, written in a strain of youthful, enthusiastic admiration, and of perfectly confident expectancy as to his future—a strain which might at that time have sounded very inflated, but which his subsequent career may be said to have rendered almost tame and inadequate."

Although Carlyle's voice had reached Emerson, he was as yet so little known in his own country that Ireland remembered "the almost insuperable difficulty" of ascertaining where he lived; but at length the traveller went off to Craigenputtock, and a week later his young friend at Edinburgh was enriched by a long letter (printed from the original in my 'Thomas Carlyle') written from Liverpool, giving him a careful account of the visits to Carlyle and Wordsworth. Emerson had travelled far to meet the men whose thoughts had influenced his intellectual life. "Leave thy temple, and search for a heart," says Omar Khayyám. Emerson had resigned his pulpit, had visited great men, but did not find in any of them the heart he sought. But he knew that he had touched a true heart in the Edinburgh youth, and wrote to him, just as he was starting for America, inviting a visit. "I cannot think of sketching even his [Carlyle's] opinions, or repeating his conversations here. I will cheerfully do it when you visit me in America." "I noted down some of these [exhortations of Wordsworth] when I got to my inn, and you may see them in Boston, Massachusetts, when you will. I enjoyed both my visits highly, and shall always esteem your Britain very highly in love for its wise and good men's sake. I remember with much pleasure my visit to Edinburgh, and my short acquaintance with yourself and your good parents. It will give me great pleasure to hear from you, and to know your thoughts. Every man that ever was born has some that are peculiar. You have found out the virtues of solitude, I remember with much pleasure." He subscribed himself, too, "Your friend," which thrilled young Ireland's heart, and but for limited resources it is probable that the youth would have become the first of the many pilgrims from England who found their way to Concord. But the future held something more picturesque and more impor-

tant than any such pilgrimage; and Emerson, who returned home to break the last clerical bonds, realized in the end the further saying of Omar: "A thousand chains broken by thee are less than to have chained to thee, by sweetness, a true heart."

Whatever spiritual bonds had remained on the Edinburgh youth softly fell away, after Emerson's touch, and his mind was gently revolutionized. He kept steadily at his business, and by increasing means earned the more leisure for literary studies, whose extent is known to the fortunate possessors of his 'Book-Lover's Enchiridion,' his 'William Hazlitt, Essayist and Critic,' and 'A List of the Writings of William Hazlitt and Leigh Hunt, etc.,' under whose bibliographical title is hid a wealth of information which made Emerson describe it as "a work of loyalty and good taste, so thoroughly and accurately performed that it will be the *liber veritatis* and *liber studiorum* for all lovers of Lamb and Hazlitt and Hunt, now and hereafter." But he was never ambitious of literary fame. During the ten years following Emerson's visit of 1833, Ireland remained at Edinburgh, happy in his books, in his German flute—on which he played Scotch airs finely enough to be remembered in Sir William Chambers' autobiography—above all happy in his circle of friends. Among these were Robert and William Chambers, Robert Cox (author of an encyclopædic 'Literature of the Sunday Question'), Dr. William Smith, who first introduced Fichte to English readers, and is to-day the venerated President of the Edinburgh Philosophical Society, and Dr. Hodgson, late Professor of Political Economy in the University of Edinburgh—who always wrote to Ireland as "Bro. Alex." (Hodgson's letters to Ireland were counted: there are as many as 5,000.) I have known all of these gentlemen personally, and have heard from them affectionate memories of Ireland. They used to ramble together in the beautiful solitudes, discuss high themes at Arthur's Seat or Salisbury Crags, and return to their "noctes cœnasque," where Ireland might charm them indeed with his flute, but never fail to tell them of his American prophet. And when the prophet's first utterance came ('Nature,' 1836), no doubt Ireland was its first recipient in that region, and passed it round. M. D. Conway.

VICTOR COUSIN AND THE UNITED STATES.

Paris, December 17, 1894.

When the holiday season shall have passed, and other than gift-books can be sold, a notable contribution to biographical literature will be brought out here. I refer to a work entitled 'M. Victor Cousin: sa Vie et sa Correspondance,' in three octavo volumes of some seven hundred pages each. The author of this *magnum opus* is the venerable M. Barthélemy Saint-Hilaire, the translator of Aristotle, the professor of the College of France, the *fidus Achates* of Thiers, the Minister of Foreign Affairs some fifteen years ago, and one of the few remaining life-members of the French Senate. Thus the author, as well as the subject, of this biography, is a personage. But this is not the only reason why these volumes possess more than ordinary value.

Almost at his start in life, M. St.-Hilaire became Cousin's protégé. When the latter was appointed Minister of Public Instruction under Louis Philippe, the young Greek scholar, who held a modest clerkship in the Treasury Department, was made his *chef de cabinet*, and later it was Cousin's influence which had much to do with M. St.-Hilaire's entering the College of France. "I owe a great deal to Cousin," he said on one occasion just a year ago—"even this chair in which I am sitting at this moment, and which was his favorite one." But Cousin willed his friend things more valuable than this handsome old arm-chair. He made him his literary executor, and it was with all Cousin's private papers in hand that M. St.-Hilaire prepared, *con amore*, what must always be the most authoritative and perhaps the definitive Life of Victor Cousin.

In a long Introduction, the author recounts his personal relations with Cousin, which extended over the period between the years 1834 and 1867, the date of the philosopher's death. Then, having devoted some space to Cousin's early life, M. St.-Hilaire divides his career into three periods: 1815 to 1830, 1830 to 1852, and 1852 to 1867, which represent the three phases of Cousin's existence: professor, minister, and historian. Special chapters are given up to Cousin's correspondents and correspondence, to his teachers, his friends, his disciples, and to his personal characteristics. The third volume is filled wholly with the letters which passed between him and Royer-Collard, Hegel, Schelling, Sir William Hamilton, and other distinguished people. A hundred and fifty pages of the second volume are occupied by the history of Cousin's relations with the Congregation of the Index at Rome, an almost unknown episode of his life. The general conclusions concerning the philosophical influence of Cousin take up some fifty pages, while the whole work ends with the index—a desideratum generally lacking in French books—in the third volume.

Such is a brief general description of this forthcoming biography. But I propose examining more in detail some twenty-five pages in the first and second volumes, in which Cousin and several American correspondents exchange their views and hopes about primary education and philosophy, the two chief occupations of Cousin's versatile mind, and in which M. Barthélemy Saint-Hilaire now and then adds his own instructive observations, explanations, and surmises.

It is rather a curious fact in the history of popular education that this all-important matter was a burning topic of public consideration in both France and the United States at the very same hour. It so happened that, during the thirties, Horace Mann, Francis Lieber, Charles Brooks, Thomas Cushing, and many other educational reformers were laboring for the same end in America as were Guizot and Victor Cousin in France, and, what is not the least remarkable feature of this synchronism, they were coadjutors—a relationship revealed in these pages of M. Saint Hilaire.

In taking up the American side of Cousin's efforts in the field of primary instruction, M. St.-Hilaire says:

"In the United States, where M. Cousin necessarily had fewer relations than in Europe, he awakened quite as much sympathy and even more enthusiasm. In general, popular education was very much neglected in that immense country, which, by its very position, had to combat nature and subdue it before being able to think of the cultivation of the mind. . . . If a common organization was impossible, many attempts at particular organization might be profitably made. This was Cousin's opinion, and, in his zeal, he would have liked to do for America what he had already done for France."

What it was that Cousin had accomplished in France, and how he contributed to advance the cause in America, are touched upon in several of the letters in this collection. Thus, on January 17, 1834, Francis Lieber, who seizes the occasion to send his Report on Girard College, which had just been founded, to Cousin, writes to him as follows from Philadelphia:

"Some review articles on your labors have been reprinted here by different societies and distributed throughout the country. I have been asked to translate your 'Report on Public Instruction in Prussia.' As I was born in that country and owe to its institutions, schools, and universities all that I am, I take a double interest in your excellent work; and it has occurred to me that I might submit to you my humble effort as a means of expressing to you the deep thankfulness which ought to be felt towards you by all who have a care for the rising generation even in this hemisphere. This sentiment is all the stronger because the way for it was prepared by the admiration awakened here by your philosophical works. . . . You will oblige me very particularly, and will render, I believe, a service to this grand cause of education, if you will be kind enough to send me all the legislative or other documents relating to the school system, past or present, of France. I desire very much to have the Report of the Minister of Public Instruction. I beg you to pardon me the trouble I give you with so little ceremony. But I feel sure that you will be disposed to furnish all the light you can in so noble a cause, which is, in reality, the cause of humanity."

Alexander H. Everett, editor of the *North American Review*, writing to Cousin from Boston in the spring of the same year as Dr. Lieber, thus refers to the latter's educational publications: "As you are doubtless aware, they have attracted the most serious attention in this country, as well as in England, and they will render an immense service to this grand cause of education."

The Rev. Charles Brooks, who met Cousin in Paris in 1834, writes to him from Hingham, Mass., early in 1837, that, during an extensive tour devoted to lecturing on the necessity of a reform of elementary education in the United States, he often quoted Cousin's Prussian Report, and then continues: "I had much more success than I thought I should have, and I am convinced that it is due to my having followed your example in your noble and wise efforts to obtain the same end. Your name was constantly associated with my labors, and I referred to you as one of the greatest benefactors of the two continents. May God bless you in your future work."

Cousin exchanged several letters with Mr. Brooks, sending him on one occasion the Report on Dutch Schools which the former had just brought out, and which the latter translated and circulated extensively in the United States. "Your work is widely known," Mr. Brooks writes him, "and is exercising the most happy influence. We are profoundly thankful to you for it." Whereupon Cousin replies: "I feel that there exists in America a veritable love for the people and a wish for their moral emancipation, without which all civil liberty is a chimera and a danger. I sympathize from the very depths of my heart with the efforts of all the true friends of popular education, and I beg of them to count upon me on every occasion."

In 1837 the American Institute of Boston chose Cousin as one of its foreign members, and this is M. Barthélemy Saint-Hilaire's comment thereon:

"Though M. Cousin was loaded with honors of this kind, he said that none ever touched him so deeply as this one. We can easily believe him, for such a disinterested recognition as this, coming from such a distance, was the very thing to move a heart like his. M. Cousin had done good service to his own country, and it so happened that what he

had accomplished in France had also been a benefit to far-away nations. A large nature could be excused for feeling a personal pride in having obtained a result which was as happy as it was unexpected."

M. St.-Hilaire publishes in full a long, earnest, and characteristic letter sent to Cousin in 1838 by a once well-known Boston teacher and text-book compiler, Miss Eliza Robbins.* In this rather rambling epistle its author refers to Hillard as "a young man who ardently desires to make himself useful to society," declares that Bryant "is the most admired poet of our country," mentions her "having in Europe a young friend, Mr. Charles Sumner, who has already had the good fortune of seeing you," describes a cheap edition of the Prussian Report which she had brought out, and then dwells on "the immense services you have rendered our age and all countries by the explanations, as beautiful as learned, concerning a method and practice that can secure the moral culture of mankind."

Cousin was also acquainted with another original Boston teacher. He says in one of his letters to Mr. Brooks: "Will you kindly offer to Mr. Alcott, as coming from me, a copy of the list of questions which I drew up for one of my countrymen whom the Government has sent on an educational mission to Denmark, Sweden, Norway, and Iceland? Mr. Alcott might do me the honor to insert it in his journal." This same letter contains the following message for an educator of quite another mould: "If Mr. Edward Everett, whom I formerly knew at Göttingen, still remembers me, give him my compliments, and please tell him that I am at his command if he wants documents or my humble opinion on any matters connected with public instruction."

But Cousin was not satisfied with simply sending our educational reformers his writings and his advice and receiving in return honorary distinctions and flattering praise, however sincere and well deserved. He paid a higher compliment to his transatlantic colaborers by repeatedly asking them for accounts of what they were doing, and what the state of education in America was. It is evident that he felt he, too, could learn something from them. His letters to his New York and Boston correspondents and their replies show this in many places. Thus, he asks Alexander H. Everett to send him a complete collection of documents on education in Massachusetts. He thanks Brooks for a box of books and pamphlets of this kind, "a precious gift"; begs, further, for sets of the *Annals of Education* and the Memoirs of the American Institute, and closes the letter with these words: "I hope these two works will suffice to keep me *au courant* of popular education throughout the American Union. And, finally, I trust that you can get for me each year the official reports of the Massachusetts Government."

Without doubt these American relations reminded Cousin—it is M. St.-Hilaire himself who makes the surmise—of a grave *lacuna* in the famous "law of 1833" which established the primary-school system of France, that is, in so far as boys were concerned. The education of French girls was not even mentioned. M. St.-Hilaire offers this explanation, which is new, to me at least:

"This oversight, however, cannot be attributed to M. Cousin. A mind like his could not have been so narrow. In the proposed bill as he submitted it to M. Guizot was a fifth and final article devoted wholly to girls. . . . In a moment of feebleness, which was far from honorable, the Government cut off this article. What was the motive? It is no longer known; but from what was said at the time, the reason was a most unworthy one. It appears that the Government feared that the Chamber of Deputies might ridicule them if they left this clause in. So, instead of bravely facing down these foolish jokers, the Government timidly drew back."

So it was not Cousin's fault if the elementary education of girls by the state was not realized till towards the end of the Second Empire, I might almost say till the advent of the Third Republic. It is to be noted, also, in this connection, that M. St.-Hilaire makes Cousin the author of the law of 1833, which is always attributed entirely to Guizot.

But it was not alone questions of elementary education which drew Cousin towards America. Philosophical interests also attracted him in the same direction. Several of his metaphysical studies had been translated by Americans and published in the United States before his report on the Prussian schools had appeared even in France. In fact, his reputation as a philosopher had prepared the way in the New World, as we have already seen from Dr. Lieber's letter, for the more utilitarian rôle of the educational reformer. One of these American propagandists of the principles of French philosophical spiritualism was George Ripley, who had brought out in English dress in Boston several fragments of Cousin's work in this field, and to him Cousin writes as follows in 1838:

"The letter which Mr. Sumner handed me gave me great pleasure, as it informed me that Mr. Bancroft is one of us in our philosophical belief. God bless his noble efforts. Materialism and atheism can produce a revolution, but they cannot establish liberty. If you have no faith in the dignity of man and the grandeur of his destiny, you are not likely to devote yourself to his service, or to recognize or respect his rights. Spiritual philosophy has its place wherever Christianity has its place, wherever man is counted as something. I am not sufficiently acquainted with American affairs to have an opinion about the political parties which divide you. But, in the world at large, I may be said to belong to the grand liberal party; and my politics are in accord with my philosophy. In Europe, I cannot call myself a democrat, for I am a constitutionalist; and eclecticism has been my guiding star in the political storms which I have encountered, as among the systems of philosophy which I have examined. Since Mr. Bancroft is kind enough to interest himself in my labors, please give him my compliments, as well as Mr. Brownson and Mr. Alexander H. Everett. Ask them to please send me any numbers of the *Christian Examiner* or the *North American Review* in which philosophical questions are discussed and I can find some signs of progress of the good cause."

Among the other American correspondents of Cousin were Sumner; Henry P. Tappan, introduced by Bancroft in 1851 as "one of the best thinkers of my country," whose 'Elements of Logic,' M. St.-Hilaire tells us, "Cousin declared equal to anything Europe possesses in that department"; Prof. March of Lafayette College; Henry Wheaton, then United States minister to Berlin; Prof. Charles K. True of Wesleyan University, Middletown, Conn.; George Ticknor; President Bache of Girard College; and Henry Harrisse, the Columbus scholar.

THEODORE STANTON.

* The late editor of the *Westminster Review*, Dr. John Chapman, who died last month, used to tell a rather amusing and typical anecdote of Miss Robbins. While she was a guest at his London house, Louis Blanc, then in exile, called. Greatly surprised at the diminutiveness of a man about whom she had heard so much, she exclaimed when he had left: "Well, that's about the smallest atom of eminence I ever laid eyes on."

Correspondence.

THE PULLMAN-CAR RATE.

TO THE EDITOR OF THE NATION:

SIR: While nearly every one will impulsively approve of the pending legislation to regulate and reduce Pullman-car rates, said to be championed by Senator Sherman, there is a view of the matter, apt to be lost sight of, which, when considered, will cause a reversal of the opinion of some on the subject. Senator Sherman and other advocates of a high protective tariff oppose free trade because it will result in cheapness, and cheapness is one form of vulgarity. Consistency is a rare quality, with Senators as well as with other people. Senator Sherman objects to paying two dollars for a night's lodging on a Pullman. He wants the rate cut down to a dollar or less, and a substantial difference made between a lower and an upper berth. But such changes will not affect him alone. There are many more persons who would pay one dollar for a berth than there are persons who now pay two dollars for one. Last summer, when I boarded the train at Colorado Springs, and found that, through some act of stupidity or omission of the agent, no berth had been reserved for me, and all the lowers and all the uppers were taken at two dollars or more apiece, I thought Pullman rates were too low.

I do not pretend to be consistent. I am in favor of free trade, but I am not in favor of free Pullman berths. I can wear a free-trade suit of clothes and be perfectly exclusive about it, and I want to sleep in a Pullman as nearly exclusive as I can. Senator Sherman aims to make Pullmans cheap and vulgar. He overlooks the fact that he now gets something for his $2 besides his night's lodging. It is worth something to have the upper over your lower berth unoccupied. It is worth something to feel that your co-Pullman occupants are of the well-to-do, and usually the more refined, class. Let Pullman alone. Compel all the railroads to haul what may be termed "tourists' sleepers," if you like, Senator Sherman, but spare to such of us as want them the privilege we now enjoy. As a legislator we have the right to expect you to be consistent.

W. J. ROBERTS.

KEOKUK, IA., December 31, 1894.

A CHAPTER OF ALASKA.

TO THE EDITOR OF THE NATION:

SIR: Your correspondent Mr. Bingham, in the *Nation*, 3d inst., very properly calls attention to the fact that the writer of a "Chapter of Alaska," in the *New England Magazine* for January, 1895, has been imposed upon: the character and services of Charles Bryant in no manner whatever resemble those attributed to him by the writer of that article.

Charles Bryant sailed in 1853 for his first cruise in the North Pacific Ocean, in the whaleship *Metacom*, 360 tons, owned by J. B. Wood & Co. of New Bedford, Mass. This vessel sailed from New Bedford on its fifth cruise, in 1853, for the "Pacific Ocean and Northwest Coast"; she returned to New Bedford in 1857. She was commanded by Capt. E. H. Woodbridge, and Bryant does not appear as an officer on her rolls. She sailed again for the same region on July 16, 1857, with Bryant on board as a second mate, commanded by Capt. John F. Hinds; while homeward bound in 1860, she was lost on Tutuilla, Navigator Islands, in

December, but 700 barrels of oil were saved and sold from the wreck. Bryant never sailed again.

Charles Bryant actually knew nothing of Alaska in 1867, more than the average whaler's yarn about the country—a vague and idle understanding. Whalemen never went ashore in that region unless wrecked there. They made Honolulu their base of supplies, and the only natives that Bryant ever saw or understood were the Sandwich Island people.

What he learned and what he did for the natives on the seal islands of Alaska reflects no such light as Mr. C. E. Cabot tries to throw over it. J. A.

WASHINGTON, D. C., January 7, 1895.

TO THE EDITOR OF THE NATION:

SIR: Mr. Bingham's letter in your last issue, under the above caption, is about as wide of the mark in a critical sense as the foolishly laudatory article in the *New England Magazine* was in the other. Capt. Bryant was among those examined when the treaty of annexation was pending, and showed a very good knowledge (for the time) of the Bering Sea region, though I do not think his testimony was in any sense decisive as regards the acceptance of the treaty. Still, it no doubt led to his appointment as assistant agent at the islands, where he did good service for the Government, and stood against a mass of false testimony, abuse, and greed, for the rights of the Government and the natives. To him more than to any one else is due the consideration of the rights of these helpless people in the lease contract. He was in constant correspondence with Senator Sumner, and fortunately was worthy of the confidence of the Senator and the Secretary of the Treasury, which he retained as long as he remained in Alaska.

The magazine writer has confused valuable and useful observations made on the seals after his appointment as agent, with his testimony before the committee on the treaty. The former were published by J. A. Allen in his work on the seals issued by the Museum of Comparative Zoölogy at Cambridge, and were rated as important and valuable by Prof. Allen, who is certainly a good judge in such matters.

While Bryant was not a cultivated man, he was intelligent and experienced, and not at all what one usually understands by the term "illiterate." On the whole, he has deserved well of his country, and certainly deserved a more intelligent and better informed eulogist than the writer in the *New England Magazine*.

H.

WASHINGTON, January 6, 1894.

Notes.

THE Century Co. will publish this week a work on 'Municipal Government in England,' by Albert Shaw.

A series of biographies of "European Statesmen," in the style and scope of "Twelve English Statesmen," is to be issued by Macmillan & Co., under the editorship of Prof. J. B. Bury. The same firm announce a students' edition of Chaucer in one volume, by the Rev. W. W. Skeat.

Ginn & Co. have nearly ready 'The Academy Song-book,' for use in schools and colleges, by Charles H. Levermore, principal of the Adelphi Academy, Brooklyn, and H. F. Reddall.

'Sidney Forrester' is a novel, by a new writer, announced by H. W. Hagemann, 160 Fifth Avenue.

The Harpers have added another volume to the bookish monument of the late George William Curtis, 'Literary and Social Essays.' These are nine in number, ranging from 1853 to 1891, and are mostly of one kind, having to do with the personality and the genius of Emerson, Hawthorne, Longfellow, Holmes, and Irving. There is also one on Rachel, one on Thackeray in America, and a third, on Sir Philip Sidney, which has never been published heretofore. They have in common the stamp of the magazine writer, and belong (except in outward form) with the triple series of selections 'From the Easy Chair.' The publishers have made a pretty book of this, but on p. 133 "Fénélon" should discard its second accented *e*, and on p. 142 Francesca di Rimini has her sex altered by a misplaced final *o*. Into Emerson's "Concord Hymn," even, a misprint of "see" for *set* in the third stanza (p. 11) has crept; and in the last line of the second stanza "that" should be replaced by *which*, if we may trust 'Harper's Cyclopædia of British and American Poetry.'

The fourth volume of Jefferson's writings as edited by Paul Leicester Ford (Putnams) covers the period from 1784 to 1787, during the ministry in France. The future head of the low-tariff party is here seen desirous to have the States "practise neither commerce nor navigation, but to stand with respect to Europe precisely on the footing of China." "The cultivators of the earth," in his theory, "are the most virtuous citizens, and possess most of the *amor patriæ*. Merchants are the least virtuous, and possess the least of the *amor patriæ*." Jefferson's continental instincts, however, forced him to take an interest in "the cutting thro' the isthmus of Panama—which the world has so often wished & supposed practicable." He also pays sufficient regard to Europe to inform Monroe of the ratio of gold and silver in several countries, for the guidance of Congress on that subject. "The average is 1 to 14⅝." On the other hand, he was pleased to see "the exaggerations of our want of faith with which the London papers teem," with consequent loss of credit abroad; which he hopes will lead to the abolition of all credit at home. He has a kind word for Thomas Paine, as worthy of Virginia's substantial gratitude; and he touches off neatly the characters of Franklin and Lafayette.

The Syndicate Publishing Co., Philadelphia, have now completed with a fourth volume their reissue of 'The Encyclopædic Dictionary.' The first variations from the original plates (of 1888) appear in the appendix, which opens with an historical sketch of the English language. Some changes have been made in the list of Latin phrases and quotations and in the brief chapter on English lexicography. Additions are: A not very extensive array of American colloquial and slang phrases; names of States, Territories, and political parties; geographical Americanisms; tables of weights, measures, and money; glossaries of law, trade, and finance, etc. The lists of contractions and abbreviations are omitted. There is a gain in space on the shelf from this edition, but no higher praise can be awarded to it. The original remains an excellent work, valuable for reference beside any other.

'Hazell's Annual' for 1895 (London: Hazell, Watson & Viney) completes the tenth year of this excellent encyclopædia. In the mass of new matter introduced the greatest interest attaches, on both sides of the water, to the revolutionary Finance Act in the particulars of income tax and death duties. These are fully set forth. There are maps of Africa (for its political divisions), Australia, the Arctic regions (showing explorations up to date). Mr. Maxim's air-ship is described under Aërial Navigation. Mr. Aubrey Beardsley's is one of the new biographies. It appears that this master of black and white was a musical precocity, and "gave concerts at the age of 7," *i. e.*, in 1880. Signora Duse, Prince Hohenlohe, Moritz Jokaï, Johann Strauss, Casimir-Perier, and Nicholas II. are likewise noticed for the first time.

The South cuts a large figure in the two bound volumes of *Scribner's Magazine* for 1894. Besides Mr. Cable's "John March, Southerner," and Mr. Thomas Nelson Page's "Burial of the Guns," we meet again articles on the farmer in the South, on Florida, and on the Sea Islands (Mr. Joel Chandler Harris's account of the great hurricane). By contrast, four famous New England watering-places are described for the hundredth time. Vanished hands are recognized in Robert C. Winthrop's brief paper on Webster's reply to Hayne, and in Mr. Hamerton's remarks on the artists selected for representation in the pictorial series, "Types of Contemporary Painting." Three other series are notable for their illustrations as well as for the letterpress, viz.: that giving numerous examples of the work of Sir Joshua Reynolds, and two on Burne-Jones and Watts, in which *Scribner's* does a real service to a tottering art by calling in the skilled wood-engraver where economy would have dictated a resort to "process" engraving.

The tenth volume of the monthly which bears the imprint of the *Babyhood* Publishing Co., New York, justifies anew its title to admission into every family with growing children. Out of 67 leading articles in this volume, 29 are from the pens of physicians, and Dr. Leroy M. Yale's name is still borne on the title-page as medical editor. There is much interesting matter also in the domain of education, and the notes and queries for anxious mothers are noticeably fresh in spite of the recurrence of the old story.

The publication of Mr. G. Steel's 'English Grammar and Analysis for Students and Young Teachers' (Longmans) is, in a small way, an international misfortune. The author describes himself as "Lecturer on Science and Method under the School Board for London." We do not know to what department of science Mr. Steel has given his attention, but the gross blunders which deface his little manual show that he has no knowledge of the science of philology. As to "method," we hope there is more of it in Mr. Steel's school-board lectures than in his book.

A work of exceptional value reaches us in a new edition of Medlicott and Blanford's 'Manual of the Geology of India,' prepared by R. D. Oldham, superintendent of the Geological Survey of India. The original edition, published in 1879, has for some time been out of print. Much revision of its chapters was needed in view of new field-work. That this has been given by Mr. Oldham appears from the special type in the elaborate table of contents by which the new matter is indicated. The three main divisions of India are well characterized—the peninsula upland, a dissected plateau of old rocks and lava-beds, slightly disturbed; the great mountain ranges on the north, of old and young rocks, greatly crushed and deformed and deeply eroded; and the broad Indo-Gangetic plain between the two, a wide expanse of river-borne gravels, sands, and clays.

It is noticeable, in the closing chapter on the geological history of India, that Mr. Oldham retains local names, such as Dharwar, Cuddapah, and Vindhyan, for the older divisions of the stratified rocks, not feeling satisfied to correlate them definitely with the divisions of the geological scale more familiar to us. The volume contains a colored map on a scale of 96 miles to an inch.

Two volumes, styled 'Morphologie der Erdoberfläche,' by Prof. Albrecht Penck of Vienna, constitute the latest number in the series of Geographical Handbooks edited by Prof. Ratzel, and published by Engelhorn of Stuttgart. Prof. Penck is well known as among the most active of the younger school of geological geographers in Europe, if, indeed, he may not be called their leader. Since his call to the University of Vienna, he has been a prolific writer and an inspiring teacher; yet he has found time for the preparation of the scholarly work now before us, even though it has involved the consultation of a great variety of geological and geographical literature. Unlike some other numbers of the series, Penck's work contains a large number of citations of scattered articles, which must prove of high value to the inquiring reader. Its contents embrace the whole earth at one extreme, and its minor topographical features at the other. It must prove indispensable in all our libraries where German scientific books have any place.

The Berlin publisher Hoffmann has just issued a volume of 380 pages entitled 'Bismarck-Gedichte des *Kladderadatsch*,' edited by Horst Kohl, with nearly a hundred illustrations by Wilhelm Scholz and Gustav Brandt. It contains more than two hundred poems, chiefly of a satirical or humorous character, some of which have been already printed in the 'Bismarck-Album' published by the same house in 1890. The book is a unique and decidedly entertaining contribution to the recent political history of Germany as reflected in the magnifying and facetiously distorting mirror of a comic journal. The earlier poems, beginning with 1862, are mostly censorious, and it is curious to follow the evolution of opinion from animadversion and antagonism to expressions of high esteem after the war of 1866, culminating in unbounded admiration from 1870 to 1894.

In this connection we may mention two other Bismarckiana, both edited by Dr. Heinrich von Poschinger: 'Die Ansprachen des Fürsten Bismarck' (Stuttgart: Deutsche Verlags-Anstalt), a collection of speeches made between 1848 and 1894 to deputations and on other occasions of gratulation and ovation; and the second volume of 'Fürst Bismarck und die Parlamentarier' (Breslau: Trewendt). The first volume of this work, which appeared a year ago, bore the subordinate and special title, "Die Tischgespräche des Reichskanzlers," and consisted chiefly of his table talk, whereas the contents of the present one are derived from utterances of various members of the imperial Diet, communicated either orally or through the press, or contained in letters, memoirs, reminiscences, and similar publications. It covers the period from 1847 to 1879, and will be followed by a third volume coming down to the date of Bismarck's retirement from office.

A little-known, but accomplished and wise teacher, M. Lachelier of the École Normale, now *inspecteur général*, has the satisfaction of seeing the fruits of his teaching in a second generation of writers taught by pupils of his own. M. Gabriel Séailles, who is himself one of the most inspiring professors in Paris, has published a book, 'Ernest Renan: Essai de biographie psychologique' (Paris: Perrin & Cie.), which is a conscientious and thorough piece of work. It is an admirable study of the great and elusive thinker and writer whose influence has been and is so largely felt by the youth of France. It is earnest and serious, and withal captivating. It enables one to understand the affectionate enthusiasm felt for M. Séailles by his students, and to trace to its source the excellence of the work done by them.

M. Charles Buet's 'Le Péché' and M. Paul Gaulot's 'Henriette Busseuil' (Paris: Paul Ollendorff) are two of the very latest additions to the large family of French novels whose chief characteristic is a loving treatment of sensuousness and adultery. The work of M. Gaulot has not even the high literary quality which might condone in very slight degree the choice of subject, and merits, therefore, no further mention. M. Buet's is somewhat better written, but is mainly remarkable for the bold assertion of the author, in a prefatory letter to M. Bourget, that, like this gentleman, he is a "catholique," a religiously moral writer, and therefore his book is good, though otherwise it might even be bad, being the account of a "physiological case." It becomes very speedily wearisomely disgusting.

Since we last took note of its progress, the new (eighth) edition of the invaluable 'Ritter's Geographisch-Statistisches Lexikon' (Leipzig: Otto Wigand; New York: Westermann) has advanced from the fifth to the tenth instalment, which brings the work to the letter G. This affords a convenient point of comparison with the bulk of the sixth edition, and shows 640 against 520 pages. More than a quarter of the work has thus been achieved. Nearly the same forwardness has been attained by the 'Dictionnaire Général de la Langue Française' of MM. Hatzfeld, Darmesteter, and Thomas, of which the fourteenth fascicule ends with *four*. Apart from its popular character, this work is playing a useful part as a forerunner of the 'New English Dictionary,' in respect of the ultimate derivation of French words, in the light of the latest scholarship. On the other hand, when Mr. Henry Bradley reaches *fardel*, it will be interesting to see whether he can throw no more light on the origin of *fardeau* than our French editors profess to be able to do.

The fifth part of Mr. Wm. C. Harris's 'Fishes of North America' (New York: The Harris Publishing Co.) embraces the duck-bill catfish and the sturgeon, and the bowfin or dogfish, in the letterpress, while the two chromo-lithographs represent the weakfish or squeteague, and the Rocky Mountain whitefish. We understand that the costly and difficult work of publication will now be carried on at a much more rapid pace. The colored fish-portraits are all from oil originals expressly prepared for this work.

The three latest parts (30, 31, and 32) of the 'Atlas to accompany the Official Records of the Union and Confederate Armies' (Washington: Government Printing Office) continue the general topographical map of the theatre of war. The only Northern States in this portion are Ohio, Indiana, and Illinois.

Mr. H H. Johnston's official report of his three years' administration of British Central Africa is a valuable account of the physical, ethnological, social, and political conditions of a comparatively little known part of the continent. Two-thirds of the country described, the eastern half of the northern basin of the Zambesi, consists of extensive plateaux broken by river valleys and mountain ranges. When above 3,000 feet in height, they have for six months of the year a delightful temperature, and at no season is the heat unbearably oppressive. The value of the country for stock-raising is greatly diminished by the tsetse fly, which, however, disappears with cultivation. The lung-disease which, starting from the country south of Abyssinia, has swept southward to the northern end of Lake Nyasa, destroying not only domestic cattle, but buffaloes, antelopes, and zebras, seems to have died out. Considerable space is given to an account of the origin of and devastation caused by the slave-trade, as well as the measures taken to suppress it. The Commissioner has come to the conclusion that the presence of Arabs is incompatible with the introduction of European civilization, and sooner or later the Arabs must go from Central Africa. Its salvation, he believes, will be found in the introduction of the Indian trader and agriculturist. A number of maps accompany the report.

The presence of the Sikh soldiers in British Central Africa has brought a new language into existence, which is described as a most extraordinary "mixture of Hindustani, Swahili, Yao, and Chinyanja." Though but a year old, it is well understood by the people. The influence of the Indians is shown also in a wonderful change in the habits and manners of the natives. They require boots, turbans, trousers, and coats, and at a distance it is said to be now difficult to distinguish the half-naked savage of a year ago from the Sikh soldier in his ordinary dress. Better than this, the negro is reported to have gained confidence in his British rulers, to have laid aside the gun, and to be devoting himself much more regularly to earning the money required to supply these new wants.

From the thirteenth annual report of the Dante Society at Cambridge (Boston: Ginn & Co.) we learn that a concordance to the lesser Italian works of Dante, similar in plan to Dr. Fay's Concordance to the 'Divine Comedy,' has already been completed in the cards, and that a concordance to the Latin works is contemplated. For these and many other useful undertakings an enlarged membership is much to be desired. The Latham prize is to be reawarded for the best essay by a Harvard student, or graduate of not more than three years' standing, on one of three topics. The report is bound up with a valuable index of proper names in the prose works and canzoniere of Dante, by Paget Toynbee. We remark here a recent publication by Prof. A. Fiammazzo, 'Il codice dantesco della biblioteca di Bergamo [codice Grumelli], illustrato' (Udine: Doretti). In sixty-seven pages this, one of the most precious MSS. of the 'Divine Comedy,' is described, and the variants as compared with Witte's text recorded. The codex dates from 1402.

Mr. Reuben G. Thwaites, secretary of the State Historical Society of Wisconsin, writes to us: "In your issue for December 27, 1894, I find an appreciative note upon the forty-second annual meeting of the State Historical Society of Wisconsin; but you state, in connection with its collection of bound newspaper files, 'About 350 volumes date from before the nineteenth century.' As a matter of fact, the number of volumes of newspapers in this collection ranging between the years 1650 and 1800 inclusive is 720."

In our notice last week of Marston's 'Walton,' we neglected to name the American publishers, Messrs. A. C. Armstrong & Son.

—The *Atlantic* for the month of January contains an article which, even in the midst of others that are excellent, is conspicuous for breadth of treatment and for the writer's energetic sympathy with her subject—the meaning, nominally, of the annual Welsh bardic festival of the Eisteddfod. Under cover, however, of the limitation of the title, there is to be found an able panegyric, not only of the Cymric tongue—declared not unlike the Greek, so rhythmical is it, "so velvety-smooth, then again so full of resonant, *big-mouth* words"—but also of the people to whom it is the dearest of inheritances, a cult, something not only loved but reverenced and adored. The exalted patriotism and poetical gifts of the Cymro of old are traced in his descendants, who have transferred their virtues, their love of Cymraeg, and their Eisteddfodau to a new soil, and whose singing here is still fervency itself, "particularly in the great chorals wherein they excel all other nationalities," although the intensity of their fervor never causes a loss of purity of tone. That "the highest possibilities of alliterative consonance are to be found in the Welsh language" is a dictum no one will be disposed to dispute, or perhaps regret, after glancing over the nomenclature and examples of "restricted versification," with its pencerddol, dysgyblaidd, and iselraddol symphonies, and their subdivisions. Although it has not the racial revelations that make the paper by Edith Brower exhilarating reading, a much briefer article, by Philip H. Goepp, on "The Symphony Illustrated by Beethoven's Fifth in C Minor," is at once a clearly reasoned and persuasive warning against the fallacy of too persistently finding "a meaning" in music. Enthusiastic amateurs will do well, in the interim of listening to music, to read here why they also should not fall into the opposite fallacy of seeking "mere sensuous sound effect." To turn from the number's striking musical group, which is completed by the first part of Mrs. Wiggin's "Village Stradivarius," "The Survival of the American Type" is a forcible, if here and there nebulous, article, to the effect that our development of a new citizenship, grouped about personality that must come to the front, is the only alternative to our loss of liberty. Prof. Adolphe Cohn's review of French recovery since *l'année terrible* is an example of the lucidity of expression that distinguishes the people of whom he writes.

—Although the four magazines have, without exception, devoted space to the most observed of Oriental nations, the *Century* alone balances its somewhat perfunctory article on "The Armor of Old Japan" by another on the rival people. This, which is the continuation of an M. P.'s recollections of Canton, deals with the punishment of criminals, and the river population. In view of its capital illustrations, together with its pleasantly familiar and graphic text, it may be considered the most noteworthy of the number's completed articles, unless future developments shall award this distinction to Hiram S. Maxim's elaborately and excellently illustrated account of his invention of a new flying-machine, under the head of an experiment in aerial navigation. A clever disciple of Mr. Henry James pursues through the intricacies of international variance in intonation, social habits, and views of afternoon tea, the story of "A Lady of New York," and in spite of the film of psychological analysis which he interposes as a veil between reader and characters, succeeds in presenting the latter agreeably and movingly. For the rest, *place aux dames* may be taken as the motto of the number, since a sprightly summing up, in guise of fiction, of the various ways in which an active young woman may nowadays wrest a living from society by means of hands and head, is followed finally by descriptions of festivals at five colleges for women. Though the themes are not novel, the indulgence which is the part of chivalry towards what is produced by the sex will doubtless be extended to the articles.

—The title-page of *Scribner's* gains a distinction it is to keep throughout the year from the name of George Meredith, whose new novel, "The Amazing Marriage," begins in the current number. Miss Edith Wharton adds to the beautiful reproductions of some almost forgotten terracotta groups in the remote monastery of San Vivaldo in Tuscany, the needful description of their rediscovery by herself, and supports her critical acumen as to date and origin by the authority of Prof. Ridolfi, who writes, "I declare with absolute certainty that it is a mistake to attribute these beautiful works to Giovanni Gonnelli, and that they are a century earlier in date," from the hand of "an artist of the school of the Robbias, who follows their precepts and possesses their style." Without the aid of an appeal to the eye, George Trumbull Ladd produces a view of the "Mental Characteristics of the Japanese" which may be accepted as the most enlightening contribution to the month's batch of papers upon "this interesting, this provoking race." Mr. Ladd's three months' stay among them was devoted to an attempt to enter into the controlling forms of their mental life, and these forms fall, in his analysis, into sentimentalism, with its accompanying impulsiveness and artistic instinct; fidelity, blind and undisciplined, but productive, nevertheless, of splendid examples of self-sacrificing heroism; and a fickleness, not to be confounded with frivolity, which is at once the source of the mobility of mind admired by foreigners, as well as of the preference of the latter for seeking and trusting the Chinese rather than the Japanese in mercantile and commercial affairs of every kind. Those to whom mental dissection is distasteful will find no tincture of it in the earnest and straightforward paper in which Mrs. Maud Ballington Booth describes the Salvationists as "slummers," in London and in our own democratically developed but no less direful human lairs: As works of alleviation the results she describes are admirable; but hope of eradication is not to be distinctly found in even the "change of heart" which is the Army's reconstructive basis.

—*Harper's* makes its frontispiece of a likeness of the late Count of Paris, and its leading article of a solid piece of reading, which is enlivened by illustrations, detailing the "Fortunes of the Bourbons." Throughout the number, pictures and text are kept in the customary equilibrium—the profuseness or value of one balancing the brevity or slenderness of the other. Mr. Alfred Parsons's "Fuji-San," the great Sacred Mountain of Japan, is, however, remarkable for its illustrations and for the fact that its author made the famous ascent. It is a veracious account of an interesting trip, minus all glamour of poetry or enthusiasm, reading much like a guide-book description, and seemingly "done to order." But the pictures are charming, full of tenderness and a poetic quality which may perhaps have been eliminated from the text by too vigorous and business-like condensation.

—The third annual meeting of the American Psychological Association was held at Princeton, December 28 and 29, under the presidency of Prof. Wm. James. The programme included many interesting papers. The most remarkable topical discussion was, perhaps, that on Pleasure and Pain and Emotion, to which five papers were devoted on Friday morning, by Messrs. Strong (Chicago), Marshall (New York), Mead (Chicago), Miller (Bryn Mawr), and Mezes (Texas). A lively debate sprang up after these papers, participated in by other well-known men. Prof. James's presidential address Thursday evening, on "The Unity of Consciousness," was a clear statement and illuminating criticism of the current typical doctrines of mental unity or synthesis—the burning question now so much in evidence in the controversy between the "Apperceptionists" and "Associationists." Prof. James divided theories into three classes, instead of two: he finds the traditional association theory now opposed by two others, which he calls respectively "psycho-physical," citing Münsterberg and Baldwin as its advocates in this country, and the "spiritual or soul" theory, of which he finds a modern statement in the writings of Prof. Ladd. The discussion which followed was largely in the hands of those whom Mr. James referred to in his paper. As it happened, Prof. Ladd read a long essay on "The Consciousness of Identity and Double Consciousness" the same afternoon. Other interesting papers were "Minor Studies from the Clark Laboratory," by Prof. Sanford, "A Preliminary Report on Imitation," by Prof. Royce, "The Psychic Development of Young Animals," by Prof. Wesley Mills of Montreal, "Recent Advances in the Chemistry of the Retina," by Mrs. Christine Ladd Franklin, etc. The monotony of science was broken midway by President Patton's pleasant reception at his residence on Thursday evening. At the business meeting of the Association, the matter of affiliation with the Society of American Naturalists was considered, and its decision left in the hands of the Executive Council, together with the place of meeting for next year. A constitution was adopted, under which the following officers were elected: President (for one year), Prof. Cattell; Secretary and Treasurer, Prof. Sanford; Council, Profs. James, Ladd, Cattell, Baldwin, Dewey, and Fullerton.

—At no time, probably, in the history of Darwinism, except in the period immediately following the publication of the 'Origin of Species," has the evolutionary hypothesis given rise to so much discussion among naturalists as at the present. For most of this, science owes its debt mainly to the late Prof. Romanes, to Prof. Weismann, and to the School of Mechanical Reversionists, or Neo-Lamarckians, which first took emphatic stand in this country under the banner of Prof. Cope of Philadelphia. The uproar has been going on for the better part of ten years, during which the "under nurse" of Darwinism, as Prof. Huxley years ago styled himself, has remained silent, and has given scant expression to his own views touching the points in controversy. He has recently broken this silence, and with refreshing clearness stated his position as to true Darwinism and the new evolution which some have tried to put in its place. Responding to the toast of "The Medallists," on the occasion of the anniversary meeting of the Royal Society of London (Nov. 30)—Huxley being the recipient of the Darwin medal—he said:

"If it has pleased the Royal Society to re-

cognize such poor services as I may have rendered in that capacity, I am very glad, because I am as much convinced now as I was thirty-four years ago that the theory propounded by Mr. Darwin—I mean that which he propounded, not that which has been reported to be his by too many ill-instructed, both friends and foes—has never yet been shown to be inconsistent with any positive observations; and if I may use a phrase which I know has been objected to, and which I use in a totally different sense from that in which it was first proposed by its first propounder, I do believe that on all grounds of pure science it 'holds the field' as the only hypothesis at present before us which has a sound scientific foundation."

There is no mistaking the meaning of these words or of his arraignment of the methods of the younger naturalists: "I do not know, I do not think anybody knows, whether the particular views which Darwin held will be fortified by the experience of the ages which come after us. But of this thing I am perfectly certain, that the present state of things has resulted from the feeling of the smaller men who have followed him that they are incompetent to bend the bow of Ulysses, and in consequence many of them are preferring to employ the air-gun of mere speculation." In his concluding remarks to the presentation of the Darwin medal to Mr. Huxley, Lord Kelvin, President of the Royal Society, significantly stated: "We may well be glad that the advocate of the 'Origin of Species by Natural Selection,' who once bore down its foes, is still among us, ready, if needs be, to 'save it from its friends.'"

—Among the belated transatlantic illustrated books of the holiday season, the first place may be given, on account of the reputation of the artist, to the 'Faerie Queene,' with illustrations by Walter Crane, issued in numbers by George Allen, London (New York: Macmillan). Number 1 contains the first four cantos of the first book, and is ornamented with four full-page drawings and ten head and tail-pieces, and about this proportion is intended to hold throughout. The designs are not of Mr. Crane's best. His mannerisms seem to grow upon him and his grace to decrease. He is always best in pure outline, and these drawings are overloaded with small fussy touches, and are consequently too gray and weak in effect. Some of his ornament seems slovenly and perfunctory, but the ornamental borders are what is best in the work. Very different are the cleverly realistic sketches, one hundred in number, with which Mr. Charles E. Brock has illuminated the pages of our old friend 'Gulliver' (Macmillan). In the first two parts especially, the sense of scale is admirably given by the artist. The text is printed with the old spelling and capitalization, but has been, though it is nowhere so stated, discreetly expurgated for the use of juvenile readers. Mr. Laurence Housman's illustrations to Jane Barlow's 'End of Elfintown,' also published by Macmillan, show a quaint fancy and considerable skill in draughtsmanship, but are often very confused and crowded in composition. The decorative title-page is very clever and the best thing in the book. Lastly we will note the amateurish but pretty drawings by Emily J. Harding for Alma Strettell's 'Lullabies of Many Lands' (London: George Allen; New York: Macmillan).

MORE FICTION.

The Honorable Peter Stirling, and What People Thought of Him. By Paul Leicester Ford. Henry Holt & Co.

Elder Conklin, and Other Stories. By Frank Harris. Macmillan & Co.

The Story of Rodman Heath; or, Mugwumps. By One of Them. Boston: Arena Publishing Co.

Cœur d'Alene. By Mary Hallock Foote. Houghton, Mifflin & Co.

David Pannell. By Mrs. Alfred Marks (Mary A. M. Hoppus). London: Hutchinson & Co.

Round the Red Lamp. By A. Conan Doyle. D. Appleton & Co.

The Lilac Sun-Bonnet. By S. R. Crockett. D. Appleton & Co.

NONE of the anomalies and mysteries of republican government is quite so hideous and inexplicable to the inquiring child of a monarchy as the proud position of the political boss. The Constitution does not recognize him, the laws make no provision for him (any humble citizen may be more easily put in jail); nobody admits that he needs him and few say that they admire him, yet he continues to flourish, apparently self-elected and self-propagating. Vainly has the press striven to explain, to exterminate, or to justify—the fundamental puzzle of his existence remains unsolved. It is surprising that the novelists (who know everything) have so long ignored him, and gratifying that at last one has shouldered responsibility and vindicated the omniscience of his class by throwing floods of light on the *raison d'être*, origin, and methods of the dark figure that directs the destinies of our cities.

The Honorable Peter Stirling is not a typical boss. Judged by the knowledge of the genus derived from its works, his character is far more ideal than real, but it is so strongly imagined and logically drawn that it satisfies the demand for the appearance of truth in art. This pleasant illusion owes much to selection of telling scenes and incidents and to descriptions of political organization, all of which are literal transcripts of life and fact—not dry irrelevancies, thrown in by way of imparting information, but lively detail, needful for a clear understanding of Stirling's progress from the humble chairmanship of a primary to the dictator's throne. The inference from his character and career is not that a boss is a vital necessity, but that he is more than an accident in a great democracy, and that, given a few Stirlings to compete against many Maguires, the name boss and the thing might lose an opprobrious significance.

In the use of dramatic possibilities Mr. Ford is discreet and natural, and, without giving Stirling a heroic pose, manages to win for him very hearty sympathy and belief. Stirling's private and domestic story is well knit with that of his public adventures. Some chapters of his social experiences and love-making could be spared. They are not needed to complete his presentation, and add nothing to the fiction entirely devoted to such topics. The moral of his love affairs seems to be that man adores only his ideal, and that if he manage to marry the daughter of his first love, he may be reasonably safe from danger of falling in love with her granddaughter.

Style, except in rare instances of genius, is probably one of many expressions of long-transmitted familiarity with grace and beauty and restful dignity, and we regret that an American novel showing intellectual force and considerable technical skill should also indicate our slowness of movement towards things that make life lovely; should, indeed, suggest that we are still somewhat imperfect in our grammar, and believe in such a dreadful word as "escortage." Mr. Ford is pleasingly shy of the adjective and quite above fine writing, but he is addicted to, at times abandoned to, the staccato note. This is a genuine American note, and must be infinitely softened before such a very good novel as 'The Honorable Peter Stirling' can also take rank as good literature.

In Mr. Harris's volume of short stories entitled 'Elder Conklin,' the sketch "Gulmore the Boss" is a very probable representation of the mischievous creature with the results of whose machinations we are painfully familiar. Still, he might have been drawn from hearsay or newspaper reports; there is no evidence that he was confronted in his den and studied from the life. The ingenuousness of Prof. Roberts, who undertakes to rout Gulmore and his gang, is surprising, but not unprecedented, and the characteristic means employed by Gulmore to teach the professor a lesson in practical politics, incidentally including points on human nature, suggest many actual parallels. Undoubtedly bad bosses could never be got rid of if the task were wholly relegated to gentlemen armed only with a knowledge of the classics and with good intentions.

The rest of Mr. Harris's stories conjure up horrid images of society in the State of Kansas. It is as if all the desperadoes of the West had been gathered together for a dance from which only one escaped to tell the tale. We fear that Mr. Harris lent too credulous an ear, sadly misunderstood the humor of that sole survivor of a Kansas holiday, and very grossly mistook his crude attempt to convey an impression of the unconventional fascinations of the prairie maiden. Mr. Harris has added to the probably natural rudeness and vulgarity of an Ida Gulmore or Loo Conklin an unblushing sensuality which no competent critic, however hostile, has ever before attributed to otherwise similar characters. Mrs. Hooper, in "A Modern Idyll," is even more objectionable, and, in view of the conditions assumed, more absurd. So repulsive a pair as she and her lover, the Rev. John Letgood, rarely appear in print. The excuse which narrators of such modern idyls make to themselves is very well known, and it is always based on the conviction that they have perfectly performed an imperative duty to render in fiction the basest facts of life and the most revolting possibilities of character. Mr. Harris's strenuous effort to fulfil this duty fails ludicrously, and that is the reason why his story is not so bad as it might be.

The political independents whose collective name, "Mugwumps," has been given to an anonymous novel, may pray to be saved from their friends. The Mugwump who writes 'The Story of Rodman Heath' has tried to spice a dish of political instruction with extravagantly romantic incident, and made a really dreadful mess of it. "Mugwumps," says Mr. Harris's Boss Gulmore, "is them that thinks themselves too hifalutin to work with either party, jest as if organization was no good, an' a mob was as strong as an army." Mugwumps, seems to say our anonymous author, are Democrats or Republicans long and unconsciously compelled to dwell in darkness by the depression of a minute portion of the skull, delivered and led into light by the surgeon's trephine. Votes may be won in future not by coarsely tendering a five-dollar note, or by the slow process of rational argument, but by persuading a man that his skull should be lifted and hustling him off to a surgeon. If such a generalization

from the special case of Rodman Heath be practicable, surgeons at least will have no reason to complain of revolutionary tactics. The author has much to learn about vigorous expression of honest political opinions, and everything about the construction of a readable story.

The strength of Mrs. Foote's arraignment of labor unions, in 'Cœur d'Alene' is marred by its bitterness. A few bad men may be responsible for strikes that lead to riot and murder, but that is too small a nutshell to accommodate the whole labor question. When protective unions become offensive, the bold, bad spirits are supported by the timid and hopeless, and any presentation even of a single instance of union aggression that ignores the factor of carefully nourished discontent, appears to be partisan and unfair. The novelist who cannot handle such a subject very candidly and broadly had perhaps better let it alone. Mrs. Foote has, however, given the under dog, the "scab," the full benefit of ardent sympathy with his wrongs and of dramatic features in outrages inflicted on him. The serious labor troubles at the Cœur d'Alene mines lose actual and literary value by subordination to a tiresome love story, and the horror of the Mission massacre of "scabs" is belittled by the intrusion of Miss Bingham's fussing over her unheroic lover. Mrs. Foote has generally a very pretty notion of a lover; but in this instance she appears to have forgotten that, while daring in love, Lochinvar must also be dauntless in war.

A few years ago every one who wrote at all had a go at psychic analysis. Whether the public declined to endure so much dulness, or whether authors found its perpetration too tedious, we know not; at all events, specimens now appear only at rare intervals. It is to be hoped that they may henceforth be restricted to novelists whose ability for revealing the secrets of the soul is equal to that of Mrs. Marks. David Pannell, whose conscience she turns inside out, is a subtle and slippery person. To do him justice, showing the right kind and degree of mercy is an enterprise calling for very great confidence in the keenness and delicacy of one's intuitions. The theft of the Giant's Robe is a favorite incident in fiction, and has been used with good effect, but always more coarsely than by Mrs. Marks. Every one interested, except the blunt Briton, George Travers, is horribly confused about whether Pannell really meant to take the credit of his dead friend's work or not; and Pannell, having declined to accept all the profit to be derived from imputed genius, believes himself a perfectly upright and much injured man. The judgment of the reader is, however, clear and prompt, and it is formed unconsciously under the guidance of the author's fine morality. With an artistic avoidance of deliberate moral intention, she manages to make one ashamed to own that he could temporize with truth or hide dishonorable intention by accumulated evidence of actual honesty. Mrs. Marks digresses enough from the study of Pannell to give movement and diversity of character, yet properly concentrates interest on the elastic, accommodating conscience. The action is rather awkwardly broken by the late introduction of Dorrington, an indispensable figure indeed, but dead before the story begins. This slight defect in construction is the only noticeable fault in a very clever book, of which the style is as smooth and pleasant as the thought is straight and comprehensive.

Before reading Mr. Doyle's 'Round the Red Lamp,' the wonder is, "Why so much apology?" and afterwards, "Why not more?" For the presence of several disgusting leaves from a doctor's note-books in a volume of tales no apology suffices. It appears from the preface that some kindly friend had been trying to dissuade Mr. Doyle from publishing "stories which attempt to treat some features of medical life with a certain amount of realism," and that Mr. Doyle yielded to his intercession so far as to reserve a "few stories in this little collection" from serial publication. Having appeased the friend, Mr. Doyle goes on gallantly to throw responsibility for his bare, inartistic statement of loathsome facts on the admiring public that wishes to buy his latest book, saying that the reader can see that the stories are medical and can skip them. Why the reader should not be able to see that in a magazine as well as in a book, he does not explain. The mind, conscious of wrong, sometimes betrays its possessor into folly. Nothing could be more childish than Mr. Doyle's defence. "It is the province of fiction," he says pompously, "to treat painful things as well as cheerful ones." Who ever suspected it wasn't? Who ever said that fiction should be consecrated to the clown and the merry jester?

> "Twist ye, twine ye, even so
> Mingle human joy and woe."

Fiction, Mr. Doyle may be surprised to learn, is almost as old as human life, which has ever been its model and source of inspiration. But fiction is an art, and it is the privilege of the artist's public (if he be wanting in discrimination and taste) to limit his selection of material and to let him know when he has made a mistake. By substituting loathsome for Mr. Doyle's "painful" (which seems to give his remarks more vigor), we specify one of the things which it is the province of fiction either not to treat at all or to treat with such imaginative force that the only mental image excited shall not be ghastly or the only emotion unmitigated repulsion. The greater number of the "facts and fancies of medical life" show so little imagination that it is best to think of all as facts and save Mr. Doyle's reputation as a writer of fiction. Many of the facts are of a kind hitherto enshrined in medical books and not easily accessible to the public. Thousands of people have lived long, useful, and happy lives in total ignorance of such facts, and the triumph of Mr. Doyle and like-minded writers will not be to extend the length and the usefulness of thousands more, but very seriously to impair the happiness. The stories in the volume that are really stories are insignificant, excepting "A Straggler of '15," who is much to be condoled with for having straggled into such objectionable company.

'The Lilac Sunbonnet' is far too long. Joys and afflictions attending love's young dream pall with repetition that lacks variety. The plot draws heavily on stock characters and incidents, including an aristocratic villain pursuing the heroine, a wicked maid-servant intriguing against her, a long-armed idiot providentially succoring her in distress, and one of those curious complications involving one's father and mother in obscurity, impenetrable by the child, which appear to have an undying charm for novelists. Fragments of the love story are sweet and poetical, but the author is at his best only in the concluding chapters, when Gilbert Peden and Allan Welsh solemnly depose each other from the ministry, thus depriving the Marrow kirk of its only surviving leaders, and John Bairdieson runs out from the vestry crying, "There's nae kirk o' God in puir Scotland ony mair!" In this scene comedy treads close on tragedy, and the balance of sentiment is very delicately adjusted.

A SPANISH-AMERICAN ANTHOLOGY.—II.

Antología de Poetas Hispano-Americanos. Publicada por la Real Academia Española. Tomo I., México y América Central; Tomo II., Cuba, Santo Domingo, Puerto Rico, Venezuela; Tomo III., Colombia, Ecuador, Perú, Bolivia. Madrid. 1893–'94.

THE sixteenth century was for Spanish America a period not merely of conquest and of colonial extension, but also of civil organization and of educational and literary inceptions. Incited by the writers and scholars who came in such numbers from the mother country, the new generations of native-born Americans speedily began to express themselves in literature. Their first efforts were greeted with applause by the best wits of Spain. The reader of Lope de Vega and Cervantes will remember, in the 'Laurel de Apolo' of the former, and in the 'Canto de Calíope' and the 'Viaje del Parnaso' of the latter, warm praise of more than one poet and even poetess of the "antarctic region," as it was the fashion to call it. Unfortunately, little is left us of the work of these geniuses; and what has come down to us of the native American poetry of the time does not often strike us as either very original or very beautiful. Unfortunately, also, the very rapidity with which the literary movements of Old Spain were felt in the New, began soon to be a certain disadvantage to the latter. As is well known, the great literary period of Spain in the end of the sixteenth and beginning of the seventeenth century was followed close by the corruption of taste called Culteranism, or Gongorism. The seventeenth and eighteenth centuries were, as a consequence, no less remarkable for literary than for political deterioration in the Peninsula. In Spanish America this condition of things is only too faithfully reflected, and the growing abundance of verses means in the main but greater weariness for the reader.

Even these years, however, are not totally devoid of names of interest. Perhaps the most interesting of all is that of a woman, the Mexican nun Sor Juana Inés de la Cruz. In her we have a great writer, one of the greatest of her sex in Spanish letters. Lest this seem exaggerated praise, we shall venture to dwell for a moment on her and her work. Born in 1651, Sor Juana passed her youth amidst the splendors of the viceregal court of Mexico. Of remarkable beauty and great charm, she was flattered, loved, and sought by all. But, vehement by nature and passionately eager to satisfy the imperious needs of her nature, she was not content with the life of mere society, but, in spite of many obstacles, plunged into all the science and learning of her time. Like certain Italian women of the Renaissance, Cassandra Fedele or Vittoria Colonna, she liked best to consort with scholars; and already at the age of seventeen she had undergone a public examination before forty professors of all the faculties, filling them with amazement at her attainments. But she was not merely a student, she was also a woman—a woman, however, with the independent and wilful personality we first find in the Renaissance. As a woman she loved, and passionately; but, as a perfected individuality, she did not keep her love for him who should first seek her. She bestowed it where she

would, and, like many another of her type, on one who could give her no return. Hence trouble, despair, passionate regrets, and in the end retreat to the cloister. Sor Juana would not, simply because she suffered, stand apart from a large group of her sex; but she does stand apart, or at least among the few, in that she was able with power and truth and entire dignity to put this all down in her verse. Much that she wrote is disfigured by the tortured and emphatic mannerisms of her time; but much also conveys the emotions, the experiences, and the reflections of her overfull life with such directness and precision as it is not given many even of the excellent poets to attain.

In spite of Sor Juana and a few other poets whose Castilian or Latin verse rises above mediocrity, we are justified in passing over with little attention the literary history of Spanish America in the seventeenth and eighteenth centuries. It was a time when, as Señor Menéndez y Pelayo wittily remarks, everything was taught in the universities except good taste. As the eighteenth century advances, however, we begin to see there, just as in contemporary Europe, the signs of a coming change. Numerous traces are to be found of an early influence on the one hand of the Encyclopædists, and on the other of Rousseau. More important still was a remarkable revival of interest in the physical sciences. This shows itself particularly in Venezuela, Colombia, and Ecuador. The starting-point of this revival seems to have been the scientific expedition of José Celestino Mutis in 1760—that Gaditanian botanist whom Linnæus called "nomen immortale quod nulla ætas unquam delebit." In 1762 Mutis established a chair of mathematics and astronomy, as well as an observatory, in Bogotá; and there he trained a whole generation of men whose names are honorable in the history of science. Among these were Zea (later director of the Botanic Gardens of Madrid), Duquesne, Restrepo, Ulloa, and, most important of all, Francisco José de Caldas, whose labors as botanist, geologist, physicist, and astronomer show real genius. The influence of this school was wide and very salutary; and the esteem in which it was held was much increased by a later event that profoundly affected the intellectual ideals of the Spanish Americans—namely, the famous scientific expedition undertaken in 1799–1804 by Humboldt and Bonpland. The world at large knows of this expedition chiefly through the stimulus to science given by the publication of the results of it; but the student of South American culture is even more impressed by the effect of association with these men upon the noblest spirits of the southern half of the New World.

The result of these tendencies was a growing independence and maturity of intelligence among the Spanish Americans. This made them all the readier to feel the wave of political agitation that swept over the civilized world as a result first of the American and then of the French Revolution. It was no accident that this agitation first led to action in the northwestern corner of South America, and that the greatest of all the leaders in the Spanish-American War of Independence, Simón Bolívar, was a Venezuelan. On the same side and at first from the same region were almost all the new scientists, scholars, and poets. For real scholars and poets, besides scientists, there now began to be once more in Spanish America; nor, in spite of the wars, revolutions, and civil discords that too much disfigure the history of our century, has the line of them been broken down to the present day.

The first group of these new writers, as was to be expected, gave expression to the revolutionary passion that preceded and led up to the independence of the Spanish-American States. To it belong several important names; but the greatest of all, and indeed one of the three or four greatest in South American letters, is that of the Ecuadorian Olmedo, to whom his compatriots have not hesitated to give the title of the "American Pindar." Here there is perhaps something of *l'emphase espagnole*, as the French call it; yet it cannot be denied that in Olmedo's famous ode to Bolívar ("*La Victoria de Junín*") there is a magnificence of rhetoric, idealizing and exalting a great national event, such as only a small band of poets (and Pindar among them) have been able to command. Far inferior, however, are the too often truculent verses of another member of the group, the Colombian doctor José Fernández Madrid.

The early nineteenth century was for the Spanish Americans not only a time of political passion and effort, but also a period of renewed susceptibility to European thought and art. Accordingly we speedily find representatives of all the chief tendencies that appear in the poetry of the Old World. Romanticism in its various forms creeps in—now sceptical and Byronic, now sentimental, now religious. Of the first of these attitudes the best exponent is the Guatemalan José de Batres y Montúfar—one of the most skilful masters in Castilian of that scornful style employed by Byron when, as Arnold said, he "waged against the conservation of the old impossible world so fiery battle." Only in Batres there is more of the delicate artist than of the passionate, suffering man. Melancholy sentiment, on the other hand, with some admixture of Byronic egotism, found utterance in the verse of the Cuban José María Heredia, a profounder poet, if less perfect workman, than his namesake and kinsman, the recently elected French academician. We might well be proud if we had in our own literature anything approaching Heredia's "Ode to Niagara," a fruit of his brief residence in the United States. Nor, speaking of him, can we pass in silence the name of another Cuban, this time a woman and Heredia's friend—Doña Gertrudis Gómez de Avellaneda. Although the greater part of her productive life was spent in Spain, Cuba has still reason to be proud of being the home of a poetess whom D. Juan Valera has called the "chief of all the persons of her sex who have touched the Castilian lyre, whether in this or in past centuries."

Such are the chief representatives in Spanish America of those tendencies we chiefly think of as Romantic. Of that other tendency, really just as Romantic, to renew and reaffirm religious faith—the tendency which in Europe gave rise later to Neo-Catholicism, so called—we find also abundant expression in South American letters. Here, as we should expect, we find the influence of Chateaubriand and Lamartine to have been great, though there is much also that is essentially Spanish, and much that is peculiar to individual poets. Among these the foremost are the Mexicans Pesado and Carpio, and the Colombians Eusebio Caro and Julio Arboleda. The two last, especially, patriots and soldiers as well as poets, show us reactionary Romanticism in action, ready to accept exile and even death.

There remains one name still to mention, and that indubitably the greatest in the history of Spanish-American literature, Andrés Bello. We have reserved it to the last, because in him is to be seen the ripe fruit of all these influences and tendencies, besides much that is original and peculiar to himself. Born in 1781 at Carácas, Bello studied in the university of his native city and then devoted himself to teaching, having among his pupils Bolívar. When Humboldt arrived in Venezuela, Bello was one of the first to become intimate with him, and accompanied him on several of his expeditions. A little latter we find him in governmental employment, but on the outbreak of the War of Independence he ranged himself among the patriots, by the side of his own former pupil. Not long after, Bolívar intrusted him with the delicate task of representing the insurgents in England and of raising money for them there. So began a long exile, extending from 1810 to 1829, during which he suffered many hardships, but also, on the other hand, came into intimate association with men like Lord Holland, James Mill, and Blanco White. In 1829 Chile offered him a post of influence, which he accepted; and the rest of his life is inseparably connected with that republic. He became for it what Villani says Brunetto Latini was for Florence, "cominciatore e maestro in digrossare i Fiorentini, e fargli scorti in bene parlare, e in sapere guidare e reggere la nostra republica secondo la politica." His labors to this end are almost incredible for their variety and excellence. Every portion of the life of Chile felt his inspiring influence. It was he who founded the University of Santiago and was its first rector. It was he who prepared the draft of the great civil code, which was enacted into law in 1855. As a teacher, he worked for the intellectual and literary improvement of the country—preparing treatises on the grammar of Castilian (the best hitherto made), on rhetoric, on literary history, on philology, on philosophy. As a statesman, he endeavored to increase the knowledge and respect of the Chileans for law; and so deeply did he go into questions of international law that he became an authority of world-wide repute. And yet, in spite of these enormous labors, he was also, perhaps mainly, a poet—recognized even by the critics of the Peninsula as one of the greatest modern masters of Castilian and one of the most excellent poets in that tongue. Deeply versed in the classics, acquainted with every period of Spanish poetry, widely read in the literatures of all Europe, a participator in the heroic struggle of his native land, looking hopefully yet anxiously forward to the future of that land, he united in his poetical work remarkable perfection of style and form, great wisdom, and profound patriotic emotion. It is not to be wondered at that he should be looked up to with reverence by all Spanish America, that statues should be erected to him, that an extensive literature should have begun to form itself about him. On the whole, it is safe to say that he is the greatest man of letters that has yet been born on American soil.

We cannot discuss the literary movements or the names that have appeared in Spanish America since the great Romantic and revolutionary generation passed off the scene. There is much of great interest here, as the readers of Señor Menéndez y Pelayo's pages will see. We can only hope that there will be many such readers in this country. The subject deserves it, and the treatment is worthy of the subject.

INDIAN PICTURE-WRITING.

Picture-Writing of the American Indians. By Garrick Mallery. [Extract from the Tenth Annual Report of the Bureau of

Ethnology.] 8vo, pp. 822, with 54 plates, some of them in colors, and 1,290 illustrations in the text. Washington. 1894.

WHETHER we regard this volume as illustrative merely of a certain phase of artistic development, or whether we look upon it as a record in pictographic language of ideas and scenes in Indian life, it will be found to be worthy of the place it holds among the publications of the Bureau of Ethnology; and this, we may remark in passing, is no small praise. Roughly speaking, the volume may be divided into petroglyphs, or inscriptions carved or painted, or carved *and* painted, upon rocks that are either in place or are of such a size as to justify the inference that they are in the same position they were in when the pictures were made; and second, pictographs, or pictures made upon the human body by tattooing, scarification, etc.; upon natural objects other than the human body, as, *e. g.*, stone, bone, wood, skins, shells, copper, etc., etc.; and finally upon artificial objects like pottery, cloth, and other fictile and textile fabrics.

Of the first of these general divisions, or carvings upon rocks, it may be said that they are scattered throughout the length and breadth of the land, and are to be found wherever there was a suitable outcrop of rock and the surroundings were such as to attract and delay the Indian. They may be mere *graffiti*—the product of an idle hour—or they may refer to a myth or religious practice, or to some incident connected with the daily life of the author; and while they may and probably do show the stage of progress he had reached along this particular line, as they certainly do indicate the subject in which he was, for the time being, interested, yet (pp. 27, 774) they have not been found to be possessed of any great amount of historic value. Even when intended to commemorate events, they usually refer to some insignificant affair, interesting from a local or personal point of view, but of no use as history. The hope (pp. 35, 772), once entertained, that they would tell us of extinct or emigrated peoples, and thus, perhaps, furnish a foundation for the theory about a "mythical tribe of mound-builders," might as well be abandoned, for (p. 771) "rock characters, studied independently, will not give much primary information about customs and concepts," though they may and do "corroborate what has been obtained by other modes of investigation." In other words, we must know all about the people who made the petroglyphs in order to understand their work; and this can seldom be done.

Not so, however, in regard to ordinary pictographs, or pictures made upon bark, skins, etc., etc., by our American Indians. Like gesture-language, this method of recording facts and even (p. 584) abstract ideas is still in use, and instances are more or less common (p. 28) in which it has furnished "information and verification as to points of tribal history, religion, customs, and other ethnographic details." Unlike the rock carvings, the more recent among these records are said to be relatively of easy interpretation, though there are occasions—and unfortunately they are somewhat numerous—when the picture is used as a symbol or reminder (p. 232, etc.), and is, of course, unintelligible to any one not familiar with the story. The fact, too, that in limited areas (p. 772) "diverse significance is attached to the same figure, and differing figures are made to express the same concept," may add to the difficulty of the situation. In all such cases, it is the part of wisdom not to trust too much to our knowledge of Indian life and character, necessary as this is admitted (p. 771) to be to an understanding of their drawings; neither should we put implicit faith in any theory of interpretation, but we ought to summon the adepts in this manner of writing from among the members of the tribe, and look to them for an explanation of the record.

Of the advantage, or rather of the necessity, of this mode of procedure examples may be found (pp. 266, 287, 568, etc., etc.) in the winter counts of the Dakotas; and aside from this circumstance we call attention to these particular records not on account of the skill with which the figures are drawn, nor because of the value of the facts, but for the reason that, so far as we know, they are the first and (except, perhaps, the Walam Olum of the Delawares) the only attempt ever made by any of our Indians at formulating a chronological table. Moreover, with due deference to our author, there are grounds for believing that the idea upon which this calendar was based was borrowed from the whites. Bearing upon this point is the fact that, in characterizing the passing year by some event of local or tribal importance—as, for example, the year "when many died of the smallpox," or "when the stars fell"—and not by its date in the Christian or some other era, the Dakotas were but following the method that was in use ('Missouri,' in "American Commonwealths" series, pp. 51, 55, 56) among the early French settlers of St. Louis. Of itself this coincidence tells us nothing; but if we add that, so far from being common to our Indians a calendar constructed in this fashion was peculiar (pp. 267, 268) to the Dakotas, and, furthermore, that it was not employed by them until towards the close of the last century—at or about the time that the traders from St. Louis began to frequent the tribe—it will be seen that a plausible case can be made out in favor of our contention. However, be this as it may, it is not a point upon which we care to insist, for even if it be admitted that the Indians borrowed the idea, it will not detract from the importance of the records considered as art or history. In either event, the choice of facts and the method of recording them are unmistakably Indian.

In addition to the winter counts, of which nine are known to be in existence, there are hundreds of other records in which the possibilities of this manner of writing, used as a means of intercommunication, may be studied to advantage. Without stopping to particularize, it may be said that in some one of them almost every thought and action common to the Indian is here represented. Religious ideas and practices, individual and tribal designations, manners and customs, historic events, etc., are all portrayed with more or less aptness and precision, and in a way that shows how near akin, in its results, this manner of writing is to our own. Of the immense labor expended in the preparation of this volume, of the value of the facts collected and their bearing upon the problem of Indian civilization, we have not the space to speak. Suffice it to say that among the whole 800 pages of the volume there are but few that are not replete with information and will not repay a careful study.

In this connection it may not be out of place to express the regret which all ethnologists must feel at the death of Colonel Mallery a few weeks ago. It is to be hoped that his mantle will fall upon a worthy disciple, and that the work which he left unfinished will be taken up and carried to a successful conclusion. Especially is this true of the pictographic account given by Red Horse of the battle in which Custer and most of his men were killed. It is here translated into simple English, but we are promised (p. 563) the story told in gesture language; and it is to this that we now look forward as the last work of one who deserved well of all who are interested in ethnology.

History of the United States Navy from 1775 *to* 1893. By Edgar Stanton Maclay, A.M. Vol. II. D. Appleton & Co. 1894.

THE second volume of this History of the Navy, beginning with the closing year of the second war with Great Britain, is brought down to the present time. The general fault which we found with the initial volume, namely, its want of proportion and perspective, is still further emphasized in the conclusion of the work; for whereas the first volume relates the history of the navy from 1775 to 1814, the second embraces not only an important part of the war of 1812, and the Mexican war, but the civil war, during which the navy attained a size and its operations a magnitude without example in its past. Only a little more than one-fourth of the entire work is allotted to this period, so that Mr. Maclay's text is in many places reduced to a mere chronicle, or at best to a bald narrative. Even here symmetry and proportion are lost, and much space is given to minor operations, like the sounding and buoying of channels in the earlier days of the war, or the breakfast offered by Jowett after the battle of Mobile Bay, while comparatively little space is allowed to the long-continued combined operations before Charleston—operations which have attracted the attention of students of naval and military history in all civilized countries, and which called forth one of the most noteworthy defences against maritime siege which the world has ever seen. A show of accuracy is made in the second volume by printing in full the names of a number of persons mentioned; but a closer examination reveals a great many omissions and errors—commanding officers unrecorded whose vessels are mentioned, and not a few names set down incorrectly. There was, for instance, no "Rear-Admiral" P. G. Watmough in the Navy, and such prominent names in our latter-day naval history as James Russel Soley and Capt A. T. Mahan are inexcusably disfigured.

The closing year of the war of 1812 found nearly a hundred British line-of-battle ships and frigates on the coast of the United States, and as a consequence operations at sea on our part were very limited in extent, since our cruisers could only with great difficulty evade the blockade, and even privateers found it almost impossible to send in their prizes and secure the reward without which privateering languished. The three important events with which this war with Great Britain terminated were Macdonough's victory on Lake Champlain, the capture by Stewart, in the *Constitution*, of the *Cyane* and the *Levant*, and the loss of the *President* while attempting to escape through the British blockade off the port of New York. By far the most important and creditable of these events was the victory on Lake Champlain off Plattsburg, partly by reason of the brilliancy of the success of this hard-fought action and the great skill, courage, and endurance shown by Macdonough and his subordinates, to whom the greatest praise should be given; and partly for the results, which may be summed up as the abandonment of the projected invasion along the line of the almost uninterrupted waterway reaching from Montreal to New York city, the loss of the command of Lake Champlain, and

the prevention of the isolation of the New England States from the rest of the Union.

After the war with Great Britain was over, came the operations in the Mediterranean against Algiers, and in the West Indies for the suppression of piracy. Mr. Maclay has a chapter also upon the attack upon the Malaysian town of Qualla Battoo, an almost forgotten episode in the history of our navy. The part taken by the navy in the conquest of California during the Mexican war is fully exhibited, as well as the less eventful and important operations in the Gulf of Mexico and on the Pacific coast of Mexico. Following this comes a narrative of Perry's expedition to Japan, and then we arrive at the outbreak of the civil war.

The introductory chapter discusses the events immediately preceding and at the beginning of hostilities. Several errors are to be noted here in regard to the naval force: for instance, the wooden vessels known as the "ninety-day gunboats," although carrying a heavy battery for their tonnage, were not iron-plated. Extravagant is the statement that at the close of the war the United States held the position of the most powerful maritime nation in the world. Although the navy was vastly increased in vessels and in personnel, many of the vessels were unfitted for deep-sea work and for contending with vessels of other navies. Neither the tonnage of our mercantile marine, greatly reduced for want of adequate naval protection, nor the fighting strength of our navy, justifies the author's pretension. Fortunate it was for us that our long line of blockade was not subject to external attack from any foreign navy or from any foreign-built armored vessels carrying the flag of the Confederates.

The successful assaults upon the forts at Hatteras Inlet and Port Royal, and the operations in Pamlico and Albemarle Sounds, including the capture of Roanoke Island, are narrated in the succeeding chapters. Then follows a full and graphic account of the attack of the *Merrimac* on the anchored fleet in Hampton Roads and at Newport News, the destruction of the *Cumberland* and the *Congress*, and the subsequent action between the *Merrimac* and the newly arrived *Monitor*. So far as the fight itself was concerned, this last may be called a drawn battle, but it was in moral effect a victory for the Union navy, and a relief to the fleet in Northern ports and on the Southern blockade of a magnitude no longer realized. The necessity of providing for a Mississippi flowing "unvexed to the sea" was early recognized by the national authorities and the leaders of both the army and the navy, and the operations of the navy under Foote and at a later date under Davis and Porter receive considerable attention from our author, yet, so great was the need of condensation, less than the subject merits. Justice is done to the passage of the forts below New Orleans by Farragut, and the naval hero of the war is presented to us in the unaffected strength of his character. Ample justice is done to the fight in Mobile Bay. We especially commend the description of the stoppage of the *Brooklyn* and the column under the fire of the fort. In our opinion this is the best descriptive section of the book, and the most truthful account of a much-disputed phase of the passage of the Mobile forts. Here the author faces the subject properly, without gliding over it as he does over other controverted topics, such as the events that led to the overslaughing of Erben, the relief of Craven, the summary dismissal of Preble, the removal of Du Pont, the trial of Parker of the *Onondaga*, and the lifelong wrangle between Admiral Porter and Gen. Butler. On the whole, he leaves us unsatisfied, and, not forgetting the histories of Porter and Boynton, we feel that the history of the navy during the civil war has yet to be written.

The last portion of Mr. Maclay's present volume deals with the navy of to-day, and gets at once chronologically out of joint by describing such incidents as the Koszta affair, the attack upon the Chinese forts in 1856, and the Formosan and Corean expeditions. Even the mutiny of the *Somers* is referred to in this part of the volume with the mistaken statement that young Spencer was on board as an apprentice. Though most arctic expeditions are enumerated, no mention is made of the *Jeannette* expedition and of the touching and heroic death of De Long; and no reference to the successful relief of Greely by the expedition under the command of Schley.

It is not likely that another continuous history of the navy will be written for very many years, if at all, and it is to be hoped that this History, which supplies, though imperfectly, a distinct want, will be subject in the near future to a thorough revision. We observe that even the descriptions of vessels just tried and not yet departed upon foreign cruises contain unpardonable errors.

William Shakspere: A Study in Elizabethan Literature. By Barrett Wendell, Assistant Professor of English at Harvard College. Charles Scribner's Sons. 1894. Pp. 439.

On the first glance at the cover of this book, one is struck by the audacity of the title. New books on Shakspere usually are either introduced apologetically, or, what is worse, are thinly disguised by some euphuistic title that purposely fails to give a correct expression of the contents. Mr. Wendell, at any rate, is to be commended for both frankness and courage: he means to write about Shakspere, and therefore he calls his book by its proper name.

We may say at once that in the way of facts, dates, or additions to exact knowledge, there is here absolutely nothing that is new. Nor does the author make any such claim. In the first sentence he says: "The purpose of this study is to present a coherent view of the generally accepted facts concerning the life and the work of Shakspere." Were this all, the book would certainly have no reason for existence. But in the second sentence we read: "Its object, the common one of serious criticism, is so to increase our sympathetic knowledge of what we study that we may enjoy it with fresh intelligence and appreciation." Manifestly, therefore, the sole value of the book depends not upon the author's acquisitions as a scholar, but upon his penetration as a critic.

The method pursued is quite simple, and easy to follow—so clear and simple, in fact, that, in spite of the writer's vivacity, one feels at times a certain monotony of treatment. First, the known facts of Shakspere's life are given; then a very brief sketch of the Elizabethan drama up to 1587; the bulk of the work is taken up with literary criticism on each of Shakspere's productions in the generally accepted chronological order; an excellent summary concludes. To students of Shakspere there is much, even in the æsthetic criticism, that is now quite familiar; and yet the justification of the book appears not only in fresh and vivid restatements of well-known views, but in occasional entirely original discussions, with much fruitful suggestiveness concerning not only Shakspere, but literature, art, and life. Even when one violently disagrees with the author, one is almost sure to learn something; which is perhaps the highest tribute that can be paid to the professional teacher. Mr. Wendell's decided preference for "Twelfth Night" as compared with "As You Like It"; his belief that the Sonnets must have seemed to Shakspere "more important and valuable than his plays" (p. 224), and that the underlying mood of Julius Cæsar is "unpassionately ironical" (p. 243)—these and countless other statements will affect various readers in various ways. It is idle to defend or to combat such views.

The book suffers a little from a trait noticeable in some other writings of this author—an irrepressible fondness for paradox. Perhaps it is necessary nowadays to talk about Shakspere paradoxically, if one expects to receive any attention; but paradox too often passes for originality. For example, Mr. Wendell makes the point that on the Elizabethan stage madness was meant to be comic, as drunkenness often is to-day. No doubt this was occasionally true; but how many readers will agree with this statement (p. 295)? "Only when we understand that *King Lear*, for all his marvellous pathos, was meant, in scene after scene, to impress an audience as comic, can we begin to understand the theatrical intention of Shakspere's tragedy." How about *Ophelia?*

A few of the most valuable points brought out in the book are the comparison of "Venus and Adonis" with "Hero and Leander," and the subsequent inference that to Shakspere more than to any other English writer "words and thoughts seemed naturally identical" (p. 65); the explanation of the popularity of puns, artificial phrases, and euphuism on the stage, which Mr. Wendell says appealed to the audience in the same manner that catchy tunes in comic operas affect people at present; the discussion of the preponderance of the intellectual over the emotional in "Coriolanus," a play which "is such work as an artist, with what seems perversity, is apt to deem his best" (p. 342); and the constant insistence that Shakspere's development was artistic rather than personal.

Interesting as the book is even to special students, its chief value, we think, will appear if it is used as an introduction to the study of Shakspere. We are pleased to find in it none of the absurdities of the "inductive" school of criticism, which makes what should be a literary work seem like a text-book on graphic algebra or spherical geometry. The method here is absolutely sane and sound, the style is lucidity itself, fact is everywhere kept clear from inference, and there is no gush. There is not a silly sentence in the book. What reader of Dowden or Fleay can say that?

Apparitions and Thought-Transference: An Examination of the Evidence for Telepathy. By Frank Podmore, M.A. [Contemporary Science Series.] Charles Scribner's Sons.

This readable little volume is practically an abridgment of the work of that often named and oftener misunderstood body, the Society for Psychical Research, of which Mr. Podmore is one of the more active members. It gives in brief compass an account of the fruits (if fruits they be) of its industry; and one who wishes to know what "scientific occultism" is like can do no better than turn to its pages. The chapter-headings will give the best notion of what it contains. There is an introduction on methods and problems, and a finale on theories and conclusions; there are three chapters on

the experimental transference from one mind to another of simple ideas, sensations, motor impulses, etc.; six chapters on transference as it occurs not experimentally but, according to the theory the author believes in, spontaneously, as, for instance, in coincidental dreams, and in apparitions at the time of death; one on experimentally induced apparitions at a distance; one on collective hallucinations; one on clairvoyance in trance or mediumship; and one on clairvoyance in the normal state, including crystal-vision.

The first result of reading the book has been to make the present reviewer cease to wonder at the tenacity with which, in spite of the resolute opposition of orthodox science, beliefs of the semi-supernatural order retain their hold upon the mind. They are nourished by the constant recurrence of experiences of the sort here retailed, of which probably in all ages of history it would have been possible, with no extraordinary diligence, to compile a contemporaneous collection similar to those of which Mr. Podmore tells. And the second effect on the reviewer's mind is the sense the book gives him of the phenomena having, as it were, an essentially baffling nature. They are abundant; but in nearly every instance the proofs, however good up to a certain point, fall short of being quite coercive. Moreover, the phenomena are all so fragmentary, sporadic, and contextless that they weave themselves into no system. It almost seems as if it were intended in the nature of things that these events should be always present in sufficient measure to tempt belief, but always in insufficient measure to justify it. It is evident that what is needed to make the mind close upon telepathy, veridical apparitions, and ghosts, and embrace them, is a philosophical theory of some kind which has a use for such facts. But our philosophies and sciences have absolutely no place for them and no context to supply them with. It is probable, therefore, that Mr. Podmore's book will leave most readers in the baffled condition which Mr. Andrew Lang's recent book, 'Cock Lane and Common Sense,' expresses so well—a condition of being unable to drop the subject, but quite as unable to be sure that there is anything firm in it to hold on to.

One of the oddest chapters in the book is that on "experimentally induced apparitions." Since 1886 there have come to Mr. Podmore's knowledge no less than seven cases in which one person by strong concentration of will has made his phantasm appear to a friend situated at a distance. There is another case dating from 1822, and another one in which the nature of the effect is less clear. The evidence in most of these cases is complete, and would be "good enough to hang a man" for any other sort of crime than so appearing, so that the doubting reader's only resource is to suppose accidental coincidence or conspiracy to deceive Mr. Podmore and his colleagues. The theosophists would probably call it a case of projection of the astral body. Meanwhile lovers all over the world are more or less unconsciously pressing in the direction of this experiment, yet we get no reports from them of its success. Perhaps they don't do it with sufficient malice prepense, from not yet being acquainted with its feasibility. The present critic knows of one case, not in Mr. Podmore's book, in which it would appear to have succeeded. Repetitions of such a result, if they could be recorded with more frequency, would perhaps do as much as anything purely empirical could do to gain credence for the philosophy which Mr. Podmore professes. We therefore cordially recommend the attempt to all who have a stomach for psychical research and a good "power of concentration."

The Woman's Book; dealing practically with the modern conditions of home life, self-support, education, opportunities, and everyday problems. 2 vols. Charles Scribner's Sons. 1894.

THE observer of the constantly changing conditions of human life will take up these two volumes with a good deal of interest. They are admirable specimens of book making, and the illustrations in particular are very beautiful. What picture do they give of the needs and difficulties of the woman of the present day, and are the means they offer for the solution of her doubts such as will really conduce to higher and finer standards of living?

The numerous subjects here discussed fall roughly under three heads: one may be summed up as the spending of the family income and the conduct of the family life in a way consistent with the demands of civilized and artistic modes of living; one deals with the more serious aspects of life—the choice of an education, and of a possible or an actual means of support; and one with the practical details of keeping the house, of dressing, of managing business affairs, of taking care of the children, and of the problems of domestic sanitation and hygiene. The last of these three parts is thoroughly well done, but the subjects handled are rather less exhaustively treated than in 'Goodholme's Domestic Cyclopædia'; and that will continue to be an indispensable book in every well-regulated family. The advice and instruction given regarding occupations for women is also excellent, and quite equal to what one may demand of a printed guide; and the opinions laid down by Dr. Lyman Abbott in regard to the education and the appropriate range of activity of women may be taken as a fair representation of average cultivated opinion in these days upon questions which were not long since hotly debated. He says:

"First, woman is entitled, in her own right, to the highest and best education which can be given her—education not shaped to fit her to be a conventional type of wife and mother determined beforehand for her by man, but shaped to make her the noblest and truest woman. The best way to make a true wife and mother is to make a true woman. And, second, the formal and conventional restrictions on womanly liberty are to be removed—as to a large extent they have been—and she is to be free to find for herself her sphere, and to determine by her own unhindered and even aided experiments what she needs for the perfect development of her own nature. The law of liberty is woman's best safeguard."

This is reasonable language; but as regards one point in the education of the girl Dr. Abbott is certainly in error. While no course of education should be generally adopted which would have a tendency to unfit her for her probable future as wife and mother, and while this probable destiny may well be "kept in mind by parent and instructor, exactly as in the education of the young man it is to be kept in mind that he will naturally become a husband and a father," it is certainly not desirable that "the girl should be taught to look forward to marriage as her natural and probable destiny." The plain fact that the great majority of women marry she may be trusted to gather from her own powers of observation, and the extreme probability that she will herself, if she so chooses, fall under the common rule, will be quite certain to occur to her. But to teach her consciously to look forward to this end and to make preparation for it a distinct object in life, is neither necessary nor commendable. It is not necessary, because she can readily and naturally be taught to relieve her mother of household cares without ulterior aim; and a course of training in scientific housekeeping can now, in most parts of the country, be added to the scientific equipment which the model girl will have already had, in the course of a few months, when occasion has arisen for it. It is not commendable, for very obvious reasons; we have passed beyond the time when Dr. Johnson thought portrait-painting an impossible occupation for women, because it would be "highly indelicate in a female" to gaze upon the face of a possible masculine sitter; but if the pendulum had swung too far in the direction of delicacy in those days, it is still not desirable that the young girl should take a too practical and businesslike view of the possible fate that awaits her. Dr. Abbott himself points out the inherent vulgarity, which custom may enable one to overlook, in the practice of "bringing out" a girl as a sign that she is ready for the matrimonial market.

The remaining subject of the book—the artistic side of living—is discussed by Mrs. Burton Harrison, Eva Wilder McGlasson, and Mary Gay Humphreys in articles which in style, in method, and in the reserve which true good taste inculcates fall far below the rest of the volume, and are in no way deserving of more permanent form than the dreadful Woman's Page, so called, of the Sunday newspaper. We hear of "the subtle mysticism which glooms and shines upon the pages of Rossetti"; we are told that "it would be foolish, in our generation, to say we do not remember the houses where such artless forms [as being asked by the host whether one prefers white meat or dark] prevailed"; we are advised to prefer "one priceless clasp of plainly set jewels" to "a predominating glitter of wealth." The audience which it is sought to interest would seem to consist for the most part of the vulgarly rich, but occasionally there is a word of recognition for the "woman in those numerous walks of life which do not lead with pleasing annual sameness to the doors of the great ones who sit sublime above the fashions." All this is set forth with a lavish profusion of exclamation-points, as "A trifle to be considered—the eccentricity of wearing lace veils over the face at the play!"

It is customary for the reviewer to assume that books on the forms of social usage cannot be written otherwise than with vulgarity, and that there is no useful purpose which they can serve; but this is not exactly the case. It is true that by far the pleasantest and most effective way of knowing what to do on all occasions is by means of an unconscious imitation of what is done by the most admirable of one's friends, and it is also true that the natural boor cannot be made into a gentleman by rules. But between the natural boor and the happy possessor of admirable friends there is a medium range of individuals whose ways of living can be made more pleasing by instruction. That instruction of this kind is hardly ever to be found which is free from the taint of vulgarity, and which is not therefore wholly injurious instead of beneficial, is perhaps susceptible of explanation. Those who really know have their knowledge largely in the tips of their fingers—it belongs, that is to say, to the unconscious part of their mental furnishing; it is (to compare great things with small) like the power to do of the artist which cannot be

put into words, nor even brought within the conscious field of reflection, so far as that can be done at all, without losing the delicate quality which is the secret of its charm. The "real thing" is incommunicable, and to attempt to reduce it to speech is too often to destroy it. It is needless to remark, therefore, that anything which can be properly done in this way must be of a very plain and simple kind, and above all that it must be expressed in plain and simple language, wholly without rhetoric, good or bad. To treat such matters in a lively and playful style, even if it were a good style, is to show a quite hopeless lack of the finer feeling which must pervade instruction in the arts of living if it is not to do more to corrupt than to refine.

Three Periods of English Architecture. By Thomas Harris, F.R.I., B.A., etc. London: B. T. Batsford; New York: Charles Scribner's Sons. 1894.

It would not be surprising to find an English architect of to-day arguing for a return to the Elizabethan manner, if it were for a permanent model, because the English have been for two or three generations searching their own history and other people's, in a very catholic spirit, for an architecture which they could adopt and stick to. But Mr. Harris, in 'Three Periods of English Architecture,' proposes Elizabethan only as a stepping stone to the development of a coming architecture out of English Gothic by infusion of classic elements; and this surprises us. We have believed that the world was right in agreeing that English Gothic at the period of the Tudors was senile and worn out. Mr. Harris thinks that it was still virile, and that the Victorian architects, instead of "harking back" to the thirteenth century, should have followed Pugin in beginning at the fifteenth, but should have gone on from there in the line which was indicated by the buildings of Elizabeth's reign. He would have them now hark back to that reign, and, shunning the ways of Inigo Jones and his followers, develop the style of the future, with the help of modern materials and the guidance of modern requirements, into a harmonious fusion of Gothic and Classic, prefigured by Elizabethan design, in which Gothic influence should be predominant. His Three Periods are the past (the Tudor past), the present, and the future, characterized as At work, Asleep, and Awaking: the first set forth in a slight historical sketch, the second and third in a conglomerate of citations imbedded in a thin matrix of his own thought.

Mr. Harris's conclusion is that a new architecture is to be hoped for; that it must be founded on the last phase of Gothic; that external polychromy will be one of its chief characteristics; and that it is by use of essentially modern materials that the path will be opened for it. If it is safe to prophesy at all, these forecasts are probably as safe as any, and there is much to encourage them. The danger is in prescribing the Gothic starting-point, and in the somewhat inconsistent doctrine—which we had hoped was on its last legs, but of which Mr. Harris makes much—that style need not be cared for in the new development, but may be left to evolve itself out of constructive exigency, and will result, as is here quoted from Mr. Eidlitz, "in a species of art form which speaks forcibly of mechanical work done, and is hence possessed of beauty." Of this last dogma, which is pure assertion, quite unsupported by evidence or argument, but has taken a singular hold on the common mind by mere virtue of the iteration of a number of clever writers, we may say in simple illustration that the perforation of an armored ship speaks very forcibly of mechanical work done, but few are found who think it possessed of beauty.

That metal architecture, in which Mr. Harris puts his trust, has a future before it is probable—it may even be a determining factor of the coming style; but we may remember that it has already in a generation made two false starts—one in the hands of architects as a hollow imitation of stone in cast iron, the other in the hands of mechanics as sheet metal simulating anything but itself. Perhaps a third effort may be more successful if the new material contents itself with the simpler function of furnishing the skeleton, to be clothed with other material. That is the direction in which Mr. Harris looks, and the direction in which, with the help of engineers, iron architecture is developing, especially in the United States; but under this limitation the metal is much handicapped in its influence on outward form and style. It is among the possibilities that it is now the destiny of architecture to be regenerated by engineers and builders—a destiny that has been predicted for it more than once; if so, we will venture the single prophecy that the path of its regeneration will be long and rough and painful.

Lest we give a wrong impression of Mr. Harris's book, let us make haste to say that he writes with knowledge, temperance, and sense, and that he has made an interesting anthology of other writers' utterances. The exception we take is to his point of view, and chiefly in the two things we have noted—the proposition to make a fresh start from decadent Gothic, which we suspect no one will heed, and the idea that beauty of design will come undesigned, as a by-product of constructive manufacture.

Memorials of Old Whitby; or, Historical Gleanings from Ancient Whitby Records. By Rev. J. C. Atkinson. Macmillan. 1894.

Dr. Atkinson's book is the antipodes of the average history of an English town. He does not waste his energy in entertaining gossip concerning local celebrities, in verbose excursions concerning the antiquity of the town, or in the minute examination of sepulchral inscriptions; he does not pander to the taste of those who love the fabulous and the non historic, especially if the story is told as they have been accustomed to hear it; he does not, like so many of his predecessors, take his history ready-made and without reference to the sources; nor does he ignore the more important phases of municipal development. In short, he displays the historical training and broad scholarship which are lacking in most town histories of England. Hence it is quite natural that Charlton and Young, the older writers on Whitby, receive some hard raps from Dr. Atkinson.

Most local historians of England dispose of the period before the Norman Conquest in a few pages filled with vague surmises and old legends regarding Roman and Anglo-Saxon times. Dr. Atkinson devotes about one-third of his book to the Anglo-Saxon period, following the fortunes of Whitby in the light afforded by the chroniclers, by later survivals, and by the study of philology. The chapters on the story of Cædmon and the influence of the Danish element in the district around Whitby are particularly interesting. Our author believes that in the original settlement of that part of Yorkshire the infusion "was rather of English blood and English idiom among the Danes, than of Danish among English." He seems to go too far when he asserts, on page 51, that all the services and exactions due to the Abbot of Whitby from his tenants in the twelfth and thirteenth centuries had existed before the Norman Conquest.

Of the later chapters two of the most instructive deal with the conditions under which the abbey tenants held their lands in the outtownships, and with the meaning of burgage tenure. We doubt the validity of the statement on page 288 that the word "beverage" (which is used in an ancient charter of the town) by itself alone "almost furnishes an irresistible inference as to the preëxistence of at least a quasi-gild, a fraternity, a society of some sort." The requirement that the buyer of land should give one penny to the burgesses "for beverage," may imply some sort of municipal organization among the townsmen, but it does not necessarily imply that they were organized into a gild. In the same chapter the author contends that, as early as the twelfth century, there was in Whitby a corporate governing body with a certain measure of autonomy; but the authority of that body must have been quite limited in view of the fact, admitted by the author (p. 298), that the Abbot retained the jurisdiction, the nomination of town officers, and certain rights over the burgage tenements. This would leave little room for municipal autonomy.

The book is not a systematic history of Whitby, but rather a series of essays on the most important phases of its mediæval development. The arrangement of the matter would perhaps have been improved if kindred topics had been treated together or consecutively; as it is, the ecclesiastical and strictly municipal parts of the story are intermingled somewhat promiscuously. The work as a whole, including its numerous illustrations, deserves praise, not censure; if every English town had such an historian, we should soon be able to make satisfactory generalizations regarding the municipal development of mediæval England.

The Nation.

NEW YORK, THURSDAY, JANUARY 17, 1895.

The Week.

THE substantial defeat of the Carlisle currency bill does not spare Congress the necessity of passing a bill for the relief of the Treasury. Some measure for the sale of bonds until the revenue becomes equal to the expenditure is imperatively required. The present condition was foreseen even before the Harrison Administration went out of office. Secretary Foster discussed it in a public speech, and said that, if all other means failed, he should issue bonds under the act of 1875, as Secretary Carlisle has since done. The reason why Congress has done nothing to anticipate the exigency, or to meet it after it came, is that each party was bidding for the votes of Populists, Silverites, Coxeyites, and Blatherskites. A certain number of catchwords have come into use among these people during the past quarter of a century while the green goddess of legal-tender has held sway, which are supposed to contain all the truths of financial science. Chief among these are the phrases "money power" and "Wall Street." To be in any way connected with the "money power" involves the loss of a certain number of votes. Such is the supposition, at all events, of timid and time-serving politicians. Government bonds are, of course, associated with the "money power." Hence, any vote in Congress to issue more bonds, no matter what the purpose or how dire the need, exposes the timid and time-serving members of that body to the charge of "subserviency to Wall Street." Repealing the Sherman silver act was all the subserviency to Wall Street that this Congress could stagger under. This is the reason why no bond bill could pass, not even an amendment to the present act to enable the Government to get better terms in the sales which it is compelled to make or go into bankruptcy. Such an amendment would be construed as an admission that the right to issue bonds under the act of 1875 still existed. As all the Populists, Silverites, Coxeyites, and Blatherskites denied this right, the average Congressman shied at it like a frightened horse. Neither whip nor spur could bring him up to it. But we think he will have to come to it before this Congress adjourns, or he will see the next Congress in session very close at his heels.

It was a great mistake of tactics not to allow a vote to be taken on the State-bank proposition first. This section of the Carlisle bill was the part which consolidated the Republican vote against the whole measure. It is very plain that the State-bank feature was thrown in, not because it was desirable *per se*, but because it would "catch votes" outside of Congress. But, however that may have been, the existence of that feature rendered it necessary to carry the bill by Democratic votes solely. If the Republican demand for a vote on that section at an early stage had been conceded, it is more than likely that the few votes needed to adopt the programme of the committee on rules would have been gained. It is pretty certain, too, that that section of the bill would have been knocked out. What might have been the fate of the bill without that clause is matter of conjecture.

The time is very short, but it seems as if it might still be possible for Congress to empower the secretary of the treasury to take advantage of the exceptionally favorable condition of the money market. If money is lent in large amounts at one per cent. or less, why should not the Government borrow at that rate? If it be said that such money is lent only upon demand or for short periods, the reply is that those are precisely the terms which will suit the Government. No one doubts that in a short time the revenue of the Government will be in excess of its expenditure. The surplus would then naturally be applied to the payment of its debts, but the debts created by issuing bonds cannot be paid for many years to come, and meanwhile the surplus will probably be wasted as the last Republican Administration wasted it. Were the Treasury authorized to sell exchequer bills, at such rates of interest as prevail from day to day, payable at short terms or on demand, it is certainly reasonable to believe that it would share in the benefit of the low rates now existing. There is plenty of money to loan, and it is scarcely credible that the Treasury would not be favored as a borrower. Whatever may be the ultimate solvency of the Government, few would doubt that it would honor its paper for a few months; and before the present executive is displaced the emergency will probably have passed. Whatever the ultimate standard of value may be, we shall not see any change while Mr. Cleveland holds office, and few bank presidents would decline to lend on call to the Government at 1 per cent. when they could do no better with private customers. If the Democratic party in Congress could bring itself to propose such a measure as this, it would at least go out of office with honor. If it does nothing to restore the public credit, it will add disgrace to defeat.

The United States Senate seems to be stuck in its own mud again, as it was during the pendency of the Sherman repeal bill. A very competent observer, who is also a member, Mr. Vest of Missouri, is quoted as saying that no measure can pass that body, at this session, if five Senators are determined to prevent it, because the Senate has no rule for terminating debate. He says that this is the reason why no bill can be passed to repeal the discriminating duty on German beet sugar, which is causing enormous difficulties in our export trade. It is generally believed that any bill which might be sent by the House to the Senate for the relief of the Treasury would fail in the same way. It certainly would fail if five Senators were disposed to talk out the session, by reading essays and disquisitions like the silver speeches of Stewart and Jones and the tariff speeches of Quay. The situation is clearly revolutionary. "If the majority cannot govern, the minority must," and when that condition is reached, a revolution will have been accomplished. Suppose that the House should repeal its rules for closing debate. The result would be that any five members could stop the passage of appropriation bills and starve out the Senate and everybody else. In that event we should be able to start a government on this continent *de novo* and get rid of the present imbecile Senate.

There was cold comfort for Admiral Walker in the Hawaiian correspondence sent to Congress last week. His wonderful despatch of last August is now shown not only to be filled with Jingo nightmare (that was clear on its face), but to be positively mendacious in its statements and implications. "I consulted with the American minister," he wrote, "whose views coincided entirely with my own." But the said minister has now been heard from, and shows that the Admiral is ready to take liberties with the truth as well as with his superior officer. Minister Willis, in fact, diplomatically makes light of Walker's horrid tale of British machinations, and adds, what is far worse, that the Hawaiian Government is living on very good terms with England. This is strikingly confirmed by the Hawaiian request for the permission of the United States to allow the projected cable between Canada and Australia to be landed on Necker Island. The Hawaiians declare that they want this done, for the sake both of the money they will get by it and of telegraphic communication with the outside world; and our shallow President recommends that they be allowed to have their way. But we are glad to see that there are patriots at Washington who will withstand such transparent folly. The unsuspecting Hawaiians may think in their innocence that they want a British cable landed on their soil, but we know better. They cannot have it. What they really want, whether they think so or not, is an American warship.

The decision of the Court of Appeals of the District of Columbia declaring the sugar-bounty provision of the McKinley law unconstitutional, enunciates economical doctrine which it is refreshing to hear. The court points out that the right to give such a bounty to a class of people involves the right to tax all for the benefit of this class, and that the power of taxation is "limited to public objects and purposes governmental in their nature." As for the claim that "the general welfare" clause of the Constitution may be stretched to encourage the production of sugar by a bounty, the decision makes short work of it. Says the court:

"If Congress be conceded the power to grant subsidies from the public revenues to all objects it may deem to be for the general welfare, then it follows that this discretion renders superfluous all the special delegations of power contained in the Constitution and opens a way for a flood of socialistic legislation, the specious plea for all of which has ever been 'the general welfare.'"

The fundamental question involved in this sugar-bounty matter has never been passed upon directly by the Supreme Court of the United States, but the decision of the District Court points out that the principle which underlies it has been ruled upon by the court of last resort, particularly in the celebrated opinion of Justice Miller, holding that the Government cannot take property from citizens to bestow it on favored individuals. There can be no doubt that the courts here reflect the predominant sentiment of the people, and it is safe to say that Congress will hereafter be slow to endorse the bounty system.

The committee of architects who drafted the bill which is before Congress reorganizing the supervising-architect's office at Washington are making great efforts to secure its passage before the present Congress adjourns, and they ought to have no trouble in succeeding. The bill has the hearty support of Secretary Carlisle and of all the leading architects of the country, and the practically unanimous support of the press. What it does is to create a commission, to be appointed by the President, consisting of "three architects of high scientific and artistic attainment and large practical experience, and two officers of the Engineer Corps of the United States Army." This commission, under the general direction of the secretary of the treasury, is to discharge all the administrative duties relating to the procuring of designs and the appointing of architects for all buildings hereafter erected by the Government. The secretary of the treasury is to be president of the commission *ex officio*, and the supervising architect is to be its secretary and to act as general superintendent of the department, but to have nothing to do with the designing and preparation of drawings and specifications. The design of the bill is to bring to the aid of the Government the best expert architectural talent of the country, in order that future Government buildings may be constructed in such manner as to reflect honor upon us as an enlightened and progressive people. It does not interfere with the present system, but makes it possible for that system to accomplish the best and most artistic results. It will not add to the cost of public construction, but will, through better supervision, quicker and better work, save the Government large sums annually. The bill ought to pass without delay. It has been reported from committee in the House with strong approval, and it is now regularly before that body. The Senate should act upon it promptly, and both houses pass it as a pressing measure preeminently in the interest of the public welfare.

Democrats and Republicans have just been put to the test in the matter of surrendering a governorship to the Opposition on a narrow majority, and the Republicans make the better showing. On the face of the returns the Republicans elected their candidate for Governor of Tennessee by a few hundred votes, while the Democrats retained the Legislature. In California, on the other hand, the Democrats secured a small majority in the contest for Governor, while the Republicans control the Legislature. In California the Republicans have promptly surrendered the governorship to the man who was elected, while in Tennessee the Democrats are keeping out the man whom the people elected, on the pretence that there were frauds which the Legislature must investigate, and propose to have the Democratic incumbent hold over pending such an investigation. There is absolutely no defence for this course, and it only illustrates the fatal capacity of the Democratic party for blundering.

It is impossible to look upon the organization of the Assembly which Tom Platt, through Speaker Fish, has effected, otherwise than as a challenge to the reform sentiment of New York city. Out of thirty-six chairmanships, twenty-eight are assigned to members from districts of the State outside of this city and Brooklyn. Of the remaining eight chairmanships, Brooklyn has six and New York two. And what are New York's two? Mr. Conkling, who is an expert on city politics and government, is assigned to the chairmanship of the committee on lands and forestry, and Mr. Lawson, whose experience as a legislator is confined entirely to city matters, is placed at the head of the committee on trades and manufactures. What delicious jokes these assignments must seem to Platt! At the head of the committee on cities is placed Mr. O'Grady of Monroe County, who injured his reputation as a man of independent character by abandoning his claims to the speakership early in the contest and withdrawing in favor of Fish. In short, the organization of the Assembly is precisely what everybody familiar with Mr. Fish's public record might have expected it would be. He has never failed during his career to cast his lot with corrupt and tricky politics. His natural taste is in that direction; and, with Platt as his guiding spirit, he can be depended upon to gratify that taste to a more unlimited extent now than ever before.

It seems impossible for Platt's pastors to keep out of politics. He had to move away from Dr. Parkhurst's preaching in order to enjoy his devout Sabbath meditations in the sanctuary undisturbed by allusions to sinners nearer our day than Ahab or Judas, and we read with much sympathy the report of his evident edification under the ministrations of his new pastor, last Sunday. He "joined in the singing" with his old-time zest, and settled back to thorough enjoyment of a sermon without a single unedifying reference to sins any modern is inclined to, being, in fact, "all about the Waldenses." Yet what does his new non-political pastor do the very next day but go to a pastors' association and denounce a "scheme" of Mayor Strong's and the German Reform Union to allow the people to say whether they want saloons open on Sunday afternoons, and so "have our Sabbath voted away from us"? This political activity of his new pastor will pain Platt deeply. He thought he was now safe from such religious embarrassments. Still, the cause is one which appeals to him strongly. His strict Sabbatarian principles are almost as strong as his bi-partisan convictions. Rather than have one saloon legally open on Sunday, he would have fifty illegally open, provided the blackmail were collected and distributed in an orderly bi-partisan manner. The Pastors' Association may count upon Platt in this fight for the American Sabbath. All he will ask of the pastors in return is their aid in *his* fight for the American Boss in city politics, and we must say the chances are that he will get it.

Mayor Strong's message, coming after his appointments to the few places he has filled, is an additional assurance to the public that he has not forgotten the pledges which he made before election. He declares that "municipal administration can and should be made a matter of practical business, differing chiefly in the magnitude of interests involved," and that he shall endeavor to name for office "men whose capabilities are their endorsement." His appointments thus far have been on a level with these professions, and in this respect his conduct is in refreshing contrast with that of his Tammany predecessors, who, while making the most extravagant professions of determination to fill the offices with only the best men, regularly filled

them with the worst. Mayor Strong shows practical wisdom also in refraining from more than brief comment upon the various municipal departments until he has examined their condition and needs. He will in this respect follow the example set by Mayor Hewitt in 1888, and send a series of special messages to the Board of Aldermen, taking up the departments, one or more at a time, reviewing them and making suggestions which will "enable our fellow-citizens to clearly understand the somewhat complicated management of public affairs." Mayor Hewitt's special messages were the most instructive and valuable documents of their kind ever put before the community; but the public mind was so little alive at the time to the need of an honest and intelligent government of the city that they commanded very little attention. Mayor Strong will address the public in a much more favorable time, and we have little doubt that the response to his suggestions will be far more encouraging than it was to Mayor Hewitt's.

We have no wish to depreciate Superintendent Byrnes on mere suspicion, or any ground which he has not himself supplied. But we must say again, as we have said before, that the accumulation of a fortune while in the police service by means of police services secretly rendered to outsiders, is likely to destroy his influence over his subordinates. Besides this, the mere knowledge that such accumulation is possible is enough to ruin the *morale* of any man in the police who has once risen above the ranks, if he sees that it can be made without discredit. It is sure to make him despise his regular pay and to set him looking out for lucrative jobs. This would be true if the police force were now all it should be. But in its present venal condition the example would act on it with redoubled force. In addition to this, Superintendent Byrnes is disliked and distrusted by a very large proportion of the voters who have brought about the present opportunity for reform. Would it be wise for Mayor Strong to fly in the face of this prejudice, even if it be ill founded, and try to reform the force through instruments in which the public would not have thorough faith? It is not as though there was nobody but Superintendent Byrnes to do the work of reorganization. There are at least two or three gentlemen available and thoroughly competent for it, with whose motives and characters no fault can be found. Nothing is more necessary in an administrative reform than to avoid the retention of discredited agents. All who have for any reason forfeited the public confidence should "go." Superintendent Byrnes has rendered great services to New York city in the last thirty years. This should not be forgotten in spite of all that has happened. But there prevails everywhere but in New York a salutary custom which compels men in high places to retire when public trust in them has been weakened, and we think Superintendent Byrnes should obey it, even if Sheehan does not. Mayor Strong may rely on it, nothing but new brooms will do the work he has in hand.

In the published statement of Jay Gould's personal estate there appears among the claims the following item and entry: "S. B. French, $9,716.04, no value." French is our old friend Steve, of the Police Board, the famous "bi-partisan." He declines to say why Jay Gould paid or lent him this sum, but it is entirely safe to say that Gould did not give it to him except for full and adequate return of some kind. It cannot have been lent on Steve's note alone. It was given, of course, while Steve was in active service as a "bi-partisan." We wish very much that Steve would give us a full and frank explanation of the transaction, as it might throw light on Gould's other relations to the Police Department.

The attempt of the Governor of Texas to secure under the extradition law the sending to that State of men who have never been within its limits, on the claim that they have violated the anti-Trust law of the commonwealth, is followed by the refusal of an Ohio judge to surrender to Kentucky one of her criminals on grounds quite as untenable. A negro named Hampton, under indictment for a crime in Kentucky, escaped to Ohio. He was arrested, and his case was taken before Judge Buchwalter of Cincinnati. The papers were in regular form, but the judge refused to order Hampton's surrender unless he could have a letter from the Governor of Kentucky and the sheriff of the county where the crime was committed, giving assurances that he would be protected from a mob and given a fair trial. The judge's defence was that he had lately sent two colored men back to Kentucky and Georgia, both of whom had been lynched. Gov. Brown of Kentucky very properly treats the demand of the judge with contempt. He easily shows that it contravenes the Constitution of the United States, which says that a person charged in any State with crime "who shall flee from justice and be found in another State, shall, on demand of the executive authority of the State from which he fled, be delivered up, to be removed to the State having jurisdiction of the crime." It would be as absurd to hold that the authorities of one State must be satisfied with the administration of justice in another State before they would surrender a criminal as to maintain that a man who, it is claimed, is connected with a combination that has violated the laws of a State, can be treated as having fled from justice when he never was in the State. This is true even if, as is alleged, the Ohio judge has, in a State statute, some color of justification for his action.

The encounter between the Rev. Lem Penrod and Mr. John Slate at Grassy Creek, Kentucky, the other day, on the subject of infant baptism, will, we fear, cause a good deal of unreasonable scandal. Finding it impossible to get Slate to take a proper view of this important ordinance, Penrod drew a revolver and shot (probably merely as a warning) at Slate's leg, the ball passing through his boot. Slate, instead of taking this in a proper spirit, "rushed at the minister," whose resources at close quarters were not, however, exhausted, for he produced a butcher knife and endeavored to slash Slate's abdomen, but only reached his trousers. Friends then stopped the fray. This attempt on Slate's abdomen we cannot excuse, Slate's head being the real seat of his error; but in a fray it is, of course, difficult to plant one's blows where they will do the most good. But we must not too hastily condemn the Rev. Penrod's methods, for infant baptism is by no means the only doctrine erroneous views on which have been corrected with the knife or the bullet. There is hardly a single theological error which in times past has not been corrected by cuts, bruises, and burns. Penrod is simply an anachronism, but we trust he will keep an eye on Slate, and get him right somehow eventually.

The output of books is a good trade indication, and, judging by the returns of the English book-market, to be found in the *Publishers' Circular*, the year 1894 shows a considerable recovery from the world-wide financial depression. More new books by 171 were published in 1894 than in 1893, while the reprints—that sure sign of distress or uncertainty in the book-making business—were less by 68. Coming down to the classifications, we find theology scoring its customary increase, but science, education, and law increasing in still greater proportion, while belles-lettres and essays beat them all, the advance in the latter case being from 96 new issues in 1893 to 370 in 1894. Novels and tales jump from 935 to 1,315, but this is pretty well balanced by the decline in juveniles from 659 to 269. The question of accurate classification comes in here, as the *Circular* observes, and the difficulty of shading off stories told for the young from tales in general may account for the ups and downs in the two sets of figures. A better way would be to reckon both classes together, and then we should find the general group of fiction to have been about stationary in point of number in the two years. On the whole, the literary year shows a picking up of courage on the part of publishers. The American figures will probably reflect, as they usually do, conditions similar to those given for the English trade.

INTERNATIONAL ARBITRATION.

THE subject of international arbitration has been brought to the attention of the people afresh by the presence here of Mr. Cremer, the president of the Peace Society of Great Britain. It is forgotten, apparently, that Mr. Cremer comes hither at our own invitation. This invitation was publicly communicated in the proceedings of the International American Conference, held during Mr. Harrison's administration under the presidency of James G. Blaine, secretary of state. This conference assembled at Washington October 2, 1889. It remained in session under the presidency of Mr. Blaine till April 19, 1890. On the 17th of April it adopted a project of a treaty for the settlement by arbitration of all international disputes with one exception, which exception was in the following words:

"Art. IV. The sole questions excepted from the provisions of the preceding article are those which, in the judgment of any of the nations involved in the controversy, may imperil its independence; in which case, for such nation, arbitration shall be optional, but it shall be obligatory upon the adversary power."

The plan was supported and voted for by the representatives of all the conferees except Chili. In its preamble it recited that war is the most cruel, the most fruitless, and the most dangerous expedient for the settlement of international differences; that the growth of moral principles among civilized peoples has created an earnest desire for the amicable adjustment of such differences; that the conference considered it a duty to lend its assent to the lofty principles which the most enlightened public sentiment of the world approves, and accordingly did "solemnly recommend" all the governments there represented to form a treaty of arbitration on certain lines, which it proceeded to indicate.

Whenever a project for a general plan of arbitration is proposed, the Jingoists, with an air of superior wisdom, tell us that anybody who sits down and attempts to draw up a working scheme will find it entirely impracticable. The International American Conference did not find it so. On the contrary, it discovered and proved that the only obstacle in the way of a general plan of arbitration hitherto had been an unwillingness to enter into it. All difficulties were composed as soon as the parties desired to compose them. The project provided that arbitration should be obligatory in all controversies concerning diplomatic and consular privileges, boundaries, territories, indemnities, the right of navigation, and the construction of treaties, and in all other cases, with the single exception noted, even though the controversies antedated the present treaty. It was provided that courts of arbitration should be appointed jointly by the governments concerned, and that in case they could not agree, each government should appoint an equal number, and the arbitrators themselves should appoint an umpire, who should vote only on questions where the arbitrators failed to agree. The court of arbitration might select its own place of meeting unless the governments concerned should agree upon a place. All questions should be decided by a majority vote, even though a minority should withdraw from the conference, and in such case the majority should continue in session until all the questions in dispute were decided, and the decisions of the majority should be final. Nations entering into the agreement were not allowed to withdraw except with the consent of all the others. The agreement was to continue twenty years, and until one of the parties should give one year's notice of its desire to withdraw. It should remain in force as to the others until they gave similar notice.

The next day, April 18, the following proposition was reported by the committee on arbitration, and was adopted:

"The International American Conference resolves: That this conference, having recommended arbitration for the settlement of disputes among the republics of America, begs leave to express the wish that controversies between them and the nations of Europe may be settled in the same friendly manner. It is further recommended that the government of each nation herein represented communicate this wish *to all friendly powers*."

An additional resolution was adopted declaring "that the principle of conquest shall not, during the continuance of the treaty of arbitration, be recognized as admissible under American public law." Finally Mr. Blaine declared that this was a new *Magna Charta*, and the greatest work of the conference. He said in his concluding speech:

"If, in this closing hour, the conference had but one deed to celebrate, we should dare call the world's attention to the deliberate, confident, solemn dedication of two great continents to peace, and to the prosperity which has peace for its foundation. We hold up this new *Magna Charta*, which abolishes war and substitutes arbitration between the American Republics, as the first and great fruit of the International American Conference. That noblest of Americans, the aged poet and philanthropist, Whittier, is the first to send his salutation and his benediction, declaring, 'If, in the spirit of peace, the American Conference agrees upon a rule of arbitration which shall make war in this hemisphere well-nigh impossible, its sessions will prove one of the most important events in the history of the world.'"

It may be affirmed that our status on the subject of arbitration was well fixed by the two great precedents known to the present generation; that of Geneva on the *Alabama* claims, and that of Paris on the Bering Sea question. These were notable triumphs in the direction of "peace on earth and good will towards men," but it needed, perhaps, the broad generalization of the International American Conference to distinguish us among the world's great powers as the champion of this mode of settling international disputes. It scarcely needs to be said that a treaty of general arbitration, like any other treaty, may be denounced in an extreme case, and that each nation is the judge of the circumstances constituting an extreme case. The value of such a treaty is that it gives the initiative and the advantage to the friends of peace in every case of international dispute, and compels the Jingo party to play second fiddle. It puts a moral compulsion upon the nation to try peaceful methods first. And so it will be found in nine cases out of ten that war is avoidable.

SOCIAL DEFENCE AND PROGRESS.

A SORT of league has just got under way in Paris called the "Comité de Défense et de Progrès Social." Founded by Anatole Leroy-Beaulieu and like-minded men, its aim is declared to be to make a stand against the growing perils of socialism. By means of public lectures and pamphlets, and by political organization, if necessary, it hopes to vindicate all that is excellent in the present social order, at the same time that it shows sympathy for all rational and feasible reform. The league is for advance movements as well as for defence. It makes no pretence that all is for the best in the best of worlds. Strong as is its conviction of the worth and necessity of such a social organization as we now have, it will not commit itself to blind and indiscriminate praise of existing institutions, but will admit their weak points, and work as heartily as any other for improvement. All it insists upon is that the whole structure shall not be destroyed under the name of improvement.

Such an initiative seems well conceived and likely to be of much use in France. That country has been too much given to creating a new heaven and a new earth overnight. Lowell called it a "French fallacy" to suppose that "a new system of government could be ordered like a new suit of clothes." To the slower and more tenacious Anglo-Saxon this would seem as unreasonable as to order a new suit of flesh and skin. As Prof. Freeman said: "At no moment have Englishmen sat down to put together a wholly new constitution in obedience to some dazzling theory." Doubtless one reason of the ease with which French socialists get a hearing and credence and a political following is to be found in the traditional French facility in making new constitutions out of hand and voting-in the millennium on the spot. It is an encouraging thing, therefore, to find a body of influential Frenchmen coming over to the Anglo-Saxon view, that government and society are built up by painful efforts and slow accretions; that what we have laboriously acquired should not be given up at the demand of every theorist who comes along, and that even those reforms that can be shown to be urgent and possible should be entered upon only with caution and careful experiment.

A firm grasp of this truth is the chief merit of the article by Dr. J. H. Denison on "The Survival of the American Type" in the January *Atlantic*. Our system of government, our respect for law, our methods of local administration, the free course we offer individual and corporate enterprise, constitute a type, an organism,

back of which lie long centuries of struggle and sacrifice. Thus the issue with which socialism confronts us is: "Shall we develop the present forces, or shall we throw away nature's plan and give up the Anglo-Saxon organic nation in which law is reduced to a minimum?" It is the type itself which is on trial, which is struggling for existence. None of the schemes afloat in sentimental heads about a division of property, about the abolition of poverty and of grinding toil, is fairly and properly considered unless its destructive effect on the whole American conception of government and society is taken into the account. When that conception is felt to be attacked and imperilled, its defenders may be excused for heat and vehemence in repelling the assault.

Just here it is well to ask who are the most ardent defenders of the system of free competition and Government interference reduced to the minimum. It is common to say that they are the great capitalists, the large employers, the money kings. It is the men in Wall Street whom the Populists and Socialists think they are making "tremble" when they talk about confiscatory taxes and the state assuming control of all industries. But this is all a delusion. Great property is the least concerned about such matters. It can always defend itself. Who can imagine a man like Jay Gould caring very much about the kind of government he lived under? A collectivist government would have no terrors for him. It would mean only a few more officials to bribe, or, if the burden became too grievous to be borne, a grand smash and a new Cæsar at the head of affairs, with an aristocracy of wealth in which the Goulds would figure as dukes and viscounts. No, the men who really tremble and are saddened at the way in which short-sighted humanitarianism or reckless agitators would destroy in a year what it has taken centuries to build up, are the men who have at stake not so much their property as their sentiments and convictions. Just in proportion to their historical and political knowledge, just in proportion to the sympathy with which they have entered into the long struggle which has finally secured us freedom under law, do they dread and denounce crude plans of innovation.

Yet it is precisely these men, too, who are really the best and truest friends of reform and progress. This is an admirable thing in the programme of the French association referred to. It will not be put in the position of unyielding conservatism. It is for progress in what is good as well as for defence of what is good. It says to impatient schemers, Show us a reasonable prospect of social betterment without greater social damage involved, and nowhere will it be more welcome or find heartier advocacy. This is the attitude of rational and humane men in all countries. They suspect violent and sweeping changes. Reform which is to last they know has always come about, and they believe always will come about, by painful steps and slow. But they are no champions of stagnation. Of all men they are the ones who are most attentive to "the still small voice that speaks to the conscience and the heart, prompting us to a wider and wiser humanity."

END OF THE POLICE JUSTICES.

THE Committee of Seventy has done an extremely popular as well as wise thing in deciding to abolish the police-court system rather than to attempt its reform. The able and experienced lawyers to whom was assigned the work of drafting a reformatory measure upon this subject reached the conclusion very early in their deliberations that the present system was so thoroughly bad, and had become so thoroughly odious, that reform of it was out of the question. Death, instantaneous and certain, was the only adequate remedy for it. They therefore prepared a bill which abolishes both the system and the name, and which gives us in its place a new system of inferior courts of criminal jurisdiction, with nine city magistrates and five justices of the Court of Special Sessions. No man can become a city magistrate or justice who has not been for ten years at least in active practice as attorney and counsellor at law in the courts of the State.

Our present bench of police justices, fifteen in number, will give way to a bench of nine city magistrates, whose term will be ten years, and whose salary will be $7,000. The police-justice term is ten years and the salary is $8,000. This reduction in number brings the force of magistrates down to the court-house capacity of this city, and thus makes it possible for all the magistrates to be on duty every day. At present, since there are only nine places for the police justices to sit in, six of them are idle every day in the year. Divver was able to show on his recent trial that though he had been absent for weeks and even months at a time, he was no more neglecting his duties than were his associates. As a matter of fact, there was no excuse whatever for the increase of the number of police justices which was made in a Platt-Tammany "deal" in 1890, except to provide "places" for four more workers at $8,000 a year. The new bill undoes this act of public plunder, and also provides against possible neglect of duty hereafter by requiring that a city magistrate shall be in constant attendance in each of the courts between the hours of nine in the morning and five in the afternoon on every day except Sundays and holidays. The five city justices who are to constitute the Court of Special Sessions, are to serve for a term of ten years and receive a salary of $9,000 a year. They are to take the place of the present Court of Special Sessions, which is made up of three police justices, who are assigned by the full body of police justices, and who are allowed to sit alternately and as often and at such times as they may think expedient. The new justices are required to sit in every month of the year, and three of them must be present at every session.

It is evident from even this brief outline of the bill that the new system provides a method of inferior criminal justice which is as far removed as possible from the present system. In the first place, it abolishes utterly and for ever from the bench the Divvers, Martins, Meades, Hogans, and their kind by its requirement as to practice at the bar. Grady and Koch and a few others of the present list of indescribables are, we believe, nominally members of the bar, but the amount and kind of their practice are not such as would permit any mayor with reasonable respect for the law under which he was acting to appoint them to the bench. They were not put on the bench because they were lawyers, but for far different reasons. Every effort that has been made for the last quarter of a century to have the requirement of practice at the bar for a fixed period put into the law, has been opposed bitterly by Tammany and its Republican allies and has been defeated. This feature of the new law is likely to be the chief centre of attack now, for it will not merely put Justices Taintor and Meade, both Republicans, off the old bench, but will bar them from admission to the new. Still, it is the all-important feature of the new system, and must not be allowed to be either modified or omitted.

Nothing ought to be allowed to stand in the way of this, the most pressing and beneficent of all the reforms hoped for at the hands of the Legislature and Mayor Strong. It is impossible to overestimate the benefits which will accrue to the city if Mayor Strong is allowed to equip these new courts with upright, able, and honorable men. They will at once become the centres of law and justice, and cease to be, as they have been for years and are to-day, the centres of "pulls," politics, and injustice, and the actual allies of crime. They will become pure instead of impure fountain-heads of justice, protecting and aiding rather than oppressing and robbing the poor and the helpless, punishing rather than shielding criminals, aiding and directing the police in enforcing the laws rather than baffling them or conniving with them in violating the laws. Of all the shames which have fallen upon us as a city through Tammany rule, that of the police courts has been the blackest and most inexcusable.

We have entire confidence both in the supply of reputable lawyers for the new courts and in Mayor Strong's determination to put only men of that kind into them. The drafters of the new bill have concluded wisely not to reduce the salaries below limits which would make it possible for lawyers of character and ability to accept the positions. They have provided

adequate pay, and they have also provided that adequate service shall be rendered in return. In fact, their system creates for the city a dignified, intelligent, honest tribunal of justice for all classes, and especially for the poor and helpless, for the first time in our history, at least since Tammany became a power: and it will be a serious reflection upon our civilization and our capacity for self-government if we do not insist upon its adoption.

THE ARMENIAN TROUBLE.

THERE is imminent danger that the attempt of the European powers to interfere on behalf of the Armenians will come to nothing. England is the only one which is pushing vigorously for an inquiry today, and the Sultan is resisting her fiercely. He has long borne her a grudge as the most persistent of his persecutors, and this has been aggravated by the occupation of Egypt, concerning which the French lose no opportunity of inflaming his mind. Against this, however, England could contend if she had the hearty support of Russia, for Russia is the only power capable of coercing the Porte without much trouble or outlay. She could occupy Armenia at any moment, and the Sultan could do nothing either to prevent or avenge it. But Russia gives only a half-hearted support to the English remonstrances, and is quite ostentatious in her display of friendliness to the Turks. It is not impossible that, were the facts all known in Russia, there would be an outbreak of sympathy with the Armenian Christians not unlike that which followed the Bulgarian massacres in 1876, and led to the war of 1877. But pains are taken, as is credibly reported, either to prevent the news from reaching the Russian people or to minimize its importance. Germany turns a cold shoulder to the whole affair, following her policy of non-interference established by Bismarck in 1877, when he announced that he would not sacrifice one Pomeranian grenadier for the whole Bulgarian population. Italy's help, in the present condition of her morals and finances, is, of course, hardly worth considering. To crown all, the snow at the scene of the massacres is so deep, and the cold so intense, that it is doubtful whether commissioners and witnesses could get at each other, without great difficulty and hardship, for at least two months if not more.

All this brings out in a striking manner the value of the Eastern policy of Lord Beaconsfield, who was for twenty years one of the great Tory idols, and to whose memory they still burn incense. He stipulated, indeed, with the Turks at Berlin that the Armenians were to be well treated, but, as plainly appears, without the smallest expectation of enforcing the stipulation or of providing any means of doing so. In truth, he concluded a sort of defensive alliance with the Turks, for which the island of Cyprus was to be the consideration. But Cyprus has turned out not only a worthless possession but a great burden. The defensive alliance, moreover, is something with which the Turks would be glad to dispense, and the existence of which is offensive to Russia, for it provides that if Russia seeks to occupy any more Turkish territory, besides what she had already seized in the war, "England engages to join his imperial Majesty the Sultan in defending it by force of arms." It is now quite certain that England would do nothing of the kind, and would gladly be rid of the island of Cyprus.

Moreover, there is every likelihood that, during the coming summer, home affairs will withdraw English attention from most foreign topics. It is generally acknowledged by the Liberals that the dissolution of Parliament and a general election are near at hand, and the prospects of a Liberal victory are not good. Not only have the Home-Rulers "soured on" Lord Rosebery, as our politicians say, but the Independent Labor party is attacking the Liberals in the rear, and in many localities making a return of the Liberal members hopeless. It is quite possible that if the Tories came in, Lord Salisbury might seek to divert attention from home troubles by an active foreign policy; but one of the things in the democratic movement in England which most alarm Conservatives is the growing indifference of the masses to imperial or foreign affairs, so that the probabilities are in favor of some sort of fostering of socialistic nostrums for which the Tories have of late shown a strong taste.

What our Government can do in the Armenian matter, or whether it can do anything, is a fair subject for discussion. We have had one snub, in the attempt to take part in the inquiry, and, generally speaking, the methods of Turkish government are none of our business. But wholesale massacre is in our time the affair of the civilized world. It is not government, or a method of government. It is a crime against the human race. We can no more pass it without notice because we do not suffer from it, than pass pirates without notice on the high seas because they attack none of our ships. The whole of Christendom, including ourselves, has a right to refuse to treat a power which perpetrates such atrocities as are said to have occurred in Armenia, as within the pale of ordinary diplomatic intercourse. Diplomatic relations rest on the basis of a common civilization and common notions of humanity and justice, so that we might very well consider the refusal of the Porte to satisfy us as to the truth of the charges, as a good reason for an interruption of friendly diplomatic intercourse. The solemn warnings of Washington against foreign meddling, the wisdom of which has been proved by the experience of a century, do not touch this case. He denounces passionate attachments to, or passionate hatreds of, foreign nations. He denounces foreign influence on our domestic politics. He denounces political connections and permanent alliances with foreign states. But none of these warnings cuts us off from remonstrance with the perpetrators of gross cruelty or injustice, on a great scale, in any part of Christendom, and there is no nation which could speak with greater force for the common rights of humanity than we could, particularly just now, when every power in Europe seems to be approaching the Armenian horror with the Tammany question, "What is there in this for me?"

ALEXANDER IRELAND AND EMERSON.—II.

NEW YORK, January 1, 1895.

IN 1843 Mr. Ireland settled in Manchester. Carlyle's edition of Emerson's first Essays (1841) had excited much attention there, which was increased by the publication of the second series (1844). In 1845 the Manchester *Examiner* was founded by some Liberals of that region, among them John Bright, M. P., who during its first two years often wrote the leading articles. In 1846 Alexander Ireland became its managing partner, and held that position for thirty-five years. The new journal paid especial attention to literature, and by this means his literary friendships were greatly extended. One of his most important friendships was that formed with the eloquent lecturer George Dawson (whose Life he wrote, 1882), and while they were together on the Lakes (1846) Ireland visited Wordsworth. He had the happiness of completing the aged poet's collection of portraits with one of Ben Jonson. In the summer of the same year he derived great pleasure from the visit of Margaret Fuller, who (August 17, 1846) sends him the poems of Ellery Channing and "a sketch of travel in some of our Western States, by myself"; and on October 6 wrote him from London:

"I am much pleased to have your feeling of 'Margaret.' As you say, there are such things in real life, yet I fancy the picture, like that of an antique Venus, was painted from study of several models. The writer, Sylvester Judd (a name as truly American in its style as one of his own invention, Beulah Ann Orff), is a man approaching middle age who has heretofore only made himself remarked by one or two strokes of character of a kind noble and original. I have never seen him, but some years ago received from him this message, 'that he wished me to know I had one admirer in the State of Maine,' a distinction of which I am not a little proud, now that I have read his book. He is a clergyman, but it seems has not for that forgot to be a man. Time allows me now to say no more, except that I am ever, dear sir, in friendly heart and faith, yours, S. M. FULLER.—P. S. Should you see Dr. and Mrs. Hodgson and Mrs Ames, remember us [she was travelling with Mr. and Mrs. Marcus Spring] to them with grateful regard. I should be much interested at any time to know what any or all of you are doing for the good of others, and your own, what feeling, what hoping; to the new fraternity I think we belong, whose glory is service, whose motto *Excelsior.*"

Mr. Ireland was a good deal stirred by Margaret Fuller's accounts of Emerson's lectures and growing influence in America, and resolved to make an effort to get him to England. Mr. William Lloyd Garrison passed two

days (October 12, 13, 1846) in Manchester, and naturally received a hearty welcome from the manager of the *Examiner*, who seems to have followed him to Liverpool. At any rate, on the day when Mr. Garrison sailed for America, November 4, Mr. Ireland was on shipboard with him, and confided to him a pencilled note to Emerson, very brief, but pregnant with important results. In his reply to it ("Concord, 28th Dec., 1846") Emerson said:

"I was very glad to be reminded by your concise note, written on shipboard and conveyed to me by Mr. Garrison, of our brief intercourse thirteen years ago, and which it seems has not yet quite ended. Your affectionate expressions towards me and my friends are very grateful to me; and, indeed, what better thing do men or angels know of than an enduring kindness? In regard to your inquiry whether I shall visit England now or soon, the suggestion is new and unlooked for, yet opens to me at once so many flattering possibilities that I shall cheerfully entertain it, and perhaps we may both see it ripen one day to a fact. Certainly it would be much more practicable and pleasant to me to answer an invitation than to come into your cities and challenge an audience."

But Ireland was unwilling to have this matter adjourned, and again urged the visitation, no doubt after correspondence with friends. So I judge by a further letter (February 28, 1847) of which he (Ireland) gave me a copy, in which Emerson says he had "not anticipated so prompt an execution of the project as you suggest," and adds:

"I feel no call to make a visit of literary propagandism in England. All my impulses to work of that kind would rather employ me at home. It would be still more unpleasing to me to put upon a few friends the office of collecting an audience for me by much advertisement and coaxing. At the same time it would be very agreeable to me to accept any good invitation to read lectures from institutions, or from a number of individuals who sympathized with my studies. But though I possess a good many decisive tokens of interest in my pursuits and way of thinking from sundry British men and women, they are widely sundered persons, and my belief is that in no one city, except perhaps in London, could I find any numerous company to whom my name was favourably known. If I were younger, it would give me great pleasure to come to England and collect my own audience, as I have done at home here; and I have that confidence in my favourite topics and in my own habits, that I should undertake the affair without the least distrust. But perhaps my ambition does not give to a success of this kind that importance it has had for me. At all events, in England I incline rather to take than to give the challenge. You must not suffer your own friendly feelings to give the smallest encouragement to the design. It would be strange but most agreeable to me to renew our brief yet never-forgotten acquaintance of thirteen or fourteen years ago in Edinburgh."

Meantime Ireland had, as Carlyle wrote Emerson from Yorkshire, "awakened all this North Country into the fixed hope of hearing you." On March 18, 1847, Carlyle writes: "I had furthermore seen your Manchester correspondent, Ireland, an old Edinborough acquaintance too, as I found. A solid, dark, broad, rather heavy man; full of energy, and broad sagacity and practicality; infinitely well affected to the man Emerson too. It was our clear opinion that you might come at any time with ample assurance of 'succeeding,' so far as wages went, and otherwise; that you ought to come, and must, and would—as he, Ireland, would farther write you."

Ireland, who had many eminent friends, Leigh Hunt among them, not only wrote innumerable letters, but travelled to the more important places, enlisting every man and woman interested in literature, all "progressives," writing paragraphs in many papers. He created for Emerson's sake a higher order of lecture machinery and system than any then existing, one that lasted many years. The arrangements duly made and reported, Emerson answered, July 31, 1847:

"I owe you hearty thanks for your effective attention to my affair, which was attractive enough to me in the first proposition, and certainly assumes in your hands a feasible shape. I have a good deal of domestic immoveableness—being fastened down by wife and children, by books and studies, by pear-trees and apple-trees—but, after much hesitation, can find no sufficient resistance to this animating invitation, and I decide to go to England in the autumn. . . . Meantime, I beg you not to give yourself any further pains in this matter, which I fear has already cost you much. It will give me pleasure to speak to bodies of your English people, but I am sure it will give me much more to meet with yourself and other honoured individuals in private; and I see well that, if there were no lecturing, I should not fail to find a solid benefit in the visit."

On September 30 Emerson writes that he will leave Boston on a ship, not a steamer, the *Washington Irving*, October 5. On the 22d of that month he was with Ireland in Manchester, and the same evening at Carlyle's house in London. The details of Emerson's lecturing tour in England I have given in my 'Emerson at Home and Abroad,' but I have since found reasons for ascribing to it the dignity of a Visitation. He appeared at a moment when, as I heard J. S. Mill say, "Carlyle was turning against his friends." The causes of this revolution in Carlyle's mind, and whether it was in a right or wrong direction, cannot be discussed here; but certain it is that early in 1848 he began to be regarded by some sheep of his pasture as a doubtful leader. Frederick the Great began to supersede the Chartist in him. Throughout England his disciples flocked after Emerson, who kept up the old Carlyle standard. This was more than Mrs. Carlyle's flesh and blood could bear, and she angrily complained to a visitor (Espinasse) that he talked too much about Emerson. It was unwise in Froude to publish this ebullition of jealousy, and still worse to reveal the scar of the wound which Carlyle felt, but confessed to no mortal. Carlyle's long-healed wound was transferred and made fresh in the hearts of his old friends, and none felt it more keenly than Ireland, who wrote me:

"I am just now busy with Froude's new volumes. More ought to have been said about Emerson's never-to-be-forgotten solicitude for Carlyle's interests, and his regular sending of monies to him from the American reprints of his books, when he was receiving nothing from English publishers—thus keeping the Chelsea pot boiling. I am surprised and disappointed to find how he is spoken of by Carlyle. *E. g.:*

"'Emerson is now in England, in the North, lecturing to Mechanics' Institutes, etc —in fact, though he knows it not, to a band of intellectual *canaille*. [This is too bad. Emerson's audiences consisted of earnest and thoughtful men and women—just the kind of minds that sought strength and courage from Carlyle's own writings.] Came here and stayed with us some days on his first arrival. Very *exotic;* of smaller dimensions, too, and differed much from me, as a gymnosophist sitting idle on a flowery bank may do from a wearied worker and wrestler passing that way with many of his bones broken. Good of him I could get none, except from his friendly looks and elevated exotic polite ways; and he would not let me sit silent for a minute. Solitary on that side too, then? Be it so, if so it must be.'

"Contrast this with what Carlyle wrote to others about his admiration for Emerson, and with what he wrote to Emerson himself. [Here follow extracts, *e.g.:* "I do not know another man in all the world to whom I can speak with clear hope of getting adequate response from him."] I have a good mind to send these to the *Athenæum* to be printed in parallel columns with the extracts from Froude's book which I have given. It is difficult to reconcile these utterances of Carlyle."

It will be seen by reference to the Emerson-Carlyle correspondence that after Emerson had departed, Carlyle felt somewhat guilty (ii., p. 216, *seq*), and many times uttered his gratitude and affection. Never did I visit the Chelsea home but the first question of both inmates was concerning Emerson, and the last words Carlyle ever said to me (a short time before his death) were: "Give my love to Emerson. I still think of his visit to us in Craigenputtock as the most beautiful thing in our experience there."

This little history must draw to a close, though before me are many letters from Ireland, and some from Emerson, which tempt me to prolong it. When Emerson's house was burned in 1872, Ireland was the first of those who induced me to send from England proffers of assistance in rebuilding it (which Emerson gratefully appreciated, but declined), and when Emerson reached London (November, 1872), Ireland was already there waiting for him. The meeting between these old friends was touching. Emerson remembered individually the young scholars and thinkers whom Ireland introduced to him twenty-five years before, some of whom had travelled from distant parts of the country to sit at his feet in Manchester, where he had lived two months. No one was better able to give him account of each and every one of them than Ireland (whose correspondence, should it ever appear, will be a detailed history of scores of interesting men and women little known to the world, as well as of others who became noted). To quote Mr. Ireland:

"He spent the last two days of this, his final visit to England, under my roof, along with his devoted daughter, Ellen. This afforded an opportunity of bringing together many of his old friends and hearers of 1847–8, whom he was well pleased to meet. To every one he gave a few minutes, and the stream of conversation flowed on for several hours. After all the guests had departed he indulged in a cigar, and expressed his gratification at having met so many 'good people,' as he called them. 'Would that I could have held converse with each for half-an-hour.'"

I have perhaps said too little of Mr. Ireland's own contributions to literature, which are of high value. He had attained a unique position in England, was much consulted by literary men, and was honored with banquets by several literary clubs and societies. Nearly every literary American visiting England was entertained in his house. Among his dearest friends was Mr. Horace Fairchild, sometime consul in his neighborhood, with whom he has corresponded for many years. In 1865 he assisted Mr. Fairchild and an American friend of his in securing a complete set of the publications of the Anti-Corn-Law League, a unique collection now in New York. Ireland from time to time wrote literary articles for the Manchester *Guardian*, his last being one on the death of Oliver Wendell Holmes. He received many cordial letters from America—from Holmes, Lowell, Prof. Norton, Miss Peabody, and others. He possessed a grand library, which contained many rare volumes.

My aim has been mainly to call attention to the fact that Emerson's fruitful lecturing tour in England was altogether, and his wide influence there largely, due to Alexander Ireland. It is, I believe, well understood by those acquainted with Emerson's career, that he himself was greatly influenced as a public teacher by his experiences and friendships formed during that visit, and it is certain that he contributed much to the direction of the new life which Carlyle awakened but could not lead.

During my long residence in England I have been brought into personal relations with nearly all of Emerson's old friends, and they cherished his memory as that of the man who did most to mould their lives. Many are now dead, but a considerable number of them gathered with the large assembly which in September last listened, in South Place Chapel, to Edward Emerson, who, beside the bust of his father, pedestalled amid flowers, read to them the correspondence between Ralph Waldo Emerson and John Sterling.

MONCURE D. CONWAY.

THE LIBERAL PARTY.

LONDON, January 1, 1895.

THE Liberal party has met with a check in the result of the two bye-elections in Forfarshire and the Brigg division of Lincolnshire. In both cases there is a good deal to be said with truth by way of explanation. But the result remains, and, coming immediately after the question of the House of Lords had been formally raised by the Prime Minister, it shows that that question has not at once awakened a burst of enthusiasm. Liberals believe that the enthusiasm will come. The problem presents so many sides and offers so many alternatives that the country requires time to take it in, and it has been easy for adroit opponents of the Government, maladroit friends, and one or two malcontent adherents, to confuse the simple issue which is for the moment presented to the country—the predominance of the House of Commons. Meanwhile the bye-elections have revived the spirits of the Opposition. It is believed, at least in well-informed Liberal circles, that, in spite of the bluster of the Opposition press, the managers of the party were unwilling to precipitate a dissolution of Parliament. It may be that these recent successes have modified that view.

What the result of a dissolution might be, it is of course impossible to say. It may at first sight seem strange that in a country where the working-class electors far outnumber the rest, liberal government should not be sure of a substantial majority. The Liberal policy, at least for many years, after everything had been done for the middle classes, has been to extend or rather to create the political power of the workingman, to cut down every privilege in which he did not share, to shift burdens on to other shoulders than his. If I am not mistaken, Lord Salisbury published a magazine article two or three years before the franchise was extended to householders in counties, in which he assumed that, even then, under the existing distribution of seats, a Liberal majority must be permanent, and the subsequent Redistribution Act effected nothing to make the prediction less probable. It has not so turned out; but the truth is that, over and above the natural force of conservatism, which is powerful in every class in an old, prosperous, free, and, on the whole, well-governed country, there are stumbling-blocks in the path of the Liberal party, and hindrances from within sufficient to account for the party being weaker than it ought to be.

Take, for example, the politicians who describe themselves as the Independent Labor party. It has as yet only one representative in the House of Commons, Mr. Keir Hardie, who has expounded its objects in an able article in the new number of the *Nineteenth Century*. But while it counts only one member of Parliament, and its prospects of gaining any more at the next election are extremely doubtful, it draws its voting power mainly from the Liberals; at the last election in Scotland alone it handed over three safe Liberal seats to the Tories; it has nearly done the same in other cases; and it has the will and probably the power to do so again at the next election. Why, it may be asked, should a labor party not act with the Liberals? The formula of the new party is frank socialism. Their object is "the collective ownership and control of the means of production, distribution, and exchange." That, of course, is an object which the Liberal party cannot accept. It is one which the country would not accept either now or at any period, however distant, to which political imagination can project itself. On the other hand, if the detailed programme of the party as distinct from the general formula be examined, containing such items as an eight-hour day, old-age pensions, taxation of unearned income "to extinction," while it contains several points on which Liberals could not go the whole way with them, there is not one in the direction of which Liberals have not been working more or less; and if the men of the new party took their place among Liberals as an extreme wing, in proportion to the force behind them they might get much of their own way. As a hostile force they are powerless except to spite and injure the Liberals and help to give victory to the Conservatives. They affect to despise Conservatism as a played-out force; but that is an error, as they would discover if they were to succeed in placing a Tory government in power for a long term of years.

The socialistic idea on which this new party is based suggests the explanation of such support as its leaders have obtained. With the growth of intelligence and education, the great contrast between the lot of the rich and of the poor—not to be based on any possible standard of merit, and all the more important when the brevity of human life is considered—is more vividly and deeply felt. It is so in all classes, to some extent in all political parties. The question is as to the remedy. Liberals believe that they have moved in the right direction and as fast as they were permitted by their opponents to go, by conferring on the working classes political power, in both imperial and local matters. The Socialists forget that they would be powerless without this instrument, which is hardly cool from the forging, and they reproach the Liberals for not giving them money or money's worth by law—comfort, leisure, all, by state agency. It is forgotten that since the enfranchisement of the working classes was completed, within a very few years, not a little has been done in the direction they desire, all by Liberal effort, some of it by the hand of a Conservative Government, such as free-education, allotment, and small-holdings acts, the poor relieved from taxation, the burdens of the rich increased, improved factory inspection, enhanced wages in Government works. Some of these changes must certainly lead to future development on a larger scale, for example, in the direction of increasing the powers of borough and county municipalities to take and use land. Then there is the important pledge to grant payment of members of Parliament—a measure by no means acceptable to every Liberal, but a good example of the concessions to their own opinions which the more special representatives of labor among Liberals can obtain by influence and argument.

The hostile attitude of the Socialists is probably due in part to the situation of the leaders. As a body they are doubtless as sincere in their convictions, not to say fanatical, as other men. Conscious of this, and in several cases of superior ability, though a few have gained considerable influence, they have not as a rule been taken at their own valuation by the world at large. The party managers have been most anxious to get some specially labor candidates accepted, even though their opinions might be extreme. But they have not been acceptable to the local Liberal committees. They take their revenge by becoming still more extreme and waging war against the party.

The gravamen of the charge of these leaders against the Liberal party is that it pursues political measures to the neglect of social measures. That this reproach is not justified I have already indicated. In fact, political reform was and is the necessary instrument by which social reform can be carried out. But this leads me to another but kindred category of the hindrances which beset the Liberal party. Having recently enfranchised the working classes, it is true that its main object in domestic affairs would naturally be, and in fact is, to attend to those interests of the masses which had been hitherto unrepresented, to watch, to guide, to satisfy consistently with justice the crowding aspirations of the new political force which it has let loose. But it has been the fate of the party that, in some measure from necessity, in some measure from other causes, many of the Liberal measures which have been most in the eye of the public, important as they are, just as they are, have in several cases directly affected only some sharply defined geographical area out of the whole kingdom, or have been mainly promoted by the middle rather than the working class, or in their particular form been likely to divide the working class—in short, did not strike any common chord in which the masses, or the great majority of them, would join. Such questions are the great question of Irish home rule, an imperial question in the highest sense, yet just as clearly a local one; disestablishment in Wales and in Scotland; and liquor legislation. The Socialists say, These be your gods; we want something more substantial. The Tories, of course, say, This is a policy of mere destruction and attacking of interests; we are all in favor of social legislation, which you will not give time for.

The measures I have mentioned have all one difficulty in common. If there be a necessity for a main stream of Liberal policy calculated to benefit directly the laboring masses and insure their support, the leading champions of these various reforms too often have made scant allowance for it. It is their bill and their interest which must take a front place. For the Irish leaders there is the most excuse, and latterly they have shown not the least measure of self-control and forbearance. The minatory language of the Nationalists has often been unbridled enough, but that is now mostly confined to the followers of Mr. Redmond. The Liberal party have taken up the cause, and they will not desert it. The masses of the British people have acknowledged to a most wonderful extent the justice of the Irish claim with unselfish sympathy. Mr. Gladstone tried to win the battle in one year, then in six or seven. It has taken longer. But it is an absolute impossibility, and the most of the Nationalists see it, that the centre of gravity of British politics should be perpetually kept on the other side of St. George's Channel. If it were attempted, the result would be Tory government largely recruited from Liberal votes. Patience and time are necessary.

Disestablishment in Wales and Scotland is also a just claim. The former has long received the unanimous and cordial support of the Liberal party; but that is no reason, but the contrary, why it should be urged on with menace and almost with mutiny. In the same way Scottish disestablishment, a measure which many, perhaps most, of the supporters of the Established Church know is sure to come, has, perhaps, not gained by being included formally in the party programme before it was possible to press it to a conclusion. The prominence of the question at the last election weakened its own supporters, and weakened them greatly at the polls, from Mr. Gladstone downward. It is partly a middle-class question. In many constituencies the workingmen care little about it either way. Yet the lineal descendants of the clerical advisers who compelled Lesley to come down from the hill at Dunbar, when the Lord delivered them into the hand of Cromwell, have always insisted that this question should be put in the very front.

Again, take the liquor traffic. There is no doubt of the expediency of legislation or of the urgency of the problem. It ought, too, to be a workingman's question, and so it is. The pick of the workingmen are deeply interested in it. But the promoters of reform have always taken up a very uncompromising, and their leaders an impatient, attitude. Not only is the publican interest exceedingly powerful, but very drastic and unelastic proposals are apt to excite distrust and opposition among even respectable workingmen—unavowed, perhaps, but finding an outlet in the ballot-box.

The object of all these bills is right, but the zeal which claims for each a first place, though it represents, from one cause or another, only a partial interest, is intemperate and damaging to the party and their own cause, which depend on the party, and on the party alone. Now one great cause of this feverish and menacing impatience is the struggle for parliamentary time; and one great cause of want of time, though not the only cause, is the House of Lords. Here, therefore, is an object of attack on which all promoters of particular measures may agree, and which, moreover, touches the interests, the spirit, the freedom of every citizen of the country. The response to Lord Rosebery's call has not come like a rushing wind. Liberals believe that it will come with increasing volume and harmony. Of his own position with respect to this question and the situation generally, I may take some other opportunity to speak. C. D.

BENJAMIN CONSTANT.

PARIS, January 1, 1895.

SIGNORINA MELEGARI has collected many letters written by Benjamin Constant, and has published his diary, or "Journal Intime," written between the years 1804 and 1816. Constant wrote this diary for his own use, and took the precaution to write it in Greek letters. In 1871 only, M. Adrien de Constant, his cousin, who found this precious manuscript in his archives, transcribed it into Roman letters, but he suppressed some parts of it. The diary was published in instalments in the *International Review* at Rome.

There is another Diary, written before 1804, said to be in the archives of the Constant family, and which may some time be also published; there is even a third *Diarium*, which Constant kept for the eventual publication of his memoirs. Sainte-Beuve cited some notes on this Diarium which Constant gave to his secretary a few days before his death; but Signorina Melegari could find no trace of it anywhere. It is probably lost at present in some collection of autographs. For the period which precedes 1804, we find nothing in the work edited by Signorina Melegari but the letters written by Constant to his family, especially to his mother's sister, Madame de Nassau. It would have been better to follow the chronological order, and to give these letters before the "Journal Intime." As it is, we are obliged to jump back from 1816 to the years of the French Revolution.

Constant's letters are already partly known; some of them have been published from the manuscripts left by Charles de Constant, the cousin-german of Benjamin, to the Public Library of Geneva. The greater number of these were addressed to Madame de Nassau (who was born Chandieu). The new volume gives us also letters addressed to Madame de Charrière, with whom Constant maintained an intimacy for so many years. The letters of Constant to Madame Récamier were published in 1882 by Madame Lenormant, niece of Madame Récamier. As for the letters which Constant wrote to Madame de Staël, they have all been destroyed.

Benjamin Constant was born at Lausanne in 1767; his mother, Henriette de Chandieu, died in giving birth to him. He was brought up, and much spoiled, by his grandmother, Madame de Chandieu, and his aunt, Madame de Nassau. His father was a colonel in the service of Holland; all the noble families of Switzerland furnished officers to the Swiss regiments which served in the States, in France, in Rome, in Naples. It was the misfortune of Benjamin Constant to have had, in a sense, no nationality; to have lived, the greater part of his life—almost all his life—out of his own country. He was neither really Swiss, nor German, nor English, nor French; his horizon was wide, but perhaps too wide; he felt no real duties to any country, and was essentially a cosmopolitan, a citizen of the world. As he had no country, he had no real family; he never knew his mother, he saw little of his father; his aunt Nassau was an amiable friend to him, but nothing more; he was married twice, but never married for love, and he separated from his wives almost immediately after the marriage. His versatile mind, his egotism, never knew the restraint of duty: he felt only the influence of the passion of the hour. His moral nature was never developed, and he was unconscious of his want of morality. He was thrown very early, after short visits to Oxford and Edinburgh, into the midst of the philosophical school of Paris, when the French Revolution was already preparing.

During this first visit to Paris, in 1787, he led the most dissipated life, and made the acquaintance of Madame de Charrière (Miss Van Zuylen, married to a gentleman of the Pays de Vaud, M. de Charrière, who had his country house at Colombier, near Neuchâtel, the author of several novels, all now forgotten). He was twenty years old, she was already forty-seven, but she condescended to become the *marraine* of this *chérubin*, a much more precocious *chérubin* than that of Beaumarchais's "Mariage de Figaro." Benjamin's father, learning at Bois-le-Duc that his son was leading an idle life in Paris, ordered him to join him in Holland, instead of which Benjamin left for England. He consented, however, a little later to accept the post of chamberlain at the little court of Brunswick. There, in 1789, at the age of twenty-two, he agreed to a marriage with a lady-in-waiting of the Duchess Wilhelmine, Baroness of Cram. She was older than he, without any fortune, plain, violent, and quarrelsome. She soon gave him occasion to ask for a divorce.

Constant quickly became disgusted with the court of Brunswick. The Duke was at the head of an army which had entered France; Constant's heart was in reality on the side of the French revolutionists. "Our armies are in France," he writes to the Countess of Nassau (1792). "You must feel, in view of my relations and of the gratitude I owe to the chief of these armies, on which side I ought to be." But he was not really on the side he alludes to; at least, he was uncertain. He deprecates in his letters the 10th of August, the execrable 2d of September, but he has no sympathy for the émigrés. He despises the Girondists, and does not hesitate to call them "les soudoyés des émigrés." He blames Dumouriez; he says that half the French Assembly is sold to the foreigners. But we must read the letter written at this epoch to his aunt, Madame de Nassau, a document which proves how in very troubled times the clearest of minds (for Benjamin had a remarkably clear mind) find it difficult to take the true measure of men and of things.

Constant left Brunswick and returned to Switzerland. On the 17th of September, 1794, he met Madame de Staël for the first time; she was twenty-nine and he was twenty-seven years old. It has been said of Madame de Staël that the world was too small for her fiery soul. Constant was not long in falling under her powerful influence. He accompanied her to Paris in 1795, and, in her salon, became acquainted with Talleyrand, Narbonne, Montmorency, Barante, Jaucourt. He asked for letters of naturalization in France, and bought, not far from Chantilly, the estate of Hérivaux, the westernmost and wildest part of the ancient domain of the Condés. From that moment his life was mixed up with the history of constitutional ideas in France, as he became the champion of the doctrines which Madame de Staël had developed in her great and remarkable book on the French Revolution. The First Consul admitted him to the Tribunate, but when the Tribunate was reduced in numbers, he was excluded with Cabanis and others. The salon of Madame de Staël was not in the movement which prepared the Empire; Napoleon disliked the daughter of M. Necker. When Madame de Staël was exiled, Constant went to live in Weimar; during the summer he joined her at Coppet, on the Lake of Geneva.

The "Journal Intime" begins at Weimar in 1804 (Year xii., 1st Pluviôse). Constant sees Goethe as soon as he arrives. "Shrewdness, vanity, physical irritability even to pain; remarkable mind, fine eyes, face a little worn—such is his portrait." I will make other quotations relating to Goethe:

"I always feel some uneasiness in conversing with Goethe. What a pity he has been led away by the mystical philosophy of Germany. He confessed to me that the bottom of this philosophy was Spinozism. Schelling's mystics have in truth a great idea of Spinoza. But why associate him with religious ideas, and, what is worse, with Catholicism? It is, they say, because Catholicism is more poetical. And Goethe says: 'I would rather that Catholicism should hurt me than not be able to use it in order to make my plays more interesting.' Goethe uses analogy too much; he makes great pretensions in chemistry and in the exact sciences."

Another day, Constant writes:

"Very interesting supper with Goethe. He

is full of wit, of outbursts, of depth, of new ideas; but he is the least *bonhomme* that I know. Speaking of 'Werther,' he said: 'What makes that book dangerous is to have weakness depicted as a force. But when I do a thing which suits me, the consequences do not concern me. If there are mad people for whom this reading is bad, I can't help it.' I know nobody in the world who has as much gayety, *finesse*, strength and breadth of mind as Goethe."

This appreciation of Goethe as a man is more just than the judgment passed on his works: "Read over 'Faust.' It is a mockery of the human species and of all men of science. The Germans find in it an extraordinary depth; as for myself I think it is not as good as 'Candide.' It is quite as immoral and as dry, and it is not so light; there are not so many ingenious pleasantries, and there is much more that is in bad taste."

We find nothing of interest in the Diary on Schiller, who is "too exclusively a poet." Here and there are remarks which are extremely clever, on every possible subject; many portraits also very much alive, such as this: "Madame de S—— is quite of the German sentimental style—pink ribbons, melancholy attitudes, a soft voice, mind a little wandering, susceptibility, bitterness, epigrams, a great sentiment of superiority to her husband. . . . And you think her a desirable woman. . . . Why! it's hell!" He knew much about this sort of hell since he had fallen under the sway of Madame de Staël. "La grande amitié," said Madame de Sévigné, "vit de querelles." Great, indeed, was the friendship (shall we call it love?) which these two extraordinary persons, Constant and Madame, felt for each other. Constant was thinking of her when he wrote this: "The attachment of some women, the empire which they maintain over a man, to everybody's surprise, is like the sleep which overtakes travellers on the Great Saint-Bernard. They are dissatisfied with their situation, but they submit to the sensation of the present, which every moment becomes more difficult to conquer, and death arrives while they intend to depart a moment afterwards." Madame du Deffand said to Pont-de-Veyle: "We have been friends for forty years; don't you think it is because we don't love each other much?" Constant might have said the same to Madame de Staël, after the long years of their acquaintance. He complains incessantly in his diary of his slavery, but he is a willing slave. These two volatile minds, living in a constant hurricane of ideas, were well mated; they were both in a permanent agitation. Madame de Staël was the more manly of the two, the more sincere, the more generous. In 1806 Constant writes: "I received a letter from Madame de Staël. It is the shaking of the universe and the movement of chaos. And still, with all her defects, she is to me superior to everything. I am going to join her at Auxerre." In 1807: "Letter from Madame de Staël. What a fury! O God, deliver us from each other!"

In 1814 a new passion takes the place of the old one. "I spend the evening with Mme. Récamier; and this woman, with whom I lived in Switzerland, whom I have seen on many occasions and in all sorts of ways without her having made any impression on me, suddenly seizes me and inspires me with a violent passion. Am I mad or stupid? But it will pass, I hope." Alas! it did not pass. "Work, literature, politics, all is ended. The reign of Juliette begins." Juliette was flattered by the admiration of Constant, but she did not return his passion. "I have spent a diabolical day. She is a bird, a cloud, without memory, without discrimination, without preference. As her beauty has made her the object of perpetual homages, the romantic language which has always been addressed to her has given her the appearance of a sensibility which is only skin-deep." Mme. Récamier was prudent, and Constant did not deserve any deep and permanent affection. As he was in love, so he was in politics; he attacked Napoleon and then supported him during the Hundred Days. The best that can be said of him is that, on the whole, he was faithful to the cause of liberalism and of constitutional ideas. If he had been born in England, he would have been a Whig. He was thrown into the agitations of the French Revolution, and it is no wonder if sometimes he did not see where his duty lay.

Correspondence.

THE BURNING QUESTION.

To the Editor of The Nation:

Sir: It is evident that the currency is to absorb public attention for some time to come. The papers are full of interviews with bankers and men of business, and the same tone is common to all—that business will revive when the currency question is settled, and hardly before. There is a widespread feeling, at once of shame and anxiety, at the effect of our childish helplessness not only at home, but upon our reputation and financial standing abroad. This feeling finds expression in astonishment and indignation that Congress does not come to some agreement upon a broad basis of public interest.

That which is not understood, and which constitutes the danger of the situation, is that Congress is absolutely incompetent to do this. It is only local private and party interests which are represented there. The nation and the public interest are not represented at all. The House is made up of men selected from 356 equal fractions of the country, the Senate of 88 men from 44 separate States. The first object of every one of them is to see that his district or his State—that is, the most powerful private interests in them—get their full share of whatever is going. No one of them, and nobody else, has any authority or any responsibility to provide for the welfare of the great mass of the nation. The men are not to be blamed for this. They are and do just what the situation calls for, and no government in the world, under the same conditions, could do any differently.

Of all the functions of government there is perhaps none which more deeply involves the moral, social, and physical welfare of a people than the provision of a sound and stable currency. It ought to be settled upon scientific principles with no reference at all to private interests, and the experience of the world in the last century has done much to establish such principles. We leave them entirely out of sight, and hand over the subject to a conflict of private interests. To reverse this, it is necessary that one man and one scheme should be heard and fully considered at a time, and that exclusively from a national point of view. There is but one man in the United States who can meet these requirements, and that man is the Secretary of the Treasury for the time being.

The simplest and most pressing need of the moment is a resolution of Congress declaring positively that the obligations of the United States will be met in gold, and that when the word coin occurs it shall mean gold coin. Why is this not done? Because the interest of party stands before that of the nation, because both parties stand in terror of noisy minorities through the country, and because men of the type of Gorman and Hill, Quay and Wanamaker, Stewart and Bland, can by threats, cajoling, and bribery, direct or indirect, hold back a timid majority from a direct committal. If the Secretary of the Treasury stood by the Speaker's chair, one or half-a-dozen independent members could force him to take a definite stand on behalf of the Government on one side or the other, and the great body of members would be compelled to register their votes for or against him. Can it be possible that any Secretary would propose, or any party majority would vote, a direct negative on such a question? If so, the country had better find it out at the earliest moment.

Meantime there is a perfect tempest of discordant views and opinions pouring over the country like a flood. Nobody who fancies that he knows anything upon the subject will listen to anybody else, and there is no means of distinguishing those who know much from those who know nothing; while the great mass who do not pretend to know anything and are anxious to learn are stunned and dazed by the clatter about their ears.

It may take a great deal of tribulation and disaster yet to teach the lesson, but sooner or later it will be found that the only path out of this Slough of Despond lies in giving a public initiative to the Secretary of the Treasury *ex officio*.

G. B.

Boston, January 12, 1895.

THE TENURE OF POSTMASTERS.

To the Editor of The Nation:

Sir: I saw with great satisfaction the introduction of the bill by the chairman of the Committee on the Reform of the Civil Service, to take postmasters out of politics by making their official tenure one of good behavior—though, I suppose, with a shorter method for determining the end of good behavior than an impeachment before the Senate. I have also seen the remarks of the Hartford *Courant* as reproduced by you, and your answer.

I think, on constitutional grounds, that both the *Courant* and the *Nation* are in error. Congress has the fullest power to prescribe by law the tenure of office for those who may be appointed hereafter; but it has not the constitutional power to strengthen the tenure or to extend the term of any man already appointed. To do so would be equivalent to reappointing him for an additional term. To say by an act of Congress that Mr. Dayton shall keep the New York Post-office after his term expires in 1897, or after the next Republican President's pleasure in him comes to an end, would be such a clear usurpation in the two houses of Congress, who might pass a bill of that sort by a two-thirds vote over the President's veto, that everybody would denounce the attempt as a nullity. For the Constitution has not conferred the power to appoint postmasters on either one or both houses of Congress. An act which should do the same thing, not for Mr. Dayton alone, but for all postmasters, would not on that account be any less unconstitutional.

That all the great constitutional lawyers on the Democratic side did not see this point when the tenure-of-office law in Johnson's days

was passed and vetoed and repassed—that Mr. Evarts and the other defenders of Johnson on the trial of the impeachment did not stumble on it—has nothing to do with the business. The point was to me just as clear in 1868 as it is now; and it needs but to be stated to a lawyer to find a ready assent. The Court of Appeals of Kentucky has passed on it fully in Clark vs. Rogers, 81 Ky. Reports, p. 43.

It follows that only those postmasters would be "tied in" who are appointed after the passage of Mr. De Forest's bill. After the 4th of March the Senate will be Republican, and it will not consent to the appointment of postmasters except where vacancies arise by expiration of term, death, or resignation; and when a Republican President comes in, two years hence, he will have his hands free.

Respectfully, L. N. D.

LOUISVILLE, KY., January 6, 1895.

TAXPAYERS' ASSOCIATIONS.

TO THE EDITOR OF THE NATION:

SIR: Many friends of good government in the East are probably not aware of the effectual efforts being made by the several taxpayers' associations to promote honesty and efficiency in the administration of remote forest towns and counties of the Northwest. The owners of the lands that are unjustly taxed are not philanthropists, but simply professional and business men and capitalists, often non-resident, who cannot longer afford to be robbed by petty local political bosses and machines for their personal ends.

One of these associations, to which I belong, has advised its members to refuse to pay over 40 per cent. of their taxes on lands located in some twenty townships, scattered through six counties in one State. In the case (an extreme one) of one county, their printed circular advises: "Reject everything in this county—State, county, town, highway, school, and all other taxes in every township and city in the county." My attorney writes:

"It is the policy of this association not to fight taxes merely on pure technical defects, but only in case of excessive and unjust taxation, and in such cases to use any technical defect that could be found. Every year the township treasurers seem to be chosen from a more ignorant class of people."

Every year, too, more and more tax is contested in the courts, and the association generally wins. The inevitable result will be that the inhabitants of this region will find it *will pay* to elect intelligent men of character to office instead of the ignorant and dishonest, just as New York city has found out. All this points towards the one certain cure for bad government. When men of property find that they can save more money by working for good government than they can make by following ordinary business, they will become practical, efficient reformers, working through some form of good-government organization, spending their money and time, just as myself and friends are now doing; some of us not having found so useful a field (save in independent voting) before. T. B. B.

BAINBRIDGE, GA., January 8, 1895.

THE CYCLOPÆDIA OF CHRISTIAN BIOGRAPHY.

TO THE EDITOR OF THE NATION:

SIR: A few days ago we received a letter from one of the Anglican bishops in the United States, enclosing a circular which had been sent to him, and which contained an announcement of a 'Cyclopædia of Christian Biography, etc., etc., edited by William Smith, D.C.L., and Henry Wace, D.D.,' and asking if this work was issued with our consent.

If it were not so issued, the bishop assured us that he, in common with some other Americans, would perfer to have nothing to do with it. At the same time he suggested some communication of the facts of the case to you, sir, who took a leading part in setting before the public the true story of the American edition of the 'Encyclopædia Britannica.'

I am not personally acquainted with the bishop, but I deeply appreciate his kind and courteous consideration of our interests, and propose to adopt his advice by laying the case before you.

The 'Cyclopædia [or, as we call it, the Dictionary] of Christian Biography' is, as I dare say you are aware, one of the great series of dictionaries originated and carried out by the late Sir William Smith and my father. It covered a field up to that time unoccupied, and was written by some of the leading scholars of the day. After ten years of preliminary labor, the first volume was published in 1876; the fourth and concluding volume appeared in 1887.

It is needless to add that the work was a very costly one to produce (having cost us £16,000), and one, moreover, for which we could only anticipate a very slow sale. At the present moment we are some £3,000 or £4,000 out of pocket by the undertaking.

Since its first appearance the work has been brought out in the States by Messrs. Little & Brown in conjunction with ourselves.

In December, 1891, Messrs. Little & Brown communicated to us a proposal, which had been made to them by "the publishers of a religious magazine," that we should supply to those publishers (whose name was not at the time communicated to us) a special edition of our work; "but," added Messrs. Little & Brown, "the price would have to be very low; it is quite possible, therefore, that it may not be in your power to entertain" the proposal. Sir William Smith was then alive, and after consultation with him, and careful calculation, we found that it literally was not in our power to comply with this proposal on the terms suggested, and we accordingly declined it, preferring to continue our association with Messrs. Little & Brown.

In March, 1894, Dr. Wace received a letter from a Mr. Dagley, writing on behalf of the Christian Literature Company, New York, announcing that a new edition of the 'Dictionary of Christian Biography' was about to appear, asking him to undertake something "in the nature of a revision which would not require more than a few months," and pointing out that such a new edition "would not operate to 'his' disadvantage, and in fact we believe we could make it a source of quite some revenue to you," etc. Dr. Wace, I need hardly add, promptly informed us of this offer, and as promptly declined to have anything to do with it.

The Christian Literature Company write that "the original edition has been on the market long enough, so that the sale of it here is practically completed." At the same time in their prospectus they pay us the compliment of alluding to "this monumental work, without a rival, and indispensable to every historical student."

Now, sir, I am perfectly well aware that we have no claim for redress in this matter; indeed, some thanks may be due to the undertakers of this enterprise for having consulted us at all (for I understand that the original application to us and the present prospectus practically emanate from the same quarter) where they were free to appropriate all the fruits of our labor and outlay; but I am encouraged by the kind words of the bishop to lay the facts before you in case you may consider them worthy of publication, for public opinion is the only tribunal to which we can appeal. I blame no individuals; I only mention the foregoing facts as one out of many examples of the hardships incurred under the existing state of our international-copyright relations.

JOHN MURRAY.

LONDON, January 4, 1895.

THE *SPECTATOR* ON THINGS AMERICAN.

TO THE EDITOR OF THE NATION:

SIR: Let me call attention to two delicious bits from the London *Spectator* of December 29, 1894. (The italics are mine.)

In the first editorial article: "The Chinese Government still talks of negotiation, and has taken the very odd step of asking the American President to send them a statesman to advise the ambassador they are sending to Tokio. *Mr. Cleveland has accordingly selected a Mr. Foster.*"

Again, a very eulogistic review of Mr. Scudder's 'Childhood in Art and Literature' ends thus:

We will conclude with a specimen of the humour which Americans *can put into their gravest state documents:*

"The sixteenth amendment to the Constitution reads: 'The rights and caprices of children in the United States shall not be denied or abridged on account of age, sex, or formal condition of tutelage,' and this amendment has been recognized in literature, as in life, while waiting its legal adoption."

Save me from my friends, may Mr. Scudder say.

The same criticism quotes Dr. Johnson as saying of Goldsmith, "Nihil tetigit quod non ornavit"—which he didn't.

WILLIAM EVERETT.

WASHINGTON, D. C., January 8, 1895.

THE NEED OF A NEW REVIEW.

TO THE EDITOR OF THE NATION:

SIR: Kindly grant me the space for a few words upon a subject often discussed in private, but not, so far as I know, in your columns. Earnest men who can recall the *Princeton* and old *North American* have not ceased to regret the death of the former, and the worse fate that has befallen its scholarly rival. The *Yale Review* is pretty rigidly limited to the results of original research in history and economics. Nearly the same is true of the other specialists' organs. There is no one of the great monthlies which has for its main purpose any higher result than the diversion of its popular audience of, say, from fifty thousand to half a million readers. The *Forum*, indeed, apparently gives perfect freedom of utterance to the most competent and fearless voice available; but its limitations as to space are imperative, it usually touches only topics already in general debate, and its contributions are nearly all "requested" by the editor.

There are, without doubt, a large number of papers, by competent and even graceful hands, lying in academic or other desks at this moment, which ought to be available for a thousand colleagues, and for ten thousand or more

advanced—or at least mature and earnest—students, scattered throughout the country. There is a healthful reaction setting in here, and quite as much in Germany itself, against excessively narrow special research, and particularly against the delivery of its results in undigested and uncorrelated form. More and more it is recognized that the specialist has not justified even his research adequately until he has stated his chief discoveries in terms intelligible to a wide audience, and, above all, has made clear how his report modifies the mass of seemingly settled and generally accepted truth.

The periodical many of us have vaguely in mind would cover, in a sense, the whole wide field of history and literature, with open paths toward ethics, sociology, and at least some applications of many sciences. There is a widespread and growing feeling of the essential unity, the *commune vinculum*, among such studies. Are not the times ripe for a publication which would stand, not for the theoretical discussion of any such educational harmony, but, perhaps, for its concrete illustration?

There was a rumor, seemingly baseless, "a year and more agone," that the stalwart young university in Chicago contemplated such a publication. Should it not rather be upheld by a large editorial committee representing all the leading centres of the highest education? Such names as C. E. Norton, N. S. Shaler, John Fiske naturally occur to a Harvard man in such a connection, but every Sparta has no doubt equally worthy sons. Certainly the application of the best results drawn from studies in history, literature, and elsewhere, to the obsolescent art of simple living and high thinking is not an unworthy nor dilettanteish ideal for a university publication. The motto might be taken from Emerson: "How to give all access to the masterpieces of art and literature, is the problem of civilization."

I am, very cordially yours,

WILLIAM CRANSTON LAWTON.

PHILADELPHIA, January 7, 1895.

THE INTERNATIONAL POSTAGE-STAMP.

TO THE EDITOR OF THE NATION:

SIR: Your correspondents who are urging an international postage-stamp seem to have made no provision for the difference in exchange between different countries; so that if such a stamp were issued, it would be sold by that State which used the most debased currency.

For example, if I were to mail a letter from El Paso to England, it would cost 5c. United States currency, while in C. Juarez, on the other side of the river, I could nearly buy two 5c. stamps with my 5c. of American money. Americans would also find it to their advantage to buy their stamps in England on a basis of $4.80=£1, since the 2½d. stamp is used as equivalent to the American 5c.

Yours respectfully, SINESTAMPS.

SAN FRANCISCO, CAL., January 8, 1895.

A CORRECTION.

TO THE EDITOR OF THE NATION:

SIR: In your review of the book, 'A Run through Russia,' of August 23, 1894, I desire to call your attention to two mistakes. Your reviewer says: "On page 87 he ranks John the Baptist, Tolstoi, George Fox, William Penn, and Christ as equal gods." What is said is as follows: "Count Leo Tolstoi shows the power once more in the world's history of the principle of renunciation, as Buddha showed it in India, and the divine founder of Christianity showed it in Galilee"—which is a very different statement from that of the reviewer.

Again, your critic says: "They shared in the afternoon tea of a court lady's reception, evidently mistaking it for a lunch given for them, since it was so stated." As a matter of fact it was no afternoon tea at all, but a special lunch for the two visitors, to which they were invited by letter—with no other guests present, as can be verified by the rest of the party.

Other matters of lesser import are passed over, in the hope that you will do me the justice to correct these statements, which are calculated to injure the writer in the eye of the public.—Very respectfully yours,

WM. WILBERFORCE NEWTON.

[Though Dr. Newton trims his quotation at the beginning and at the end so as to leave out John the Baptist, George Fox, and William Penn, we think our phraseology was too loose in this instance, and open to objection.

As regards the other matter, we had to depend entirely upon what we found in his book. On p. 37 he states that he and his friend called upon Countess K. "on a Friday evening," and received "a delightful cup of tea from the smoking samovar."

"Upon inquiring when we could best see Countess Tolstoi, our hostess remarked to Madame Novikoff, 'Let me see; the Emperor came up from Gatchina the day before yesterday—well, there will be lunch at one o'clock to-morrow—but by three you will find the Countess disengaged.' . . . We failed to receive an invitation to meet the Czar. . . . On the following day we paid our respects to the Countess Tolstoi at the Winter Palace. . . . The ubiquitous samovar upon the table furnished us our indispensable cup of tea. . . . Another elegance in blue daisies and white stockings, similar to the gentleman already described at the Marble Palace, served us at lunch."

No Russian eats luncheon at three o'clock P. M., the hour at which Dr. Newton tells us, in effect, that he called on Countess Tolstoi. They lunch between eleven A. M. and one P. M., and do not use the samovar for that meal. If the Countess Tolstoi had been present at the Emperor's luncheon, as Countess K. had intimated on the preceding evening that she would be, it is plain that Dr. Newton mistook afternoon tea for luncheon. We now for the first time hear of a letter of invitation from Countess Tolstoi, which was hardly suggested by the phrase "paid our respects." The hour is still unnamed. —ED. NATION.]

Notes.

HENRY HOLT & CO.'s January announcements include 'A History of the Novel previous to the Nineteenth Century,' by Prof. F. M. Warren of Adelbert College; Nevinson's 'Slum Stories of London (Neighbors of Ours)'; a translation of Kalidasa's 'Sakuntala,' by Prof. A. H. Edgren of the University of Nebraska; 'Deutsche Gedichte,' an inexpensive collection of German poems, edited by Dr. Camillo von Klenze of Chicago University; and 'Classic French Letters,' edited by Prof. E. L. Walter of the University of Michigan.

Macmillan & Co. have in preparation a volume on Aristotle's 'Theory of Poetry and Fine Art,' by Prof. Butcher of Edinburgh.

'Philosophy of the Mind,' by Prof. George T. Ladd; 'Reminiscences,' by George Augustus Sala; and a revised edition of the late Prof. Austin Phelps's 'English Style in Public Discourse' are just leaving the press of Charles Scribner's Sons.

D. C. Heath & Co. will publish 'The School Poetry Book,' by James H. Penniman, edited with a kind of logical arrangement and for the encouragement of memorizing.

Mrs. Annie Besant's Autobiography is to be published in this country by Henry Altemus, Philadelphia.

Another volume of the *Bookworm*, "an illustrated treasury of old-time literature," comes to us from A. C. Armstrong & Son. It is hard to describe the contents of this undated periodical, in which one may look to stumble upon anything pertaining to literature, as, in the present instance, a list of books ordered of an English firm, in 1771, by the Chevalier d'Éon, a recent black-letter find dissected from an old binding, a discussion of the identity of Junius, etc.

Four more charming little volumes of the "Temple Shakspere" (Dent-Macmillan) have come to hand, viz., "All's Well that Ends Well," "Twelfth Night," "King John," and "A Winter's Tale." They will, like their predecessors, quickly find their way into the pocket.

Munson's Phonographic Dictionary, in which the various strokes are indicated by Roman letters, is now a work of relatively long standing. It is, of course, adapted to the author's system. We have just received from the Phonographic Institute Co. of Cincinnati Part I. (A—Breathlessly) of 'The Phonographic Dictionary and Phrase-book,' conforming to the so-called "American system of shorthand." The compilers are Benn Pitman and Jerome B. Howard. Here we have the phonetic outlines themselves clearly delineated over against the corresponding words. This is ingeniously effected by making groups of three words, thus securing the necessary depth for the outlines, which, by the way, are fully vocalized; and position is indicated when necessary. The typographic difficulties of a work like this seem to us to have been remarkably well overcome, and the dictionary cannot fail to give a great impetus to the study of shorthand.

A tradition, probably dating back to the days of "Left-legged" Jacob Tonson, and still surviving as a time-honored joke, even in the pages of Thackeray and Rider Haggard, represents the publisher as the natural enemy of the author, the parasite created and equipped especially to batten on his brains. Nowadays better conditions prevail: the publisher is usually a man of culture and refinement; sometimes a scholar; occasionally an author. Such a publisher was Mr. Fields, who honored himself and his calling by the justice and generosity of his dealings with literary men, and who was the personal friend of many of the best writers of his day. These friendships he perpetuated in a most interesting collection of annotated books, autographs, portraits, and other relics dear to the book-lover; and these Mrs. Fields has taken for the groundwork of a group of pleasant papers, full of anecdotes and personal recollections of the literary men of the last generation, and copiously illustrated ('A Shelf of Old Books,' Scribners). The bibliophile who, opening it at random, lights on a facsimile letter from Lamb, De Quincey, or Hunt, will find it no easy book to lay down.

About a third of the volume is devoted to Leigh Hunt, to whom both Mr. and Mrs. Fields seem to have been peculiarly attracted; and it is clear that, with all the foibles of the man, some of which were irritating enough, he possessed a singular power of fascination. Around Hunt are grouped anecdotes of Keats, Shelley, Severn, and others of that circle. The chapter on Edinburgh introduces us to Scott, De Quincey, Wilson, Dr. John Brown, the brothers Chambers, and other men of note; and the last chapter, "From Milton to Thackeray," is an entertaining *olla podrida* of literary anecdotes agreeably told.

The character of the papers which make up Sir Edward Strachey's 'Talk at a Country House' (Houghton, Mifflin & Co.) presupposes more leisure and less critical shrewdness than the reader of the day is in general possessed of. Their appearance from time to time in the *Atlantic* has already made familiar the model of conversational complaisance they offer, through a form of dialogue in which each participant is always of one mind with the other, and exhibits exemplary patience at the other's quotations of poetry. Most of the opinions expressed are such as our fathers have declared unto us in the old time as safe and blameless to hold, and the volume is one which may without reserve be recommended to any whom time ambles withal, and who have a fancy for seeing turned over the liberal stores of a mind that includes a knowledge of Persian Poetry and Arrow-headed Inscriptions, together with views on Love and Marriage, a General Election, and Maurice and Tennyson, and which raises no question that is not easily laid in the pleasant setting of a Somersetshire manor house.

'Notes on Tobogganing,' by Theodore Andrea Cook (Scribners), will be found very interesting by American visitors to St. Moritz who indulge in that exhilarating amusement. The illustrations, from instantaneous photographs, are excellent, and give a most accurate idea of the difficulties that beset the bold rider whose ambition prompts him to try for a "record" on the celebrated Cresta run. Mr. Cook has followed the local custom in calling the sport tobogganing, though this is, in fact, a misnomer. It is true "coasting," which differs from tobogganing firstly in that it calls for the use of a sled with steel runners and quite unlike the Canadian toboggan, and secondly in that it is performed on a crooked run, and therefore necessitates much skill in the matter of steering. Mr. Cook is evidently of the opinion that the sport as developed at St. Moritz is a new discovery; but the boys of any village in the hilly part of New England could demonstrate the fallacy of this notion.

It is always a pleasure to come upon a book bearing the name of so penetrating and so impartial a critic as M Émile Faguet. As editor-in-chief of the "Classiques populaires," published by Lecène, Oudin & Cie., he has shown admirable judgment in the selection both of the classical authors and of the writers intrusted with the task of presenting them anew to the public in a popular form. One of the early issues, the volume on La Fontaine, was from his pen, and, it must be confessed, not up to his usual high standard. He was evidently trying to write in genuine popular fashion, and he is altogether too earnest for that sort of work. His new volume, 'Voltaire,' is in his real manner, and infinitely more "popular," in the best sense of the word, than the other. It is a study of the great eighteenth-century writer which one reads with unflagging interest. Well constructed, well written, plentifully illustrated by well-selected and not always hackneyed extracts from the matchless prose and easy verse of Voltaire, the book is at once a valuable addition to Voltairian literature and a capital number of the deservedly popular collection to which it belongs.

For the same series M. Léo Claretie, whose exhaustive work on the origins of Lesage's 'Gil Blas' is well known, has written an excellent volume on Lesage. In it he speaks not of the great novel alone, but of the varied and powerful dramatic work which includes "Turcaret" and the brilliant "Théâtre de la foire," and of the other novels of Lesage, such as 'Le Diable boiteux,' 'Guzman,' and 'Le Bachelier de Salamanque.' The analyses of the different works are fully illustrated by copious and well-selected extracts, so that a good and comprehensive view of the writer's productions is had, with a clear summing up of Lesage's qualities and defects, the share he took in the evolution of the novel, and the place he occupies in French literature. Within its limits the book is one of the very best yet written about Lesage.

Still another contributor is M. Paul Morillot, who has had the good fortune to speak of André Chénier in moderate and impartial fashion. André Chénier is usually, nowadays, regarded as the representative, at one and the same time, of the purest art of antiquity and of the coming Romantic School. M. Morillot does not favor this view, and applies himself with marked success to the destruction of the legendary Chénier, whom he seeks to replace by a truer representation of the man drawn from a critical study of his works. Haraszti's book, which deservedly attracted much attention on its publication, was an effort in this direction, and M. Morillot has benefited by the labors of the Hungarian critic. His own examination of the poet's work, his independent and fearless judgment of it, make his book a valuable contribution to the knowledge of the real Chénier.

We take leave for the moment of the "Classiques populaires" by mentioning the 'Alfred de Musset' of M. A. Claveau, and the 'Béranger' of M. C. Causeret. The former is decidedly the fuller and better biography, being a good account of Musset's life and work, with analyses of his principal poems, plays, and tales. The secret of Musset's charm and his real position towards the Romantic school are brought out with sufficient distinctness, and the essential difference in the quality and inspiration of his verse before and after Venice is successfully shown. M. Causeret has displayed no less patience and energy in endeavoring to interest the present generation in Béranger, but he cannot be said to score a success. M. Francisque Sarcey hit off the only true way to resuscitate the song-writer, and that is to sing his songs, not to read them or talk about them. What survives of Béranger is very little indeed, and the most valiant efforts of his admirers must fail to give him a high place among poets. Songs that need a long commentary and a tedious historico-political introduction for their comprehension will sooner or later be neglected save by the antiquarian.

Within the last few years we have noticed two handbooks for the study of Dante by Dr. G. A. Scartazzini, the well-known editor of the "Divine Comedy"—his 'Prolegomeni' (1890) and his 'Dante-Handbuch' (1892), the latter of which has been translated into English by Mr. A. F. Butler, under the title of 'A Companion to Dante' (1893). The indefatigable compiler has now turned his attention to his much earlier work of the same character, the little two-volume 'Dante' in the Hoepli series of popular manuals (1883), translated into English by Dr. Thomas Davidson in 1887. This manual Dr. Scartazzini has thoroughly revised, increasing the matter by a third, and has published under the new title of 'Dantologia: Vita ed Opere di Dante Alighieri' (Milan: Hoepli). The contents are not greatly different from those of the preceding books, but the treatment is more concise, the make-up of the little volume excellent, and the matter, especially the bibliographies, well up to date.

The Boston Public Library has put forth a remarkable 'Catalogue of the Books relating to Architecture, Construction and Decoration' on its shelves November 1, 1894. Its value will appear from a mere examination of the contents: Bibliography, Biography, Dictionaries, History and Theory, Periodicals, Periods and Styles, Architecture of Countries (geographically ordered), Illustrations of Architecture (as amphitheatres, asylums, fountains, prisons, railroad stations, schools, etc.), Architectural Details (limited to four topics), Technical Details (including drawing, construction, and decoration in its several branches), Handbooks (including estimates, formulæ, and specifications), Building Laws (with contracts, etc.). These classes are followed by indexes (1) of authors, (2) of places and subjects. The building fraternity and the public owe this intelligent labor to a woman.

The first number of the new series of *Science* contains a double introduction, by Prof. Newcomb and by President Gilman, setting forth the aims of the paper under its changed management. Prof. Brinton contributes his address as president of the American Association, and Dr. Goode, director of the United States National Museum, his address as president of the Washington Philosophical Society. There are more technical articles by Major Powell on modern aspects of ethnology and anthropology; by President Mendenhall of the Worcester Polytechnic Institute on the action taken by the electricians of the world recently assembled at Chicago in defining electrical units, and by Congress in legalizing these; and by Dr. C. Hart Merriam and Prof. Scudder, the first editor of *Science*, on zoölogical subjects. The book reviews are signed by Profs. Woodward, Packer, Conn, Brinton, and Britton, and the number ends with notes and news of societies, journals, and books. The print is open, but this cannot long be the case if the paper prospers, as we must hope. The strength of the "editorial committee" is its weakness, as every journalist knows; and this body should in time yield to a single control. Not a member of it can expect candid criticism of his own work in signed reviews in his own paper. The responsible editor is Prof. J. McKeen Cattell, Garrison-on-Hudson, N. Y. The publisher's address is 41 East Forty-ninth Street, New York.

The latest number of the *National Geographic Magazine* has an interesting note, by Prof. I. C. Russell of the University of Michigan, concerning the altitude of Mt. St. Elias, towards whose summit he has made a nearer approach than any other man. The peak is capped with a sharp pyramid of snow, built by the winds and of variable height with storms, seasons, and years. The depth of the snow is estimated at not less than 200 feet, and possibly as much as 300 or 400 feet. The height of the summit may therefore be expected to vary by a decidedly greater amount than the error of its measurement by good trigonometrical work. The same number of

the magazine announces that a gold medal is offered by the National Geographic Society for the best essay, not exceeding two thousand words, on the River Systems of the United States, written under certain conditions by scholars in our public schools and submitted to the Society not later than July 15, 1895. Full details of the competition may be obtained on addressing the secretary of the Society in Washington. A new series of monographs is also planned on the physical features of the United States, to be prepared by various expert authors, expressed in untechnical language, well illustrated, and addressed to the teachers of our public schools. If successfully carried out, this project bids fair to exercise an important influence on the teaching of geography in our country.

A succinct and clear presentation of the architectural development of the Greek stage, according to the "neue Lehre," is given by Dörpfeld in the *Berliner Philologische Wochenschrift* for December 22, 1894, reviewing two essays on the Greek Theatre by K. Dumont, published as the first volume of a series of "Études d'art grec" (Paris: E. Leroux). Dörpfeld disposes of Dumont with the impact of a trip-hammer, retracts his former opinion that *Theologeion* should be substituted for *Logeion* in Vitruvius, since a Delian inscription discovered by the French has shown that Vitruvius's use of the word is correct, and proceeds to point out the small but pregnant error of the Vitruvian account. Dörpfeld's long-promised work on the Theatre of Dionysos in Athens he hopes to bring out this winter. All students of the Greek theatre and drama will welcome its appearance.

The *Débats* of December 23, 1894, notes the fact that a crisis has overtaken wood-engraving in France like that which the art has been passing through here. "Process" (*procédés originaux*) is at the bottom of the trouble there as here, but the French engravers complain also of excessive augmentation of their ranks from the schools and ateliers and from foreign countries. It is estimated that one-fifth of the 500 engravers in Paris are non-French. Hence a movement of "protection" for the craft by limiting the number of apprentices and excluding foreigners altogether from instruction.

Among the Hans Sachs literature of the past year is a portfolio of facsimiles of prints of old Nuremberg, with particular reference to the three R's of that famous city—"Rathaus, Regiment, und Rat" (Nürnberg: Heerdegen-Barbeck; New York: Westermann). The fourteen plates are described in eight pages of letterpress. The Rathaus is shown in a great variety of views, external and internal, in connection with ceremonies and public rejoicings, as over the peace of 1649, when the multitude caught in their hats the streams of wine issuing from the Swedish lion in one of the win dows. The peace congress itself is pictured, with a key to the personages. The "Regiment" is reflected in the torture-chamber, in public punishments, and in the carting of adulterated wine to the ill-smelling Pegnitz. A series of patrician portraits closes this very curious collection.

A chapter might be written on the success of the late Rev. Dr. John Lord as a lecturer on history, but we content ourselves here with notifying his numerous auditors and admirers all over the country that Mr. F. Gutekunst, Philadelphia, has admitted him to his "Imperial panel" portrait gallery.

A correspondent calls our attention to an obvious slip in our issue of January 3, whereby the Episcopal Church was credited with holding to three sacraments, instead of two.

—A well-printed pamphlet of twenty-six pages has been published "for the history classes of the Providence High School," which is worthy of wider circulation. The most elaborated list of historical novels, dramas, etc., ever made is that of the Boston Public Library, which for two years has been publishing serially. But this contains so much matter (titles in foreign languages of long-forgotten plays, etc.) which is of interest only to the advanced student of literature that it is unusable by the general reader. The Providence list is arranged chronologically under countries, and, though not free from errors, can be commended as the best known to us for common use. We note that while the unfamiliar "C. M. Mundt" is substituted in the author-list for the familiar Luise Mühlbach, "G. Samarow" is printed instead of the author's real name, Oskar Meding. The "Miss Lynn," author of 'Amymone,' is known to this generation as Eliza (Lynn) Linton. Curiously enough, we find mentioned no book relating to Italian history between the seventh and the fourteenth centuries, the period of Frederic Barbarossa and of Guelph and Ghibelline. From the absence of books relating to the history of the United States and Canada we infer that American history is not studied at the Providence High School. The misprints are so numerous as to lead one to doubt whether the proof was read at all.

—In this connection we may mention Mr. George Saintsbury's three articles on Historical Novels in *Macmillan's* for August, September, and October. Mr. Saintsbury's views are more remarkable for the reflection of what we suppose is the common British opinion than for that critical insight which enables us to see things in a new light—to get new pleasure from increased vividness of perception; but they do not, we think, always coincide with the best critical opinion. To all intents and purposes the historical novel, he says, was invented by Scott, since, previous to the appearance of 'Waverley,' though novels dealing with persons and events of the past were not unknown, their history and archæology were conventional, while their fiction was generally unreadable. Next to Scott, Dumas is the most important worker in this field, and after him, each for two novels, Thackeray and Charles Kingsley. It is not, however, 'Hypatia' (which most people would hold to be Kingsley's most successful effort) but 'Westward Ho!' which is held up for admiration. 'Romola,' which one would expect to find in any list of great novels, is barely mentioned, 'The Cloister and the Hearth' is not named at all, and even 'The Scarlet Letter' is ignored, though it fulfils the first (and most rarely realized) condition of good work in this department—that of reproducing not the "own words" of some historic character, but the very atmosphere of the time described. Our British critic, indeed, with the natural preference for mediocre works of home production to the best articles of foreign make, fails even to name two great triumphs of German authors—works which number their native readers by the million, and are widely known in English translations—Hauff's 'Lichtenstein' and Scheffel's 'Ekkehard.' He evidently prefers, since he mentions having read the greater part, if not all, of their works, such masters as G. P. R. James and W. H. Ainsworth; even Marryat and Lever are discussed at some length—to the exclusion of all Americans except Cooper. Yet, besides Hawthorne, at least five American novelists of this class have been widely read in other countries—Judge Thompson, the author of 'The Green Mountain Boys'; J. H. Ingraham, whose tasteless fictions have been read by as many thousands of orthodox people as, in our time, it has been the good fortune of Gen. Wallace to attract; and the author of 'Zenobia' and 'Julian.' We have no means of knowing whether Mr. Saintsbury fails to mention these because he never heard of them, or because, with the exception of the first-named, their books fall under what he calls "the curious curse which seems to rest on the classical novel."

—The late Prof. Ramsay's 'Manual of Roman Antiquities,' now in its fifteenth edition (New York: Scribners), is as welcome as ever, although in execution its present form is strangely uneven. The first chapter, on the topography of Rome, has been all but rewritten by Prof. Lanciani, and it is illustrated with several new plates and with two new plans, one of the city (signed by Lanciani himself) and the other of the Forum. It would be difficult to find anywhere a more succinct and at the same time accurate treatment of this topic. Lanciani, moreover, is here not merely repeating what he has said before; he has carefully revised some of the views which he put forth too hastily in former works—as, for example, his earlier theory about the origin of the Monte Testaccio. But the remaining fourteen chapters have not undergone the same careful overhauling. They are reprinted as they stood before, and apparently by some "process," so that the type differs in an ugly way from that used in the first chapter. The editor, Dr. T. E. Charles, seems to imagine that the progress in the study of Roman antiquities has not been such as to call for a thorough revision of the body of the book, and he has therefore contented himself with printing at the end of each chapter a list of references to the most recent authorities on the subjects treated therein. This list forms, indeed, a handy bibliography; but, citing only foreign works, as it does almost entirely, it will hardly be of much practical use to the sort of students for whom the book is primarily intended. To these, then, all but the first chapter remains what it was; but even so, and in spite of numerous errors, the book will continue to perform its task fairly well. In political and legal antiquities it still remains almost the only English book in its field; but in the department of private life there are far better works to be had. We can say nothing in praise of the illustrations. Execution (in general poor enough) apart, and aside from the fact that the sources are rarely given, it is pretty hard on Lanciani that the list of illustrations should make him seem to give the name "Temple of Vesta" to the round temple of Mater Matuta; and we had hoped that we had seen the last of the decrepit old imposition called a "wall-painting from the baths of Titus."

—The intellectual world generally, not less than scientists, will be interested in the elaborate memoir of Dr. Eugene Dubois, of the Dutch East Indian army, on the remains of a preëminently hominine anthropoid which were recently discovered in the Post-Pliocene (or late Pliocene?) deposits of the island of Java. If the premises in the case have been well taken—and there is no special reason to doubt that they were—then seemingly in this discove-

ry we have the actual substance of the "missing link" itself. The remains in question consist of the roof of the skull, the femur, and a molar tooth of a mammalian which was of approximately the size of man, but whose affinities were largely with the apes, as is proved by the general cranial conformation and by certain simian characteristics of the thigh-bone. On the other hand, the cranial arch is surprisingly pronounced, falling almost half-way between that of the chimpanzee and that of man, while the cranial capacity actually approaches the "physiological minimum" in man, and is double that of the gorilla! The thigh-bone is in form and dimensions the absolute analogue of that of man, and, in the opinion of the author, gives unmistakable evidence of having supported an habitually erect body. To this remarkable "manlike transition form" (*menschenähnliche Uebergangsform*) Dr. Dubois gives the name of *Pithecanthropus erectus*, using the generic designation which Prof. Haeckel applied in 1868 to a hypothetical form to be discovered, and which now comes in with special appropriateness. The nearest ally to *Pithecanthropus* appears to have been the large chimpanzoid *Anthropopithecus Sivalensis*, from the Siwalik deposits of India, which, indeed, may be ancestral to this newly discovered form and to the African chimpanzee as well. Dr. Dubois unhesitatingly places the extinct Javan ape as the intermediate form between man and the true anthropoid apes, and the order of development (evolution) which he assumes to have been most likely is: *Prothylobates*, *Anthropopithecus Sivalensis*, *Pithecanthropus erectus*, *Homo sapiens*. This view is largely at variance with that held by some of the American palæontologists, who look to a lemurine ancestry for man.

—The richness of the South African gold-fields seems to have been underestimated even by the optimists. A work has just appeared from the pen of Dr. Karl Futterer, 'Afrika in seiner Bedeutung für die Goldproduktion in Vergangenheit, Gegenwart, und Zukunft' (Berlin: Reimer), which contains some very interesting data regarding the possible gold-production of the Dark Continent. At the present time the gold-mining activity is nearly all concentrated in the region of the Transvaal, whence in 1893 there was obtained a product the valuation of which was placed at upwards of $29,000,000. Barely more than one-thirtieth as much was obtained from all the rest of the continent put together, although at various times the northeast and northwest have yielded heavily in the metal, and, if we are to believe a statement of Diodorus, the Egyptian kings alone mined gold to the amount of $30,000,000. The total African yield up to the present day is roughly estimated to be 1,235,500,000 marks (approximately $300,000,000), of which 400,000,000 were drawn from northeast Africa, 600,000,000 from the northwestern region, and 235,500,000 from the equatorial and southern parts of the continent. Dr. Futterer takes a much more hopeful view of the gold situation than Prof. Suess, and believes that we have an as yet almost untouched resource in Africa. He follows Schmeisser in the opinion that for many years to come the value of the gold output will be largely on the increase, and assumes that from the Witwatersrand gold-fields alone the yield in twenty-five years will be $1,000,000,000; at the end of that time it is conjectured that the mining operations will be conducted at a depth of half a mile. Naturally, no absolute dependence can be placed on such estimates of the possibilities of the gold-bearing conglomerates, but Dr. Futterer properly emphasizes the importance, in placer operations, of ancient (or fossil) as well as modern washes, and how extensive these may be we do not yet know.

THE ORIENT IN FRANCE.

The Deserts of Southern France: An Introduction to the Limestone and Chalk Plateaux of Ancient Aquitaine. By S. Baring-Gould, M.A. Illustrated by S. Hutton and F. D. Bedford. Dodd, Mead & Co. 1894. 2 vols, pp. xxii, 296; xii, 303.

THE world is long in awakening to the fact that there is an Orient in the Occident; that we need not go to Egypt for desolate gorges and ranges, nor to the Ægean for mountains knee-deep in the sea, nor to Tangiers for pointed arches and Moorish patios, nor to Italy for Magna Græcia, nor to Palestine for Tyrian strongholds. Why did the Phœnicians prowl about the northern coast of the western Mediterranean, and the Greeks send colonies thither, and the Saracens invade the interior, but that they found their own country over again? Northern France is a mediæval land, the realm of Charlemagne, and the prey of Rollo the Norman; it is fiercely western and northern. Provence and Languedoc are not even a Latin country, notwithstanding the noble Roman monuments; the scenery, the people, and much of the history are Oriental. Whoever loves the Apennines and the snowy ranges of the Peloponnesus and the olive groves of Corfu, will find himself in all those places of delight when he visits Southern France.

Of the many strange and beautiful regions in this ancient land, none are so little visited or known as those great table-lands, the Causses, which Mr. Baring-Gould stigmatizes as "deserts." The word suggests the "Great American Desert," which disappeared from the geographies thirty years ago and never has been recovered. Languedoc is a desert as Attica is a desert, the great white-caps of mountains rolling up out of green luxuriance. It is a desert as Sicily is a desert: wherever the hot sun plays upon the naked rock there is an Asiatic glare, but where it strikes a watered valley or plain, there lies the full, grateful, and abounding soil of African oases. It is a region not like the gloomy gorges of Roncesvalles further south, where Roland sounded his defiant horn; the uplands have the charm of their own undulation, like a heavy sea turned to stone, and the gorges are walled in by magnificent cliffs so tapestried with trees as to be a forest set on edge. In this land one finds remnants of the successive waves of population which have followed each other since history began. The Greek regularity of feature and stateliness of expression are still to be seen at Agde. In Arles the Roman women still wear that coif which so sets off their superb beauty that it for ever disproves the axiom that women care to dress becomingly; else why does not the world adopt it? At Béziers is the spot where thousands of Albigenses suffered death for devotion to a purer faith than that of their persecuting neighbors. At Aigues-Mortes is that jewel-box of a walled town which St. Louis began. At Montpellier is one of the oldest universities in Europe. At Nîmes the Protestants made head against Louis XIV. At Pont-de-Montvert the Camisards slew the fanatic priest Du Cheyla. The Cévennes is one of the few spots in Europe where the English came into near relations with a strangely mixed Oriental race, and at last gave ground before it. Over this narrow space have marched the Greek, the Saracen, the Frank, the Frenchman, and the Englishman, every one with a hand heavy to strike and hollow to retain. Is it a wonder that the babbling Gascon is so rare a character in this Gascon country? It is a serious people, gay on occasion, but stiff from resistance to half a score of foreign masters, and surging back, after every suppression, into their old beliefs. Perhaps this became the great Protestant centre in France because Greek love of reason and Roman stubbornness survived here—older than the Church and stronger than persecution.

This long digression is after all a criticism, for Baring-Gould's 'Southern France' is a different and more matter-of-fact country, in which the historical emotions are kept carefully in check. He has undertaken "a book of preparation for intending tourists, that they may be able to understand what they see." For this laudable purpose the first necessity is to give the intending tourist some adequate idea of the strange and delightful scenery of the region. No proper impression can be derived either from the two brief chapters on topography, or from the cheap and characterless woodcuts which give so indefinite a notion of the cliffs and caves on which masonry clings as do lichens on boulders. The more effective woodcuts appear to be for the most part borrowed from Martel's 'Cévennes,' and have the usual merits of French popular scientific drawings: they are interesting works of the imagination. Some of the process pictures, especially those of the Cathedral of Rodez, are, however, both beautiful and genuine. The author takes us round about some of the scenic splendors, but he has evidently never been permeated by them. One cannot help wondering with what eyes he saw Montpellier le Vieux, when he describes it as in "a depression of the Causse Noir." The most remarkable thing about that city of the gigantic dead is that it is a high point, a great bastion of the Causse, commanding the country for miles about. The description of the gorge of the Tarn is more lifelike, though it is physically impossible that the Cirques des Baumes can ever have been "a vast cavern, three quarters of a mile in diameter." One wishes also for the proof that the Causses were wooded up to the time of the Revolution; the towns, with few exceptions, have certainly always lain in the gorges.

The first volume is given up chiefly to an account of the people of the country. Here Mr. Baring-Gould, in his zeal for complete preparatory information, irresistibly recalls the delightful discourse of the French pastor at Berne on the murder of Carnot. Parricide, he explained in an elaborate introduction, is wrong; fraticide is wrong, and also regicide and deicide; but he did not distinctly express an opinion on assassination. So Mr. Baring-Gould makes us acquainted with the "reindeer hunters," the "dolmen builders," the "men of iron," and the "rock-dwellers"; but, except for a brief chapter on the Caussenards and two more on Roquefort cheese and truffle-hunters, he hardly reaches the present agreeable inhabitants of the country. Whatever the interest of the tourists for whom the book is written in the Neolithic artist who

> "Sketched delightful mammoths on the borders of his cave,"

they are entitled also to a more detailed and distinct account of the living descendants of the cave dwellers and their invaders.

The second volume is practically historical, and hard to criticise because of the agglutinative character of Mr. Baring-Gould's mind.

Thus, Murat was born on the Causse de Gramat, and thence ran away while still a boy; therefore a long chapter of the 'Deserts of Southern France' is devoted to the career of this Caussenard in Paris, in Egypt, in Spain, in Russia; to his purple pantaloons and yellow boots, to the roasted cats of his kitchen on the retreat from Moscow. Apropos of the remarkable Byzantine churches of Périgeux, we have an essay on the Roman house, but nothing on the domed architecture of the churches of Nant, in the valley of the Dourbie. Notwithstanding a whole chapter devoted to the interesting "bastides," or free towns, the author returns to the same subject in the Murat chapter, and repeats his own language to the extent of nearly a third of a page. The explanation must be the same as that for the repetition of the narrative of King Hezekiah in Kings and Chronicles—that both narratives refer to an unknown original.

Not to recognize the genuine interest in his narrative shown by Mr. Baring-Gould would be ungracious. He has apparently lived much in the country, has explored the caves, inspected the cheeses, made plans of the dolmens, sketched the picturesque ruins, descended into the "avens," read more or less of the books enumerated in his excellent Appendix A, and stayed at the inns briefly described in Appendix C. The chapters on the castles, towns, and churches are full of borrowed historical and archæological lore; but the historical sketches are patchy; they have no continuity; they are not finished pictures of distinct periods or episodes, and the author deliberately omits the most picturesque and characteristic story—that of the Camisard war. He has some of the qualifications for his work, but not that sense of literary order and taste which is indispensable for a good book. He is oppressed by his own learning, multiplies examples which are only names to his reader, and jumbles together observation, legend, archæology, architecture, and history. The Causses deserve a more affectionate treatment, such as that suggested by Stevenson's inimitable 'Travels with a Donkey through the Cévennes.'

If any reader have a mind to test Mr. Baring-Gould's book, let him provide himself with the serviceable Baedeker's 'Southern France,' and the excellent illustrated guide-book, 'Itinéraire Miriam: Les Causses et les Canons du Tarn'—with which, by the way, Mr. Baring-Gould seems unacquainted; let him read Martel's elaborately illustrated 'Les Cévennes' and Miss Betham Edwards's the 'Roof of France'; let him study the detailed maps published by the French Ministry of the Interior (not the État-Général maps), and thereupon let him straightway take the steamer for Havre, or Bordeaux, or Genoa, and hasten to Marjevols, or Mende, or Millau, or Rodez, or Villefort, and thence into the heart of the Cévennes. There he may drive, or ride his bicycle, or float down the Tarn in a flatboat. Even in January the sun must lie warm in the "cirques" of the gorges, where winter resorts are sure to be established in no long time; in summer there is air enough on the Causses; in spring or fall the climate is as delightful as at Corfu. Anybody who can stay in small Italian towns can be comfortable at the hospitable, badly-drained and well-provisioned inns. Inhabitants of deserts are said to be unhappy elsewhere: if one would know the charms of a well-watered and commodious desert, penetrated by diligences and perforated by the telegraph, if one would experience the East without the long journey thither, let him betake himself to the Cévennes.

GLADSTONE'S HORACE, AND OTHERS.

The Odes of Horace. Translated into English by W. E. Gladstone. Charles Scribner's Sons. 1894. Pp. xii, 154.

The Odes of Horace. Books I. and II. Done into English verse; with Andromeda, Ariadne, and Jason. By J. Howard Deazeley, M.A., Merton College, Oxford. London: Henry Frowde; New York: Macmillan. 1894. Pp. iv, 91.

The Hawarden Horace. By Charles L. Graves, author of 'The Blarney Ballads,' 'The Green above the Red.' 2d edition. London: Smith, Elder & Co. 1894. Pp. vi, 91.

The Odes and Epodes of Horace. Edited with introduction and notes by Clement Lawrence Smith, Professor of Latin in Harvard University. [College Series of Latin Authors.] Boston: Ginn & Co. 1894. Pp. lxxxvii, 404.

ALL readers of Horace remember the flood of malediction he pours upon a certain tree which nearly killed him by its fall. Ode after ode gives utterance to these bitter feelings. That the woodman of Hawarden, never so happy as in swinging his axe, should, in the fulness of time, appear among the translators of Horace, seems in accordance with the fitness of things. Mr. Gladstone lays down in his preface most judicious rules for a version of Rome's solitary lyrist, beginning with the necessity of compression, a quality which not one of his own original works ever exhibited, and ending with melody, which indeed he has often introduced into his magnificent orations, but a melody constructed in other keys and with other cadences than those of Horace. But when it comes to working out these rules, Mr. Gladstone has failed, as so many brilliant and sensitive minds have failed before him, in recalling even a shadow of the charm which invests every strain of the friend of Virgil and Mæcenas. Compression he has sought to attain by destroying one of the most striking characteristics of English as opposed to Latin: he cuts out articles and particles with an unsparing hand, wherever their troublesome syllables would prolong his verse, till many of his lines read like a telegraphic message, as far removed as possible from the flow which is so marked a quality of Horace. And his own potent charm as an orator has scarcely a note in common with the charm of the hymn to Aphrodite or the odes to Dellius and Postumus. He has given his best energy to reproduce the sense and spirit of the original. He has drawn on the entire English vocabulary to avoid the elaborate circumlocutions of Francis, and he has wisely clung to the classic English metres, instead of straying off into the vagaries of Bulwer. He has, perhaps wisely again, made his metrical forms suit the temper of the odes, rather than use the same English form invariably for the same Latin. He has done a great deal; but the delicacy, the flow, the tone hovering on the borders of jest and earnest, and passing so easily into either as the poet demands; the new richness given to common words, the simplicity which attends the introduction of strange ones—in a word, the charm—is no more attained by Mr. Gladstone than by his many predecessors.

It would be unfair to give specimens of the worst failures—the mistakes in sense, the jolting lines, the uncouth words, the un-English inversions, unfortunate exaggerations of such as are strange even in Latin. Not a few odes are sad travesties of beautiful originals; and what is worst, Horace's best odes suffer most. As a not unfair specimen of the more successful efforts, take the appeal to the gods from *Jam satis terris:*

> Which god shall trembling Rome entreat
> A falling empire's weight to bear?
> How vestals find petition meet
> For ears less open now to prayer?
>
> To whom shall Jove the charge assign
> Our crimes to cancel? Come at last
> With clouds, Apollo, Seer Divine,
> About thy shining shoulders cast.
>
> Or please it thee, fair Venus, come,
> To laugh with Sport and Cupid taught,
> Or Mars, our founder thou; if Rome
> And thine own seed be worth a thought.
>
> Enough of thine insatiate swoop,
> Thy game of shout and burnished helm,
> And the fell rush of Marsian troop
> Their bleeding foes to overwhelm.
>
> Or, gentle Maia's winged son,
> If with an altered form content,
> Deign to be Cæsar's champion,
> Shrined in his earthly tenement.
>
> Long be thy joyous reign in Rome,
> Late the return to heaven be won,
> Nor earlier take thy passage home
> Our manners, foul with sin, to shun.
>
> As father and as prince abide,
> And here thy lofty triumphs gain,
> Nor let the Mede unpunished ride
> While Cæsar lives, and lives to reign.

In the first line, the word *populus*, so significant in Rome, is lost; in the third, Vesta's name is transmuted to an adjective, as, in the third stanza, the adjective *Erycina* becomes Venus. "Cancel" is a poor substitute for *expiandi*. The second line in the stanza to Venus is a mere perversion; the fourth line to Mars is good, but the introduction of the name, and the changed position, sadly weaken the force of *Auctor*. The next stanza is full of non-existent and non-Horatian imagery, and "troop" is exactly wrong for *peditis*. In the next, *ultor* is not "champion." "Shrined in his earthly tenement" is like Pope, or rather Darwin, as an expansion of *in terris*. Then when we come to *intersis populo Quirini*, we are offered "reign in Rome"—exactly what Augustus never dared to do, nor his best friends to propose; and the same blunder occurs in *te duce*. Perhaps *aura* fairly suggests a voyage; but "take thy passage" is painfully suggestive of a ticket office; and "the return to heaven be won" may be very well when Augustus is compared to Pollux or Hercules, but wholly wrong when he is identified with Mercury. Yet the worst of these mistakes might pass if only the air, the tone, or the flow were Horatian. But it is not; and they must stand in their full shadow.

Mr. Deazeley's version of the first two books of Horace can hardly be called more successful than Mr. Gladstone's. The translator has attempted some new forms, or rather new combinations of ancient forms of metre, to represent the Horatian strophes, but with scant success. Like his illustrious senior, he deals havoc, for the sake of compression, among the little words, and strains the English vocabulary, copious as it is, to give something of an equivalent for each Latin word. As far as the music of his line goes, he need not fear a comparison with the veteran. But there is always the terrible doubt which Matthew Arnold raised about Sotheby's and Wright's versions of the 'Iliad'—if there was any reason for their existing. The original poems which make up the rest of his little volume are in very melodious verse. But the inspiration of them hardly springs straight from Homer, or Euripides, or even from Apollonius and Ovid. There is too much Tennyson and Swinburne read into the lines of the ancient Hellenic story. Better let the dreamy second-thought of our century seek no themes to invest with its haze earlier than King Arthur, and leave

Ariadne and Jason to "the pure light of an Ionian sky."

Mr. Graves's very lively 'Hawarden Horace' consists of sixteen burlesque adaptations of as many odes of Horace, in the style of Thackeray's play on "Persicos odi." Their Latin titles all indicate, not obscurely, public or private friends of Mr. Gladstone, and they are supposed to be written by him in the true spirit of Horace's universally contented and moderate Epicureanism, in most amusing contrast to the stately yet often passionate philosophy of the great man of whom they make fun. Mr. Gladstone has not been renowned for seeing the humor of his antagonists; yet his classical sympathies must have kept him from taking offence at the wonderfully pat and melodious absurdities of Mr. Graves's volume. It deserves to be bought and read by every Horatian, who, if he knows anything of English politics in the last ten years, must laugh till he cries over it. We select one of the shortest odes, simply because it is such, a version of "Vile potabis," addressed "Ad Amicum"—in other words, Sir John Acton, who, though a Roman Catholic, was made a peer by Mr. Gladstone:

> Dear Acton, next Wednesday at dinner,
> I cannot but honestly think,
> You'll find that my claret is thinner
> Than that you're accustomed to drink.
> Twelve shillings a dozen it cost me
> That year—I remember it well—
> When Oxford, that loved me yet lost me,
> Created you Hon. D. C. L.
>
> The cheers by your presence excited
> That filled the Sheldonian dome,
> The Vatican vastly delighted,
> And sensibly gratified Rome.
> And so, for the savor historic
> That clings to my modest Bordeaux,
> You'll pardon its want of caloric,
> And vote it the choicest of Clos.

While on the subject of Horace, it seems right to award a word of appreciative notice to the elegant and scholarly edition of the Odes and Epodes by Prof. C. L. Smith, known to all Harvard students for a quarter of a century as a devoted teacher of the poet's works. Mr. Smith derived his appreciation of Horace from the late President Thomas Chase, one of our most thorough and refined scholars, and the pupil's work is worthy of the master's. To some of his variations on the conventional interpretations exception must be taken; especially to that in Od. iii., 30, 2, where, after Kiessling, he makes *situ* mean "decay," and translates "*regali situ pyramidum altius*," "loftier than the royal crumbling of the pyramids," *i. e.*, "loftier than the royal pyramids which will crumble." If he accepts *Marsi* in Od. i, 2, 38, and *vepris* in i., 23, 5, against all the MSS., it seems amazing he should retain the all but impossible *Apulicum* in iii., 24, 4. He hardly appreciates, though stating it, the full force of the argument for rejecting two lines in iv., 8. As was pointed out in our recent review of a life of Cicero, it seems very unnecessary to depart from the practice of the elder historians, and designate the triumvir not only as "Octavius" and "Augustus," but also as "Octavian." He is undoubtedly called *Octavianus* by Cicero and Pollio, to say nothing of later writers; but Cicero calls him *Octavius* almost alternately with the other, and the case of Brutus seems to show that the old name was frequently used after adoption had in strictness changed it.

THOMPSON'S RECOLLECTIONS.

Recollections of Sixteen Presidents, from Washington to Lincoln. By Richard W. Thompson. 2 vols. Indianapolis: The Bowen-Merrill Co. 1894.

THE title of this work is misleading, and is in fact a misnomer. Personal recollections of sixteen Presidents are almost totally wanting, and the disappointed reader will find merely a brief history of their several administrations. The value of this history must of course depend chiefly upon its trustworthiness in dealing with matters of fact, and on this vital point we are sorry to find it disfigured by serious inaccuracies and mistakes.

In referring to the charter of a United States Bank, and the policy of protection and internal improvements (i., 205-6), Mr. Thompson says:

"All these measures, and others incident to them, were directly involved in the Presidential campaign of 1840, and were so fully discussed before large audiences in every State and in almost every neighborhood, as well as in the newspapers, that the whole country was apprised of them, as well as of the arguments by which they were defended and assailed. I have personally participated somewhat actively in sixteen Presidential campaigns, covering a period of more than threescore years, and I do not hesitate to affirm that I have never known one when the distinctive political issues involved were discussed and investigated with more thoroughness. . . . This is certain, as every survivor of that period will remember, that the opinions of Harrison upon all these questions were well understood by the public—for what he thought and believed with reference to them was made the special object of public inquiry."

The intelligent survivors of the year 1840 will be amazed at these statements. The Harrison campaign was a national frolic. Its orators talked eloquently about "the hard times," and promised the people "two dollars a day and roast beef" if they would elect "Tippecanoe and Tyler too." The campaign was set to music, and the song seriously threatened to drown the stump speech. The Whig masses did not want argument, because they believed the political millennium was at hand, and they preferred to revel in the anticipation of it. Mr. Thompson talks about "the distinctive political issues involved"; but the convention which nominated Harrison avowed no principles whatever. He was not himself a Whig, but a strict-constructionist, who denied to the general Government all power except that which is *expressly* granted by the Constitution, and who boasted in his speeches that he had been educated in the school of the Henrys, the Masons, and the Jeffersons. He doubted the constitutionality of a national bank, and it could not be shown by his published letters or any other satisfactory proof that he agreed with the Whigs on the policy of protection and internal improvements. Indeed, it was his non-committalism on the leading Whig issues and his "neutrality of tint" which constituted his "availability," and led his managers to sacrifice Henry Clay in the Harrisburg convention, because of the right-angled character of his principles as a party leader. As to Tyler, he was not a Whig in any sense, but a Democrat of the Nullification pattern. There was, in fact, but one issue on which the Whigs were perfectly agreed, and that was a change in the national administration. To call such a demonstration a campaign of ideas and arguments is to trifle with the unquestionable facts of our history, and to bring into question the trustworthiness of Mr. Thompson's statements in dealing with other matters.

Mr. Thompson's treatment of Van Buren is equally surprising and indefensible. In speaking of his connection with Jackson and the advantages it gave him (i., 174), he says:

"If the intelligent searcher of our history shall carefully keep these considerations in mind, he will find it difficult to escape the conviction that, if Van Buren had not been elected President in 1836, we should have escaped our late civil war. History is something of a labyrinth, yet it is not impossible, in tracing the course of events, to discover the points where they work together and establish, as well as illustrate, its philosophy."

In support of this view, he cites the fact that in 1836 both houses of Congress disclaimed any right to meddle with slavery in the States or in the District of Columbia, and that the House of Representatives adopted Pinckney's resolution (afterwards known as Atherton's Gag Rule), which was finally abrogated under the leadership of John Quincy Adams. On the basis of this action Mr. Thompson thinks a final settlement of the slavery question was attainable, and would have been established but for the pernicious efforts of Van Buren, in the interest of his own ambition, to make the people of the South believe that the Northern States were hostile to their constitutional rights.

These views are so amazing that it is difficult to see how any student of American politics could ever have embraced them. History must indeed be "something of a labyrinth" if it has led Mr. Thompson so far astray. Such a peace-offering as the surrender of the right of petition and the freedom of debate could only aggravate and intensify the strife between the sections. As to the civil war, Van Buren could neither produce nor prevent the catastrophe, for the simple reason that it was the outcome of the anti-slavery conflict, which had its genesis in the concessions made to slavery in the formation of the Constitution. A man who undertakes to write the history of sixteen administrations ought to know this. Van Buren had faults and made mistakes, and this is true of all our famous public men; but he was a man of undoubted ability, and his private life was without reproach, while the record of his administration will compare favorably with that of a majority of his successors. On the slavery question he was not preëminently unfaithful to freedom. He opposed the repeal of the Missouri Compromise of 1820. On the great and vital issue involved in the annexation of Texas he took the right side, and maintained it in the face of the anathemas of the South. Of all this Mr. Thompson seems to know nothing, while charging him with fomenting a sectional strife which threatened the existence of the Union for the despicable purpose of improving his chances for office.

Mr. Thompson reiterates the charge which he has been repeating for fifty years, that the Liberty party defeated Clay in 1844. He has doubtless fully persuaded himself that this charge is true; but the fact is that Clay defeated himself by his vacillating course on the question of annexing Texas, as shown in his famous Alabama letters, which sorely grieved and disappointed many of his best Whig friends in the free States and fairly justified the action of the Liberty party. Mr. Thompson's partisan zeal as an old Whig blinds his eyes to other facts which easily account for Clay's defeat, such as Polk's Kane letter, which rallied the Democrats of Pennsylvania to his support under the banner of "Polk, Dallas, and the Tariff of 1842," the Plaquemine frauds in Louisiana, engineered by John Slidell, and the influence of Nativism, which had just broken out in our great cities and become a political power. All these were added to the heavy weights under which the Whig craft went down; but Mr. Thompson can see only the baleful hand of Abolitionism in accounting for the fall of his idolized leader.

Mr. Thompson's statements in dealing with the administrations of Taylor and Fillmore (ii., 315) are equally surprising. He says:

"Each of the compromise measures, in the order in which they were passed, became the law by his [Fillmore's] approval. In this respect he acted in precise conformity to the line of policy which Taylor had indicated, so that, in so far as the slavery question was involved, the two administrations were in full accord. That he thereby caused some dissatisfaction in the North is undoubtedly true, but this came from the 'Barnburners,' as they were called, who had rallied to the support of Van Buren, and who, while they did not receive the popular vote of a single State, kept up their organization, well knowing that it had a twofold effect—to divide the North and solidify the South. This, however, did not drive him from his course, and at this point in his history he exhibited, as it has always seemed to me, the very highest and most commendable qualities of statesmanship."

This is not history, but fiction. The administrations of Taylor and Fillmore in dealing with the slavery question were in direct antagonism. Taylor's plan of settlement looked to the early admission of California and New Mexico as States, without the slightest executive dictation or intermeddling with their action as Territories. He thought California was entitled to be admitted at once, on the merits of its application, and that it should not be loaded down with a Texas Boundary Bill, a new Fugitive Slave Law, or any action by Congress affecting the question of slavery in these Territories. He was, therefore, utterly opposed to Mr. Clay's scheme of compromise, which Senator Benton derisively named his "Omnibus Bill." This position exasperated Jefferson Davis and the extremists of the South, whose attempt to intimidate the President only made him more invincible. Clay and several of his compromise associates also completely lost their temper, and spoke of him with scorn and contempt, while both Northern and Southern members saw that the President's scheme of settlement would in all probability secure our Territories to freedom and free labor. It was a critical time in the anti slavery conflict, for it became evident on all sides that the President would never surrender; and when he died, "Clay's Omnibus," as Prof. Von Holst declares, "was left sticking in a swamp," where, there is every reason to believe, it would have remained if Gen. Taylor had not died at that critical moment. The Barnburners were dissatisfied with Fillmore because he repudiated the policy of his predecessor, and even the Free Soil members of Congress, who had zealously opposed Taylor's election, were now his best friends. His sympathies were with them, and when Fillmore turned his back upon his anti-slavery professions as a New York Whig, the leading anti-slavery men throughout the country denounced him as an apostate, as they afterwards denounced Webster for his seventh of March speech. To say that Fillmore "acted in precise conformity to the line of policy which Taylor indicated," and that, "so far as the slavery question was involved, the two administrations were in full accord," is to make a jest of history. It profanes the name of Taylor by linking it with a policy which he indignantly spurned; while it seeks to whitewash the memory of Fillmore as the champion of the compromise of 1850.

But our space precludes further criticism in detail. In the matter of style the work is fairly well done, and the interest is well sustained. The account of the trial of John Quincy Adams is especially graphic and fascinating. The radical fault of this history, as we have already indicated, is its lack of moral tone. Its atmosphere, so to speak, is unhealthy. What the writer thinks about negro slavery, and whether he believes the civil war was caused by the abolitionists or the slaveholders, are matters about which the reader is left to his conjectures. The fatherly tenderness with which he speaks of Pierce, Fillmore, and Buchanan is equally characteristic, and is in striking contrast with Hildreth and Von Holst, who have set us the wholesome example of unsparingly telling the truth about our public men. Indeed, Mr. Thompson's point of view has tainted his entire work. His early devotion to slavery has never been cooled, and constantly broods over his pages. While in Congress in 1842 he voted to censure Mr. Giddings for introducing his *Creole* resolutions. He opposed the Free Soil movement of 1848, and has been the defender of the Compromise of 1850 ever since its adoption. He was a zealous champion of the Indiana Black Laws. He justified the repeal of the Missouri Compromise, and condemned all organized movements in the free States to make Kansas free. He declared that the refusal to admit Kansas as a State on account of slavery would be a virtual dissolution of the Union. He believed the slaveholders had as perfect a right to take their slaves into the Territories and hold them there, as the people of the free States had to do the same with their cattle. He argued that the discussion of the slavery question by the people of the free States was unconstitutional, and that slavery was sanctioned by Abraham and the patriarchs, as well as by Christ and his Apostles, while it involved no moral question whatever. He believed the South had always acted generously towards the North, and never committed any aggressions upon her rights, but that the North had always been the aggressor. He was a Know-Nothing leader in 1856, and one of the State electors for Fillmore, and in 1860 he took the field for Bell and Everett, and denounced the Republican leaders as nullifiers and disunionists. That a writer with such a moral outfit and surveying the field of politics from such a standpoint could write American history truly, was to be expected only by the believers in the miraculous; while his recognized leadership in a party which was founded nearly half a century ago by Lincoln, Seward, Sumner, and Chase, and which prides itself on the emancipation of 4,000,000 slaves, is a frightful illustration of the truth that "politics makes strange bedfellows," or a melancholy confession of party degeneracy.

The Life of Jonathan Swift, Dean of St. Patrick's, Dublin. By Henry Craik. 2d edition, with portraits. 2 vols. Macmillan & Co. 1894.

THERE are two ways of writing biography, both good. If Mr. Forster had completed his Life of Swift, we should have had a vivid picture, not only of the man, but of the time. We should have been introduced to Addison, Pope, Steele, Arbuthnot, Sheridan, as they lived and talked, and should have watched the bewildering shifts and changes of politics as the political kaleidoscope kept turning. But such a book would have been at least twice as bulky as that before us. Mr. Craik has limited himself to the facts of Swift's life, with no more extraneous matter than is necessary for understanding the story. But he has spared no pains in collecting his material: he has sifted and weighed the evidence on doubtful points with laudable candor; and while a conscientious endeavor to get at the exact truth is apparent throughout, his attitude towards his subject is distinctly sympathetic and friendly. The result is that we lay down the book with a worse impression of Swift than that produced by the lurid painting of Macaulay. Macaulay, when handling a Tory, and especially an apostate from the Whigs, never shrinks from suppression, distortion, or insinuation: he dips his brush in the darkest colors. For this personal equation the reader is ready to make the necessary allowances; but when we find a friend and apologist making no better defence than is made here, the case, we feel, must be bad indeed.

We are not disposed to pass any harsh judgment on Swift's political career. Whether he quitted the Whig party because the Tories seemed then to hold the winning hand, or because it had not done enough for him, or from some more creditable motive, is not now of much account. Political disloyalty was epidemic, and almost everybody of mark was mixed up in questionable intrigues, if not tampering with positive treason. Enthusiasm of all kinds was dead, and nobody was willing to be a martyr for a cause that he only half believed in. The only real loyalty left was with the uncompromising Jacobites, and their cause was as hopeless as it was insensate. Swift was at best but a half-hearted Whig, and the change was not great to a half-hearted Tory.

But it is his personal relations that give the dark side to Swift's character. It is clear that he was selfish, callous, and vain to an extraordinary degree; bitterly and implacably resenting the least slight to himself, and brutally indifferent to the feelings or the rights of others. So conspicuous are these traits that his friendly biographer has to invent special pleas for him—that an extraordinary genius like Swift cannot be judged by ordinary standards, and that his cruelty to friends and kindred was a kind of self-torture practised for the discipline of his own soul. For example, just when he felt that his foot was on the ladder which led to promotion, his only sister married a currier of Dublin. True, he was a man of education, well-to-do, and moving in respectable society. But disgust at this alliance with a base mechanic craft was enough to cancel all ties of blood, and Swift broke off all connection with his sister for ever. It is true that when, by her husband's bankruptcy and death, she was left a penniless widow, he allowed her a pension; but he saw her no more, nor otherwise recognized her existence. As Mr. Craik puts it, "with his usual self-torture, he refused himself the boon of personal affection for the one really close relation that he possessed."

The episode of Miss Waring is still more characteristic. When Swift was only the poor prebendary of Kilroot, on a stipend of £100, he made passionate love to this lady, who had some fortune. The lady did not at once either accept or reject him. So the matter rested till he had been taken into the service of Lord Berkeley, had accompanied that nobleman to England, and the vision of political preferment and fortune was before him. Then he "found it needful to put a period" to this encumbering affair, and wrote to his "Varina" that he doubted her fitness to be his wife, and that the idea had better be given up; but if she is disposed to insist on it, he is willing to take her, "without regarding whether your person be beautiful or your fortune large." Such a letter, the candid biographer admits, would have been brutal in any one but Swift; with him it is "unsparing truthfulness," combined with imperviousness to sympa-

thy. It is true, he showed the same callousness of heart where his own interest was not concerned, as is seen in that passage in his journal where he chuckles over the fact that he had arrived just in time to prevent the secretary from signing the pardon of a man condemned to be hanged. He knew nothing of the man except that he was "a fiddler," "and so," he triumphantly ends, "he shall swing." Mr. Craik does not mention this very characteristic anecdote, so we do not know whether he would call it an antinomy of genius or an act of spiritual discipline.

The circumstances involving the deepest blot on Swift's fame, his heartless treatment of Vanessa, are conscientiously related and his conduct but faintly excused. "He humored her passion," and "it played only on the outside of his life," we are told. He kindled and cherished the affection of a pure and tender woman, allowed her passion to grow unchecked, and then killed her as cruelly as if he had plunged a dagger into her confiding heart; and we are told that she was the unhappy victim of "the self-absorbed loneliness of genius." No doubt; but might this not have been expressed in directer phrase?

Mr. Craik is convinced of Swift's marriage to Stella, and states the arguments very fully in an appendix. We cannot see that the case has been made out on either side, but incline to doubt the marriage. There might be reasons why Swift should not marry; but we can see none why the pair should go through a form which was but the mockery of a holy rite, which in no respect changed their relations, and was to be kept for ever secret. For our own part, we believe Swift to have been absolutely incapable of love to man or to woman, as he was incapable of that self-abnegation which is love's essence. He liked dearly to be flattered and caressed, to have great lords call him "Jonathan," to have ministers ask his advice, and duchesses solicit his acquaintance; and he liked to write about all this to Stella, and tell her how he despised them all. And when, after all, no bishopric fell to his share, and he saw that an Irish deanery was the highest point of all his greatness, then he tells us that he despises and loathes mankind. Is this the misanthropy of Timon or of Apemantus?

Swift's unquestioned power of attracting and imposing on both men and women must have been due to some personal quality which we seek in vain in his works. His political tracts, vigorously as they are written, show no deeper statesmanship than temporary expediency; his satires are bitter and usually coarse lampoons, with neither the energy of Dryden nor the keenness of Pope. The 'Tale of a Tub,' by many thought his best work, fails to leave any permanent impression on the reader beyond that of a series of bitter gibes without unity or definite purpose. But one thing he certainly did, and we thank him for it: at a time when elegance was thought to be all in all in writing, he showed what power lay in a simple virile style, and what plain, homely words could do when managed by a master's hand. His style alone preserves his works from joining that respectable company on the shore of Lethe, of "books which no gentleman's library should be without."

Criticisms on Contemporary Thought and Thinkers. Selected from the *Spectator*. By Richard Holt Hutton. 2 vols. Macmillan & Co. 1894.

Mr. Hutton's essays are excellent specimens of the best sort of critical and controversial writing. His plain, straightforward, and very lucid style is an admirable vehicle for what he has to say about the thought and thinkers of the day. No one can read these volumes without becoming impressed with the very agreeable feeling that his own power of criticism has been heightened by the perusal.

On the whole, we have found what we may call the non-literary essays the best—for instance, those on Carlyle and Mill. Here Mr. Hutton is thoroughly at home. In his literary criticism he is apt to be a little too deep—willing enough, perhaps, to recognize the fact that literature should be judged as literature—recognizing the danger of groping about for explanations of the character of the finished product in that of the man himself—but still dissatisfied unless he is sure that his plummet has got a little lower down than all the other plummets. For criticism of a poet like Burns, for instance, Matthew Arnold is enough. He may be right when he discovers "Tam o' Shanter" a more genuine literary product than "A Man's a Man for a' That"; but when Mr. Hutton adds to this that in the latter poem Burns was expressing "what he wished to feel, but on the whole did not succeed in feeling, *though it would have been better for him if he had succeeded*," we feel that really we are beyond our depth, and cannot help suspecting that Mr. Hutton is too. If Burns had succeeded in feeling what he wished to feel but did not, it might have been better for him as a man and a poet, but he would obviously have been a totally different man and poet; and what he would have been had he been not Burns, but somebody else, it seems idle to speculate. Of course it is absurd to say that you shall not examine Burns's poetry in the light of what we know about his life. We cannot, perhaps, prevent the one from influencing our judgment of the other; but certainly no habit is more apt to warp the mind, especially of the English-speaking critic, and nothing, we may add, so fosters the power of seeing extremely far into millstones.

But when Mr. Hutton is in his own field—that is, when he is discussing pure thought—he is a master. His essays on Mill and Carlyle are excellent specimens of criticism of a very keen kind. A better analysis and explanation of Carlyle's relation to "Shams" we have not met with anywhere. The following is the substance of it:

"It is in some respects curious that Carlyle has connected his name so effectually as he has done with the denunciation of Shams. For the passionate love of truth in its simplicity was not at all his chief characteristic. In the first place, his style is too self-conscious for that of sheer self forgetting love of truth. No man of first-rate simplicity—and first-rate simplicity is, I imagine, one of the conditions of a first-rate love of truth—would express commonplace ideas in so roundabout a fashion as he. . . . What he meant by hatred of shams, exposure of unveracities, defiances to the 'Everlasting No,' affirmation of the 'Everlasting Yes,' and the like, was not so much the love of truth as the love of divine force—the love of that which had genuine strength and effective character in it—the denunciation of imbecilities, the scorn for the dwindled life of mere conventionality and precedent."

In other words, it is not really unveracity and insincerity that he hates, and it is not Truth that he worships, but force and strength; and what he called "cant" was not hypocrisy, but obsolete, obsolescent, or even mistaken principles.

A large part of Mr. Hutton's essays is devoted to controversy. He is a stout foe of all materialism, necessarianism, and agnosticism, and a firm believer in a personal God, in freedom of will, and in a future life. In logic-chopping on these subjects he is indeed an expert controversialist. Perhaps he has at times a tendency to be what Carlyle called "sawdustish," but that is almost inherent in controversial writings on these subjects. Very likely, also, he is here and there unfair—as, for instance, in his attack on utilitarianism, in which his account of that philosophy is certainly a caricature. But in the main, as a champion of religion he is very successful.

United States: Facts and figures illustrating the physical geography of the country and its material resources. Supplement I.—Population, Immigration, Irrigation. By J. D. Whitney. Boston: Little, Brown & Co. 1894.

Within the past few years large amounts of money have been voted by Congress for the investigation of the various phases of the irrigation problem. These appropriations have been urged on the ground that it was the duty of the Government to find some way by which the water necessary for agriculture, which nature had denied to the arid and semi-arid regions, could be artificially supplied. The two methods by which more water can be made available are, first, the better utilization of waters already on the surface, and, second, the bringing up of underground waters to the surface. The most evident method of accomplishing the first is the establishment of storage reservoirs near the sources of present streams, by means of which the water now running to waste in those seasons when it is not needed for purposes of agriculture, could be held back and distributed at the proper time. The only known method of bringing underground waters to the surface is by means of artesian wells, and a very strong popular belief exists in certain parts of the country that there is a great underflow beneath the plains, constituting actual rivers whose volume of water rivals if not exceeds that of those on the surface.

The investigations into these methods of increasing the water-supply of the arid region were mainly conducted under the direction of the Department of Agriculture and the United States Geological Survey, but reports have also been issued by various other Government departments and by Congressional committees. In the present supplement to his able work on the physical geography and material resources of the United States, which has been already noticed in these columns (1889), Prof. J. D. Whitney has devoted most of his space to a critical examination of these various reports and a discussion of the different phases of the irrigation problem. He shows that the popular idea of the underflow is an absurd one, and that the only professedly scientific arguments that have been made in favor of it by one of the special agents in charge of this investigation are incorrect deductions from erroneous premises. He considers that, except under the most favorable geological conditions, the supply of water from artesian wells cannot be expected to be sufficient for agricultural uses, and even then only for very limited areas. He points out, moreover, that irrigation under some conditions, especially when the waters carry a considerable amount of certain classes of impurities in solution, may be hurtful rather than beneficial to the soil, as has been practically demonstrated in India. The breaking of the Johnstown and Hassayampa dams has shown what a danger storage reservoirs may be to the inhabitants of the valleys below, and demon-

strated the necessity of careful construction and constant watching by competent engineers. On the other hand, the experience of Eastern cities in building reservoirs for increasing their water-supply gives an idea of the enormous sums involved, should the building and control of storage reservoirs in the West be assumed by Government, as would seem to be the logical outcome of these investigations.

In an appendix Prof. Whitney discusses the broader question "whether changes of climate can be brought about by the agency of man." Here again he puts himself on record in opposition to a popularly accepted theory, in that he gives his reasons for disbelieving that the planting of trees will have any effect in permanently increasing the rainfall in a given region, and shows that the statement, made by so high a scientific authority as the chief signal-officer of the army, that the rainfall in the semi-arid region has increased since its occupation and cultivation, is not supported, but even controverted, by facts. He doubts, even, what has been so generally believed as to be almost an axiom of physical geography, that deforestation has been the real cause of increasing aridity in certain regions of the world during historical times.

Prof. Whitney's criticisms deserve careful consideration by those who are called upon to direct legislation with regard to irrigation, not only for their high scientific authority, but because of their freedom from any suspicion of being influenced by interested motives.

The Liberation of Italy: 1815–1870. By the Countess Evelyn Martinengo Cesaresco. London. New York: Scribners. 1894.

Countess Cesaresco has given us a story, rather than a history, of Italy's struggle for unity and independence, and it is, in many respects, a well-told story. The only existing works in English with which it may be said to compete are Probyn's 'Italy: 1815 to 1878,' which is more formal, and Miss Godkin's 'Life of Victor Emanuel.' Countess Cesaresco enlivens her narrative with anecdote, and with expressions of her personal preferences and antipathies, much more than Probyn does, and we have found it much more entertaining to read. It should be added that it is a quarter larger than his, which allows her to pursue a different treatment.

The early part of the Countess's narrative lacks charm and effectiveness. She does not sufficiently emphasize the lesson taught by the abortive insurrections in 1820, 1821, and 1831; and when she comes to the great Year of Revolutions, 1848-9, she does not show how each of the parties had its trial and was found wanting. By no mere coincidence was it that ultra-radical democrats controlled Piedmont, Tuscany, and Rome in March, 1849. Possibly the entangled events of that epoch could not be satisfactorily unravelled in the course of seventy printed pages; certainly, the story of Italy can be told much more clearly after 1849, with Piedmont the acknowledged leader, than before that time, when there are the doings of half-a-dozen states and as many factions to be chronicled. Beginning with the campaign of 1859, the work shows a marked improvement, perhaps because the author was herself a witness of the events she describes, and glows in remembering the emotions which every Italian and every lover of Italy then felt. She brings out, more distinctly than has yet been done in English, the very ticklish, uncertain, and dangerous position of the Italian cause after the peace of Villafranca, and again before Garibaldi surrendered his dictatorship in Naples, and during Rattazzi's wild-cat administrations. She devotes more space than usual to the mismanaged campaign of 1866—an episode which is usually passed over with meagre mention, although at Lissa in that year was fought the last great naval battle—and her account of the Mentana fiasco is disproportionately detailed. In general we find her verdicts safe. She gives due credit to the various elements which went to the making of Italy, but it is evident that Garibaldi is her hero, and that Cavour and Mazzini kindle less enthusiasm in her, though she acknowledges their indispensable work.

The style in which the book is written would fit short essays better than an extended history. Obvious sarcasm, at times scarcely distinguishable from persiflage, fails in the long run to enliven; of this rhetorical instrument the Countess makes frequent use. She does not lack earnestness, but she sometimes lacks skill to express it. On the other hand, many of her epigrammatic phrases are more than clever, because they are more than half true. Thus, she says of the English volunteers who arrived a day too late to join Garibaldi in the battle of the Volturno: "Had they been in time for the fight, they would doubtless have left a brighter record than the only one which they did leave—that of being out of place in a country where wine was cheap." But to an historical student the most characteristic, if not irritating, quality in the book is the glibness with which the Countess asserts facts for which she produces no authority. When she tells us, for instance, that at such a date Victor Emanuel carried on secret intrigues with Mazzini, of which even the royal ministers had no knowledge, we naturally expect to learn where she got this information; but she never condescends to footnotes. Herein she makes a great mistake. If she has had, as she implies in her preface, access to sources hitherto unbroached, she ought at least to cite them. That she ignores this practice may be due to the fact that she grew up in a generation which did not teach women the difference between fact and opinion in matters of evidence.

Numerous misprints and inaccuracies might be pointed out, but a more serious defect is the lack of an index. Will British authors and publishers never develop an intellectual conscience? Good type and paper and photogravures of Garibaldi, Mazzini, Cavour and Victor Emanuel—all but the last of which are very good—make the volume attractive, and the last word we shall say about it is that it is worth reading.

The Hero of Esthonia, and Other Studies in the Romantic Literature of that Country. Compiled from Esthonian and German Sources. By W. F. Kirby, F.L.S., F.E.S., etc., corresponding member of the Finnish Literary Society. London: John C. Nimmo. 2 vols.

This extremely interesting and valuable contribution to the literature of folk-lore is the outcome, Mr. Kirby informs us in his preface, of his studies in Finnish popular tales. He had expected to find in the 'Kalevipoeg' merely an Esthonian variant of the Finnish epic, the 'Kalevala,' of which he is preparing a critical English edition; but he found it so dissimilar, and at the same time so interesting, when divested of the tedious and irrelevant matter which has been added to the main story, that he decided to publish a full account of it in prose, especially as nothing of the kind has yet been attempted in English, beyond a few casual magazine articles. To his translation of the 'Kalevipoeg' the author has added a selection from the great mass of Esthonian folk-tales, which have never appeared in English, with a few ballads and short poems. How great is the mass of Esthonian folk-lore, much of which has not yet been published even in its native garb, may be judged from the collection of Pastor Jacob Hurt and his coadjutors alone, As the result of three and a half years' work. Pastor Hurt possesses more than 20,000 items of epics, lyrics, wedding songs, and so forth; about 3,000 tales, 18,000 proverbs, and 20,000 riddles, besides a large collection of magical formulæ, superstitions, and the like. Published collections in Esthonian and German augment these figures, already sufficiently surprising for the small tract of country represented on the helpful sketch-map appended to the book. Scientific interest in their national folk-lore was first aroused among Esthonians about the year 1838; popular interest is of even more recent date.

The 'Kalevipoeg,' or Lay of the Son of Kalev, consists of twenty cantos and about 19,000 verses. The metre is the eight-syllable trochaic, the commonest metre of the Esthonians and the Finns, which Longfellow rendered familiar to us in 'Hiawatha.' In the sketch of the national mythology which he prefixes, and which is of special interest to students of the 'Kalevala' as explaining the similarities to and variations from the inhabitants of the Finnish Olympus, Mr. Kirby states his belief that Finnish and Esthonian religion can be traced through four well-marked stages: (1) Fetishism; (2) Nature-worship; (3) The transitional stage marked in the 'Kalevala,' where the heroes sometimes pray to the gods in conventional Christian phraseology, and at other times try to compel their assistance by invocations and spells; (4) Mediæval Christianity. The 'Kalevipoeg' is a much more archaic and more heathenish poem than the 'Kalevala.' The mythical hero, of gigantic size, whose adventures are contained in this national epic of Esthonia, is supposed to have ruled over the country in its days of independence and prosperity. He is evidently the Kullervo of the Finnish 'Kalevala,' and is called by his patronymic, Kalevipoeg, or Kalevide, the son of Kalev. Witchcraft, sorcerers, visits to the underworld, the uprooting of gigantic oaks, the rescue of fair maidens and other oppressed persons, and the other ingredients of epic lays, including the death of the supernatural hero, are all present in the 'Kalevipoeg.' But there is a certain freshness of invention and a poetry about them which make these volumes most delightful reading.

The same can be said of the folk-tales. It might have been supposed that these tales of Finnish-Ugrian origin would be affected by the Slavic folk-lore of their neighbors, the Russians. But the author is quite correct in stating that there is hardly an element of resemblance, in either the tales or the epic 'Kalevipoeg,' to the corresponding departments of folk-lore in Russia. What few foreign elements are visible are apparently, says Mr. Kirby, Scandinavian or German; but he frequently calls attention in his notes to resemblances with the 'Thousand and One Nights' Entertainment.' There are counterparts to Cinderella, Blue Beard, and Tieck's well known story of "The Elves" (which must have been derived from a common source with its Esthonian version called "The Wood of Tontla"), and to other cosmopolitan stories.

It would be difficult to find anything more

delicately beautiful and poetic than the story which relates how "The Milky Way" came into existence. Lindu, the Queen of the Birds, after rejecting the North Star, the Moon, and the Sun, accepts the wooing of the Northern Light. But the Northern Light must journey back towards midnight; he cannot tarry. He promises to return soon for the wedding and carry the maiden home. Lindu makes all her preparations, but the winter passes; then the spring passes. Summer arrives, but the bridegroom comes not. Lindu sits in the meadow by the river in her bridal robes, veil, and wreath, her tears streaming in little brooks, and heedless of her charges, the birds, who fly about from place to place, not knowing what to do, whither to migrate, where to find their food. Her father, Ukko (the Old God), the supreme deity, commands the winds to bring her to him. The winds bear her gently to heaven, where they set her down in the blue firmament. There dwells Lindu still, in a heavenly pavilion. Her white bridal veil spreads from one end of the heavens to the other, and he who lifts his eyes to the Milky Way beholds the maiden in her bridal robes. Thence she still directs the birds on their long migrations. She gazes at and waves her hand to the Northern Light, and in winter the Northern Light visits and asks after his bride, but they may not hold their wedding.

Hardly inferior are the legend called "The Maiden at the Vaskjala Bridge," which explains how the woman came in the Moon, and "The Song-God's Departure"; while "The Moon-Painter," which relates how there came to be a man in the Moon, is a good specimen of the ingenious and entertaining class of legends. It is seldom that such a delightful and harmless collection of folk-tales is published. It would seem as if a selection of them, properly illustrated by an artist of fantastic imagination, ought to prove successful if issued as a new book of fairy-tales for children and adults.

A Concordance to the Poetical Works of John Milton. By John Bradshaw, M.A., LL.D. London: Sonnenschein; New York: Macmillan. 1894.

THE late compiler of this work reproaches a forerunner, Mr. G. L. Pendergrast, who published a concordance to Milton in 1857 at Madras (where Dr. Bradshaw's own labor also was performed), with having left his editing to the printers, "who apparently cut off from either end of a quotation such words as would not fit into a line of the Concordance, thus rendering it necessary for one consulting the work to refer in most cases to the passage in Milton." Strange to say, his own printed Concordance is strictly one-line, with occasional bald fragmentariness like this under *tangles*, "in *t.* and made"; under *peril*, "and *p.* great provoked who thus." The consequence is, that no one can browse with delight in these pages as he can in Bartlett's Concordance to Shakspere. The compression is sometimes reached by omissions, indicated by dots. There is no key to the initials which denote the several works quoted from.

There is not much more to be said about this undertaking in itself considered. Its utility is obvious, both as an index and philologically in comparison with other concordances, of which, for the latter purpose, we cannot have too many. We have run through the short letter Q in this work and in Abbott's Concordance to Pope. Milton employs but 32 separate words to Pope's 40; he has 12 which are lacking in Pope, Pope has 13 which are lacking in him, including quality, quarter (of time), queer, query, quibbles, quickness, quill (pen), quiver (*vb.*). *Quality* seems strangely disused by Milton, considering how copiously Shakspere presses it into service. But Shakspere's vocabulary admits under Q 47 words not to be found in Milton, of which all but 10 are in vogue to day. Shakspere, like Pope, has no use for Milton's quill (the musical attachment); like Milton, but unlike Pope, for queer, query, and quibbles. There is no end to considerations like these, for which, in the fore part of the alphabet, we may turn to Dr. Murray's Dictionary in connection with the above-named concordances.

The Revolutionary and Napoleonic Era: 1789–1815. By J. H. Rose, M.A., University Extension Lecturer in Modern History. Cambridge (Eng.): The University Press; New York: Macmillan. 1894.

THE aim of the Cambridge Historical Series, which this volume begins, and of which Prof. G. W. Prothero is the editor, is to describe European and colonial history from about the fifteenth century. Mr. Rose's treatment of his subject is fresh and vigorous, but the special value of his book comes from his interest in the economic side of the struggle between Napoleon and England. This has enabled him to give greater intelligibility to Napoleon's later career. The prevalent opinion which attributes the wars after 1807 to an insatiable and reckless ambition he rejects, and clearly shows that they were due to the necessities of that Continental system by which the Emperor sought to humble the mistress of the seas. The degree to which Mr. Rose has enhanced the interest of his book by turning aside from the beaten paths of military and political history leads one to wish he had departed more radically still, and had not simply summed up social changes, but had described them. The effect of the Continental system upon the development of manufactures in France and Germany has received no adequate treatment in English. It is difficult to find out to what extent internal free trade prevailed throughout the Empire and its vassal States, and yet this is a question of the first importance.

The weakest part of Mr. Rose's book is his description of the Revolution in France. His lack of interest in it is shown by the fact that he devotes exactly the same space to the Waterloo campaign as to the history of France from the treason of Dumouriez in March, 1793, to the end of the Convention in October, 1795. Various statements in these meagre pages are open to objection; as, for example, the assertion that "the records of the Commune show a careful preparation for" the September massacres. Doubtless the Commune can be held responsible because it did not effectually prevent these massacres, but M. Aulard has proved in the 'Révolution Française' that the Commune was the only constituted authority which made any definite effort to stop them. Among minor inaccuracies may be mentioned the reference in the description of the Royal Session, June 23, 1789, to the Grand Master of Ceremonies as "an usher, de Brézé," a change of function which gives an insignificant setting to Mirabeau's great retort. Mr. Rose also again attributes to Barère that phrase about "coining money on the Place de la Révolution" which Barère himself repudiated with horror, and which is probably as much a fable as his motion that "Terror be made the order of the day."

It is noticeable that Mr. Rose visits a greater moral condemnation upon Napoleon for the murder of the Duc d'Enghien than upon the British Government for its attack upon Copenhagen in time of peace—an attack which destroyed eighteen hundred houses and killed nearly two thousand of the inhabitants. English writers feel that in her struggle with Napoleon England was fighting for some principle, like the liberation of Europe, and they therefore regard with complacency her brutal violations of neutral rights throughout the contest.

This volume is furnished with several excellent maps.

Polar Gleams: An Account of a Voyage on the Yacht *Blencathra*. By Helen Peel. Chicago: A. C. McClurg & Co. 1894. Pp. xx, 211. 8vo. Illustrated.

CAPT. JOSEPH WIGGINS of Sunderland, the well-known arctic shipmaster, realizing the importance to Siberian commerce of an outlet by sea, and the profitable returns which would result from the demonstration of its existence, boldly entered the Kara Sea in 1874 and cruised about in those waters for eight weeks. The following year Nordenskiöld in the *Pröven* entered the mouth of the Yenisei in safety and repeated the voyage successfully, on the *Ymer*, in 1877.

These explorations showed the practicability of the route in most years, during the summer months, and Capt. Wiggins made a number of subsequent voyages of which a fair proportion turned out well. The construction of the Siberian Railway having been decided upon, it became a most important matter that some way should be found to transport rails to various intermediate points on the great Siberian rivers, in order that construction might proceed on several sections of the route simultaneously. The first expedition of this sort was prepared in 1893, and comprised the steamer *Orestes*, with 1,600 tons of steel rails, the steam-yacht *Minusinsk*, with machinery, and the steam-yacht *Blencathra* as a convoy. The last named is better known to arctic travellers as the old *Pandora* of Sir Allan Young, with a good arctic record. This little fleet was joined at Vardö, Norway, by three light-draught vessels of the Russian navy. The *Orestes* was commanded by Capt. Wiggins, and the naval contingent by Lieut. Dobrotvorski.

Leaving Vardö on the 22d of August, the Kara Sea was entered a week later, the Yenisei on the 2d of September, and the port of discharge, Golchika, 200 miles up-stream, the following day. After three weeks spent in discharging, the Russian vessels proceeded on their way up stream to Yeniseisk, and the *Orestes* and *Blencathra* on their homeward voyage. The yacht touched at Archangel and various Norwegian ports, reaching Dundee early in November. The complete success of the experiment was followed by an order for the transportation of 19,000 tons of rails during the season of 1894.

Miss Peel was one of two ladies, guests of the owner of the *Blencathra*, the first of their sex to make the passage of the Kara Sea. Her experiences are told in a lively and readable manner, and illustrated by a number of creditable pictures from photographs taken *en route*. She is a godchild of Lord Dufferin, who contributes a most amusing preface, while Capt. Wiggins adds a chapter on his journey to Yeniseisk and St Petersburg, and some notes on Nansen's polar expedition. Mr. Frederick G. Jackson, who had been a passenger on the

Orestes, sends a letter on his proposed arctic exploration; and ten pages from an official prospectus of the Siberian Railway, together with a brief abstract of the log of the *Blencathra*, are included in an appendix.

The book is handsomely got up, and serves very well as a memorial of the first important commercial event in the development now planned for Siberia, and also, as Lord Dufferin remarks in the preface, "exhibits the untamable audacity of our modern maidens."

Sea and Land: Features of Coasts and Oceans, with special reference to the Life of Man. By N. S. Shaler, Professor of Geology in Harvard University. Charles Scribner's Sons. 1894.

More than two-thirds of the surface of the globe is occupied by the waters of the ocean, whose floor over immense areas is at a greater depth below its surface than the summits of the highest mountains are above it. When we consider that, on land, life is confined to a few score of feet above its surface, but, in the ocean, since the greater part of its creatures may freely swim or float, life may extend miles below the surface, we see that the quantity if not the variety of forms of organic life which flourish in it must be vastly greater than that of land life, and that it presents an inexhaustible field for scientific research. Although man has for centuries travelled up and down upon the surface of the ocean, and an important part of his sustenance is derived from it, it is only within a comparatively few years that any attempt has been made to investigate thoroughly the character of life and the conditions that prevail within its depths. One of the most striking results of the investigations thus far made has been the confirmation of the theory already held by advanced minds among geologists, that the relative distribution of land and water on the surface of the globe has been practically what it is now since the earliest geological times—in other words, that the abysmal depths of the ocean have never been land-areas, as was supposed by the early geologists, reasoning from the fact that marine shells are found in the limestones (supposed to be necessarily of deep-water formation) that now form a large proportion of our mountain ranges. Many new and interesting discoveries have also been made as to the life of the deep sea, the character of its bottom, and other matters, which are set forth in popular form in the volume before us in Prof. Shaler's well-known and admirable style. He has not confined himself to the depths of the ocean, but gives a chapter to the icebergs which float upon its surface and are a source of constant and ever-recurring danger to European tourists. He also treats of its borders, which have been one of his special fields of geological study, of the formation of sea-beaches and harbors, and the influence the latter have had upon civilization.

Whoever loves the ocean and makes annual visits to the seashore can hardly fail to read with interest the rational and scientific explanations here offered for many familiar phenomena, and thereafter view with increased pleasure the well known features of his favorite summer resorts.

A Constitutional History of the House of Lords, from original sources. By Luke Owen Pike, M.A., Assistant Keeper of the Public Records. Macmillan & Co. 1894.

Historical workers in England, as in other countries, fall into several distinct classes. There are the professors, like Dr. Stubbs; the private scholars, like Mr. Freeman during the greater part of his career; the men of letters, like Mr. Froude. One class, however, has for some time been singularly absent—that of the "archivists." Fifty years ago it was different, as the great names of Sir Henry Ellis and Sir Francis Palgrave sufficiently testify. To whatever the disappearance of the class may have been due—whether to a certain undue democratization of historical writing, as some allege, or, as others declare, to the absurd rigidity of the rules regulating employment in the Record Office, which are calculated to create clerks rather than scholars—it is certainly a regrettable fact; for the archivist, with his occasionally irritating attention to minutiæ, brings a useful corrective to the tendency towards hasty generalization that so easily besets historical writers. It is a happy augury for the future scientific productivity of the English Record Office, that of late years two such men have made themselves heard from within it as Mr. Hubert Hall and Mr. Luke Owen Pike.

The reader who goes to Mr. Pike's 'History of the House of Lords' expecting to find a work, as the London *Daily Telegraph* used to say, "palpitating with actuality," will be disappointed. Almost the only material to be found in it directly bearing upon current politics is the account, on p. 386, of Lord Salisbury's scheme for the creation of Life Peers, brought forward in 1888. Mr. Pike justly remarks, from his own point of view as an archivist, that "it would serve no good purpose to mention all the bills which have been accepted in the House of Commons and rejected by the House of Lords." "I could not presume to say," he remarks, "that either house had acted rightly or wrongly. In each case one party might hold one opinion, another party another opinion." He did well, perhaps, to restrict himself to an unadorned statement of legal facts bearing upon the constitution of the House and the qualifications for membership. But, in so doing, one cannot help remarking that it is hardly a history that he gives us; it is rather a sort of expanded chronological table, interspersed with learned disquisitions on such points as whether the Bishops can be described with technical accuracy as Peers of the Realm.

There is a story that when a young Oxford student thought to make use of the statutory promise of the Regius Professor of Modern History to give "informal instruction," and, calling upon him with that intent, ventured, with faltering lips, to express his interest in the early history of the Privy Council, the great Prof. Stubbs cried out: "Oh, I know nothing of the Privy Council; you must ask Dicey." It is, indeed, a thorny subject, on which even so learned a scholar might well hesitate to theorize. The ardent students of the future will have another resource besides Prof. Dicey—they will turn to Mr. Pike's pages; for the origin of the Privy Council is so intimately bound up with the origin of Parliament that our author has taken occasion to go into the matter at some length. We will not attempt to set forth his conclusions here, except to notice that he declares Sir Matthew Hale's old and well-known distinction between the "Concilium Privatum" and the "Concilium Ordinarium" to be devoid of sufficient warrant (p. 44*n*)—a conclusion which some perplexed inquirers will receive with a sigh of relief.

It would not seem beyond the bounds of possibility that some one may yet write a history of the House of Lords which shall be a good deal more than a string of statements properly "documentirt," and yet shall not be open to the charge of partisanship. What ought to be aimed at is an account of the composition and political weight of the House of Lords from century to century, viewed in their relation to the evolution of social classes, together with a comparison of the fortunes of the English assembly with those of upper houses in other European countries. But such an "historian," in the highest sense of the term, will need to get his "dry-as-dust" facts all right before he begins; and for that purpose Mr. Pike's book will be indispensable.

The Humour of Ireland. Selected, with Introduction, Biographical Index, and Notes, by D. J. O'Donoghue. The Illustrations by Oliver Payne. Charles Scribner's Sons. 1894. Pp. xx, 434.

This book is a worthy addition to the "Library of Humour" Series, and is the best collection of its kind that has yet appeared. We might have expected extracts from the writings of Miss Edgeworth and the translations of Dr. Joyce. But we have no desire to quarrel with a selection so admirable and comprehensive. It contains all the best that might have been looked for, and will introduce to most readers many pieces likely to have been before unknown to them. We *are* jealous that in the Biographical Index there is no notice of Patrick Kennedy, who, late in his life, contributed so much to our knowledge of the humorous as well as the pathetic side of Irish story and Irish peasant life. Our collector tells us:

> "Irish humor, properly speaking, is, one may venture to say, more imaginative than any other, and it is probably less ill-natured than that of any other. [This we doubt.] If true Irish humor is not easily defined with precision, it is at least easily recognizable, there is so much buoyancy and movement in it, and usually so much expansion of heart. . . . Irish humor is mainly a store of merriment pure and simple, without much personal taint, and does not profess to be philosophical. . . . Luckily, Irish humorous writers do not attempt the didactic."

To make, within reasonable limits, effective extracts from a book such as this would be difficult. To be at all appreciated it must be read. We cannot say there is any intentional coarseness; but we are occasionally, as in "The Fellow in the Goatskin," and in "The Widow's Lament," led far on the road thereto. There is no true wit and humor in so much praise of drink—particularly to such of us as have had opportunities of realizing the disgrace and ruin that drinking customs have brought to Ireland, perhaps more, proportionately, than to any other civilized country. W. P. French and E. Downey have properly been drawn upon for some of the best specimens of modern Irish wit. A certain topical knowledge is almost essential for their full appreciation. The illustration of a work of this character is a mistake.

While this book lay on our desk, the greatest Irish wit of our day, Father James Healy, parish priest of Killiney in Ireland, passed away. He was the delight of viceregal circles for the past twenty years. Mr. Balfour often sat at his table; Mr. Morley attended his funeral. As none of his bright sayings have yet found place in any permanent collection, we cannot better conclude a notice of Mr. O'Donoghue's work than by quoting a few of them. On one occasion, Mr. Balfour, when chief secretary, said to our priest: "Is it true, Father Healy, that the people hate me as much

as the Nationalist papers say they do?" "Hate you!" exclaimed the priest; "if the people hated the devil as much as they hate you, Mr. Balfour, my occupation would be gone." At a dinner several priests began to twit him on the fact that he was not a more active Nationalist. "It is all very well for you young men," he replied, with a twinkle in his eye, "but one night with my double-barrelled gun in a damp ditch would be the death of me." Dalkey Protestant church, near Killiney, is built on an eminence, the greater part of which, immediately adjoining the church, has been quarried away. Some people were chatting over the neighborhood and its beauties one day, and the site of the church was praised. A Protestant gentleman turned, smiling, to Father James and said, "It is a church founded on a rock." Like lightning came the genial assent, "Yes, a blasted rock." The owner of a great oyster establishment in Dublin was one day telling him of the musical accomplishments of his daughter, when Father Healy, with hearty sympathy, said she would be "a regular oyster Patti." Even upon his deathbed he was ready to give a humorous turn to his condition. "Are you distressed?" asked the doctor, a few hours before the last. "Not at all," was the rejoinder; "on the contrary, plenty of fellows owe me money."

PUBLISHED BY THE CENTURY CO.

MUNICIPAL GOVERNMENT IN GREAT BRITAIN

By Albert Shaw.

A Most Important, Timely, and Suggestive Work.

AT the present time, when the problem of municipal government is confronting the people of so many American cities, no more important book could be put forth than this thoughtful work.

In presenting the facts which he has gathered with so much care, Dr. Shaw says that he has no intention to prescribe European remedies for American maladies, nor to suggest any degree whatsoever of imitation. He believes, however, that we may gain enlightenment from the experience of others. "The art of making and administering modern cities seems not to have engaged the attention of the same order of talent in America that it has commanded in Europe."

Dr. Shaw discusses the sanitary and street-cleaning conditions and laws of the most important cities and towns of Great Britain, including London, Manchester, Birmingham, Glasgow, and many smaller places. He describes how epidemics are met, tenements made less crowded, the city refuse cared for, pipes laid in streets, and treats of electric and gas-lighting, disinfecting, street-sprinkling, swimming-baths, sewerage, markets, fire and police departments, finances, free libraries, parks, etc.

In one 12mo volume, 385 pages, with full appendices, index, etc. Price $2.00. Sold by all booksellers, or copies sent, postpaid, by the publishers.

Pall Mall Magazine

February Number Now Ready.

Edited by LORD FREDERIC HAMILTON, M.P., and SIR DOUGLAS STRAIGHT.

PRICE, 25 CENTS.

The circulation of the "Pall Mall Magazine" is increasing month by month by leaps and bounds. The tremendous success of the now much-sought-for Christmas number has given a still further impetus to the rapidly growing popularity of this superb monthly.

Special Features in the February Number.

Florentine Pictures, by Charles Godfrey Leland.
Tommy Dodd and the Rooster, by Guy Boothby.
The Mud-Coil Indian, by Phil. Robinson.
A Broken Heart, by R. S. Hichens.
In the Library, by the Countess of Warwick.
At the King's Head, by Frankfort Moore.

Besides the above contributions, the Serials by Walter Besant and H. Rider Haggard are still running, both having achieved a great success. There are also many other stories, articles and poems profusely illustrated throughout by the leading artists in black and white. Splendid colored Frontispiece.

The Nation.

NEW YORK, THURSDAY, JANUARY 24, 1895.

The Week.

SENATOR ALLISON is one of the coolest heads on the Republican side of the Senate, and he is evidently convinced that all will not be clear sailing for his party in the next Senate. When Gorman appealed on Monday week for Republican aid in meeting the difficulties of the Treasury and the dangers of the currency, Mr. Allison did not join in the sneer of the smaller minds on his side of the chamber. He said it would never do to wait till next December on the ground that the Republican party, having had an overwhelming victory, was the one to deal with all these questions. It was for the best minds in both parties to come to the rescue of the Government finances at once. This conviction of the Iowa Senator that sound-money sentiment is stronger in the present Senate than it will be in the next, is fully justified by the Senatorial elections in the West and the South. Fiat money will be from six to ten votes stronger in the next Senate than it is in this. The Populists do not expect to have a majority for their ideas, but they do expect to be strong enough to block any measure hostile to their ideas. With no change in the Senate rules they undoubtedly will be strong enough. Good Republican policy, therefore, demands speedy and vigorous effort to relieve the Treasury. Delay is dangerous for the country, but is doubly dangerous for the Republican party. Senator Allison's appeal to his colleagues to treat these great questions in a non-partisan spirit makes him appear to great advantage beside the nagging and do-nothing Aldrich.

The *World* publishes an interview with Senator Sherman on the subject of his bill to authorize the issue of short-time bonds for temporary relief of the Treasury. It authorizes the secretary, in order to meet deficiencies, to sell at discretion for coin, at not less than par, the kinds of bonds authorized in the redemption act of 1875, or coupon or registered bonds of small denomination bearing not more than 3 per cent. interest, redeemable in coin at the pleasure of the Government after five years. In lieu of any of these bonds, the secretary is authorized at his discretion to issue certificates of indebtedness of the United States, payable in coin after five years, in denominations from $20 to $100, to bear interest at 3 per cent. Mr. Sherman says in the interview:

"Some of the New York financial men, who seem to have some funny ideas about finance, take exception to my bill because the word gold is not substituted for coin in the provision for the redemption of the bonds. No such provision has ever been made in Government bonds! There is no reason why it should be stipulated that a loan negotiated under the terms of this bill should be paid in gold. This Government's policy is to maintain the parity of the two metals, and there is no occasion for any such change in the wording of our bonds."

We think that all New York financial men will be grateful to Mr. Sherman for introducing this bill and for his efforts to pass it. At the same time it should be pointed out that the main object of putting the word "gold" into the bill is to make the bonds sell better. That word would certainly improve the price and widen the market. It would create a demand for the bonds in Europe and *ipso facto* stop the exportation of gold. At the time when the bond acts of 1870 and 1875 were passed, there was no other coin known to Congress or the people but gold coin. The silver dollar did not exist. It had passed out of men's minds as completely as the mastodon. The reason why no particular metal was mentioned was because only one was ever contemplated. But be that as it may, the question now is, What phraseology will best accomplish the end in view, to wit, the sale of the bonds at a high price, the restoration of the public credit and of general confidence? Mr. Sherman knows that the word gold will do this, and if he had a little more courage he would say so.

Some of the first fruits of the great Republican victory of last fall, which are now being gathered in senatorial elections in various States, are not toothsome. Platt bestriding the party in New York is scarcely a more astonishing and offensive figure this side the North River than is Sewell beyond it, coolly assuming that his election to the United States Senate is the logical and fitting outcome of the reform movement which swept the State last November. One of his supporters in the caucus pointed with pride to Sewell's "able leadership during the dark days of the Republican party in New Jersey." But it was exactly that able leadership which made the days so dark. Nothing did more to keep New Jersey surely Democratic than Sewell's career as Senator, lobbyist, divider of the spoils under Harrison, and bargain-striker with Democratic bosses. As Senator again, he will be in a position to restore the dark days speedily, and will doubtless do so. He will find able assistance in the Senate, in the great work of clouding the party's prospects, in the person of Elkins, who has solemnly accepted the "great trust" of representing West Virginia. When Harrison made him secretary of war, unutterable things disturbed the mental repose of Republican editors whose minds went back to the star-route days, and the few of them whom Harrison neglected to subsidize frankly said that the appointment was not fit to be made. But now he is a Senator, with a benevolent scheme for old-age pensions for all. Platt, Sewell, Elkins — not to mention Thurston, Wolcott, and Chandler—gayly riding the whirlwind of reform and directing the storm of indignation at Democratic rascals, beautifully illustrate the deep yearning of the American people for pure political leadership.

Platt has succeeded in his efforts to capture the chairmanship of the new Republican county committee, and is now complete master of his party. He controls the State committee, the county committees of New York and Brooklyn, the Republican majority in the Legislature, and apparently the Governor. Such power as this has not been equalled in this State by any boss save Hill. In order to get control of the county committee in this city, he has caused the defeat of the most reputable chairman that the committee ever had, and has put in his place a man who has no other idea of the position than to use it as Platt wishes him to; who was so eager to make this use of it that as soon as he was elected he publicly rebuked the members of the party who had refused to recognize Platt as boss. We are glad to be able to chronicle the fact that several of these resented this insulting treatment by withdrawing promptly from the hall. They ought not to allow their indignation to rest at that point, but ought from this time forward to devote all their energies to showing to the people of this city that there is sufficient manhood and decency left in the Republican party to overthrow Platt and release the party from his control. Unless they can do so there will be a speedy reaction, with the result of putting Hill again in the saddle.

Now that the appropriation for collecting the income tax has at last been voted, the President should lose no time in placing under civil-service rules the collectors who are to have charge of that work. Such action has been urged, we understand, by the Civil-Service Commission, but the answer has been made that, until the appropriation was voted, nothing would be done. The duty is obvious of using every precaution to secure honest and competent deputies to attend to this business. It is an offensive thing at best to have one's private affairs inquired into by a Government official; and in the hands of ordinary political workers, such as would be sure to get the job unless compelled to pass an examination, it would infallibly become a means of blackmail or terrorism, or both combined. We have no doubt that the President will add to his many other recent orders placing new classes of public officers under the rules, one making sure that the character and competence of the income-tax collectors

shall be surrounded with all the guarantees possible.

The case involving the constitutionality of the income tax, now before the court in the District of Columbia, may be thrown out for lack of jurisdiction, or on some other ground, but it is clear that the whole question is to be brought, in some way, before the Supreme Court as speedily as may be. When the case was argued before, the main fight was made on the point that the income tax was a direct tax, and so not constitutionally leviable. This issue the court avoided by ignoring all standard economic definitions of what constitutes a direct tax, and deciding, in what, from the standpoint of an economist, must seem a grotesque way, that the income tax was of the nature of an excise. Doubtless new argument will be had on this point, but apparently the chief stress is to be laid on the constitutional requirement of uniformity in taxation. Mr. David A. Wells has led the way, in his *Forum* article, in calling attention to the possibility that the income tax may be held to be fatally obnoxious to this constitutional provision, and the position which he there briefly indicated will be elaborated and given all possible legal fortification by the lawyers who are to argue the case in Washington. Some of the provisions of the law seem clearly to violate the requirement of uniformity; but whether the whole law will go down on that issue no man can foretell. "We all know what judges will do," said Selden, referring to the judges who upheld Charles's right to his ship-money; and 200 years have not lessened the reasons for wondering at judicial vagaries.

The committee on ways and means has voted to report a bill abolishing the discriminating duty of 1-10 cent per pound on sugar from bounty-paying countries. This duty is considered by Germany a violation of treaty as well as an unfriendly act, and has been made the subject of retaliation of a very annoying kind. It should be remarked, also, that the German bounty on exported beet sugar comes to an end in 1896, in pursuance of a law passed in 1891, so that the matter in dispute is the merest bagatelle in any case. The only importance attaching to it is its irritating character. It is capable of putting both countries into a bad temper and causing severe losses to the citizens of both in consequence. The benefit of the duty is absolutely nil. It is not even beneficial to the Sugar Trust. The Republicans may attempt to make some capital out of the repeal bill, but it is not likely that they will carry their resistance so far as to defeat it. They will say, as Mr. Aldrich does, that the trouble is not caused by the discriminating duty, but by the abrogation of the reciprocity arrangement made by Harrison. But if Germany takes the other view of the matter, the cattle-growers of this country, who are suffering from the retaliation, will not be satisfied with Mr. Aldrich's easy explanation of the trouble. There is no doubt that the repeal bill will pass the House. It is hoped that it may be followed by others for restoring the balance between the Government's income and outgo.

The Hawaiian trouble seems to have no end. There has been a "rebellion" in the islands, which was sure to come sooner or later, and there will probably soon be another. No set of men who acquire power by force and fraud are ever secure against other men's force and fraud. But there is one feature in the situation which to us, at least, gives much relief. Great Britain is still at work with her intrigues. When Admiral Walker wrote home that the wicked Wodehouse was gone, and that the commissioner who succeeded him was abstaining from interference, we greatly feared that the change in policy would lead to trouble between the two powers. American diplomacy achieves little in any part of the world without a British intrigue or two. In fact, it is almost impossible to rouse a right state of mind among our people about any foreign matter without showing that the British are trying to get something away from us. In a certain sense, therefore, British agents are in our service. Their rôle is to excite our public men, and back them up by means of intrigues and grabs. We do not say that we have a right to their service, but we have enjoyed it so long that its withdrawal would indicate a certain unfriendliness of which our people would surely take note.

A despatch of the *Evening Post's* Washington correspondent relative to the Hawaiian business supplies, for the first time, an adequate explanation of all the shrieking and holding up of hands in horror. Up to the present that phenomenon has remained a mystery to its closest students. Hatred of Cleveland and Gresham will account for much, but not for all these hysterical cries of bloody murther so long sustained. Jingoism and the professional enthusiasm of naval officers may go part way in explaining the puzzle, but even they leave us very far from understanding the terrific eagerness to get hold of the Hawaiian Islands. But the moment the trained observer of American politics hears a whisper about Hawaiian bonds, about a syndicate to float them, particularly among the constituents of Lodge, Frye, and Boutelle, about a scheme to make a security now worth twenty-five cents on a dollar jump in one day to par—that moment all becomes clear, and he experiences a joy like that of the man on the peak of Darien when a new planet swims into his ken. He listens, for example, to the horrible racket kept up day after day in the *Tribune* —hears about "the furtive conspiracy, studious deceit, brutal insolence, and defiant usurpation" of Mr. Cleveland, closing with the despairing question, "With what miracles of infamy will he consign the chapter to a hideous immortality?"—and is no longer baffled thereby. Over nothing but bonds can such a divine rage be stirred up in this country. Bonds, a syndicate to float them, large holdings among the truly pious investors of New England who want to make only 300 per cent.—the whole thing is a mystery no more, and takes its place alongside Landreau claims, nitrate beds, "good things" in Brazil, and the other historic evokers of American patriotic frenzy.

The bill for reorganizing the navy which is soon to be brought before the House of Representatives for consideration, is such an extraordinary measure that it is difficult to regard it seriously. It is entitled "a bill to reorganize the efficiency of the personnel of the navy and marine corps of the United States," but that is a very misleading title. What it does is to increase the number of captains from 45 to 60, and the number of commanders from 85 to 100; to make 23 commanders who came in from the volunteer navy during the civil war additional in their grade, with promotion the same as now; to create a reserve list (a new departure in this country) of 100 officers, in addition to the present naval establishment; to make all the present commodores admirals, and to permit the seventy-eight line officers who have had thirty-five years' service, to retire as rear-admirals on $4,500 a year each. The increased expenditure for the additional commanding officers would be $100,000 a year, and the reserve list would require an increase of $250,000, making an annual increase of $350,000 in two items alone.

The absurdity of the bill is most strongly disclosed when we come to inquire what use is to be made of the 53 additional commanding officers. There are now 45 captains and 85 commanders, or 130 commanding officers in all. At present only 38 can find employment, and of these only 25 are in command of sea-going ships. A greater number than forty vessels available for sea cannot be expected in the near future, counting ships now building and those proposed to be added. At present no captain can get command of a ship more than one-third of his time, and three years of sea service in ten years is very rare. If now 53 more officers of command rank are made (as the bill provides), and we have 183 for forty ships, they will then remain on shore 75 per cent. of their time, or *eleven years after each cruise*. It is the professed design of the bill to abolish "stagnation" from the navy and promote efficiency

among the officers. But how can efficiency and habits of command be promoted among officers who spend three-quarters of their time on shore? The "stagnation" would be greater under the new system than it is now, and there would be a demand for its banishment by building more ships, giving us a "great navy."

The experience of Brooklyn during the past week shows the dreadful mistake which officials make when they temporize and compromise. After the strike had gone on for a full week, after the strikers had found that the local authorities, if not openly sympathizing with them, were at least most derelict in enforcing the law, after the inefficient management of the police force under an incompetent commissioner had forced the calling out of 7,000 troops—after all this, Mayor Schieren announced on Monday that now "all nonsense must be stopped." If the chief magistrate had taken this stand a week before, there would have been no occasion for expending $15,000 a day ever since in maintaining the great military force now on duty. The time to "stop nonsense" is when it begins—not after it has been given a week's headway. The demagogues are now condemning the companies because they have not secured a full force of new men to operate their cars. But how could this be expected when the new men who were sent out on cars last week found that the very policemen who accompanied them were unwilling to protect them from violence, and were in many cases openly displaying their sympathy with the law-breakers?

The Ohio wool-growers have resolved that the free-wool provisions of the new tariff are "a colossal political crime." This seems to us a mistake. In the first place, it will stir up the wrath of the silverites. They hold the copyright in the phrase "a colossal political crime." By a long-vested right, *that* applies only to the demonetization of silver in 1873, and any other crime that attempts to usurp the proud title will do so at its peril. Besides, it is hardly polite to tell the men—and particularly the women—who are buying better clothing for less money than ever before in their lives, that they are accessories to a crime. Nor will the woollen manufacturers, whose mills are doing better than for years, be pleased to be told by the men whose wool they buy that they are benefiting by a crime. It would be just like them to knock off a cent or two on the price of wool when thus taunted. Furthermore, the market reports for Boston, New York, Philadelphia, and Chicago are all telling just now of a firmer market and higher prices for wool. We think that the Ohio growers, on mature consideration, will leave to Stewart and Teller sole and undisturbed enjoyment of the only original "colossal political crime."

The Boston *Journal of Commerce* notices the removal of New England cotton mills to the South with approval and without any feeling of alarm. The movement, it says, is simply the transfer of coarse goods to a more economical situation, to be replaced by fine goods in the northern centres of the trade. As fast as the old machinery in Lowell, Lawrence, Nashua, and Manchester wears out, or becomes antiquated, it will be cast aside and not renewed—that is, not for the same kind of goods. The room will be taken by new machinery for new goods, and the same companies will erect mills at the South for making the coarser fabrics. This is what is going on now. "This change," says the *Journal*, "will not displace a single operative, but will call for a more skilled class of help and eventually a larger number, as a weaver cannot tend the same number of looms on fine goods that she can do on coarse."

Kansas has learned by bitter experience the worthlessness of the Populist nostrums for the cure of hard times. While that party was in control of the State, it passed a law to regulate the sale and redemption of real estate under execution, which it was promised would afford great relief to those who had mortgaged their homes and were unable to meet their obligations. Under this law the borrower, without paying interest or taxes, can retain control of the property pledged for security two or three years, instead of being subject to foreclosure in the usual way. But instead of relieving the borrower, this interference with normal business relations has made his condition harder than it was before. Capital was alarmed by the passage of the law, and was withdrawn as rapidly as possible from the State. It is estimated that $15,000,000 has been thus withdrawn during the last two years by Eastern men who had loans secured by real estate in Kansas, while nearly all the large insurance companies and savings banks which have been accustomed to make loans there positively refuse to take any new mortgages until the laws are changed. Gov. Morrill, who is a practical business man, in his first message to the Legislature urges the prompt repeal of this foolish statute as the first essential to the return of prosperity.

Senator Dolph of Oregon makes a good many tiresome speeches, but his renomination by the Republicans of the Legislature is cause for rejoicing. He has stood out against free coinage, and the silver lunatics resolved to set him aside for this reason. The complete failure of the attempt shows that the craze is fading out in Oregon. The Portland *Oregonian*, which has fought the delusion persistently and forcibly, takes a hopeful view of the silver question. It points out that there is no longer any silver craze east of the Mississippi River, and it attributes its continued vitality further west to the "desperate speculators who have blown everything into silver mines and become political desperadoes." These have played on the cupidity of other politicians and on the ignorance of the masses who feel the stress of the hard times, but the silver fanaticism which they thus foster, in the *Oregonian's* opinion, "will not be of long duration."

The worst feature of the situation is the fact that, while the people may soon recover from the craze, its influence cannot be so speedily extirpated in Congress. A free-coinage Senator is elected to serve for six years, and he is generally a man who will remain "true to silver," however his constituents may change. Wyoming, for example, recently elected such a Senator to serve until 1901, in place of Mr. Carey, who voted against free coinage. Utah will send two Senators of the same type when she enters the Union as a State next winter. Arizona and New Mexico can be depended upon to furnish four more votes in the Senate on the same side in the Fifty-fourth Congress, if the acts providing for their admission are passed during the present session. The compact body of silver Senators from thinly settled and remote States is out of all proportion to the strength of the craze in the country at large, while it is impervious to the force of public opinion in the populous parts of the nation. This is the most serious element in the situation as regards the future of this question.

French finances are in a situation only less critical than our own, and it is to be feared that the great stir over the dramatic political events of last week will prevent the Chamber and the country from giving the subject the serious consideration which it demands. M. Paul Leroy-Beaulieu published on January 12 a long exposition of the difficulties confronting the Treasury. These may be summarized as an enormous permanent debt, actually doubled during the past twenty years of peace; a floating debt of proportions which are a little vague, but very bothersome; diminishing revenues and Treasury balances; huge and increasing appropriations and wastefulness. On this last point M. Leroy-Beaulieu makes the following truthful assertion, applicable not alone to France:

> "There has been much talk of late of different bankruptcies; one may add to them the total bankruptcy of the old claims of democracy that it would reduce the numbers of public officials. In point of useless offices and sinecures, democracy has surpassed all preceding forms of government. Not a single sub-préfecture has it abolished, or got rid of one hanger-on of municipal councils, while it has created legions of directors and inspectors of all sorts."

England is as badly afflicted as France with the disease of "fonctionnarisme,"

NEW YORK'S NEW RULER.

THERE is one branch of the subject now engaging every one's attention, which has hardly been touched on, but which merits the earnest attention of the Committee of Seventy and of the Good Government clubs, and indeed of all good people in this city. We mean the fact that we are now contending, not simply with the venality and cunning of Platt, but with what is really a new form of government established by Croker, whose successor Platt is. If we treat the present situation as simply one of Platt's making, and flatter ourselves that, if we beat Platt, our way is clear, we shall make a great mistake, which the new generation will rue; for unless we carry our reform further than the rescue of the city from Platt's hands, Platt will have a successor, as Croker has had.

Croker has established in New York a government unknown to the Constitution and the laws, but just as effective as if it had been discussed in convention and voted on by the people. It consists in the levy of money on the corporations of this city, with which the legislators are purchased before their election by one man resident in New York, who then retails legislation in quantities to suit purchasers either for cash or for salaried offices.. So firmly is this form of government established to-day that no legislation can be obtained in any other way, no matter who demands it, or what plain public necessity calls for it. Platt's government is, in fact, as strong as if he held the State with a victorious armed force. He feels towards the Mayor, the Chamber of Commerce, the Committee of Seventy, and all other public bodies, as Louis Napoleon might have felt towards those of Paris after 1851. He rules the State more fully and completely than the Governor or any public officer. The Governor, in fact, sits as his deputy.

If any one had foretold, twenty or even fifteen years ago, that any such régime could be set up in this State, that the public powers could pass into the hands of a private individual without any popular mandate or recognition, he would have been laughed to scorn. If any European observer had predicted it, he would have furnished materials for ridicule in a thousand newspaper articles. Nevertheless it is to-day the most prominent, notorious, and grievous fact of our political condition. The system, too, was founded by an ignorant man of foreign birth, once a street "tough," and practised by him for several years—with complete submission on the part of the people at the polls. Moreover, he struck its roots so deeply that, when his party was defeated at the polls, he was succeeded in his place, quietly, naturally, simply, by an American, home-loving, God-fearing Presbyterian, with a pastor and a pew.

Now we happen to feel this yoke most severely in the city because it is here the money is raised for the public degradation, and because it is here that we need most legislation. The country as a rule does not feel it in anything like the same degree, and in fact it is the country legislators, for the most part, who serve under Platt in the new bossocracy, as we should call it, but more properly autocracy. It is a régime which cannot be overturned by voting against Platt, for he holds no legal office, nor can we probably produce much *permanent* effect on the legislators now in office, for they are in his pay. We therefore most earnestly urge on our friends who are working for reform in this city to appeal more fully and directly than they have yet done to the people of the interior of the State. We do not believe these people are fully aware of the nature of the system Platt has set up, or of the subserviency of their legislators to him, or of the effects of his rule in this city. We would therefore suggest an address to the voters of the western part of the State, on the part of the Committee of Seventy, describing the situation here, as created by six years of Tammany rule, setting forth the pledges and promises made to Democrats and Independents in order to secure the election of a Republican mayor, and the difficulties thrown in the way of reform by Platt's government.

None of the New York city papers has much circulation one hundred miles away from the place of publication. As we have seen, Platt supplies the papers of the interior, by direct distribution, with his own version of the trouble, and no counter version ever reaches them. Very few indeed of the country voters have more than a vague idea of the difficulties with which we are contending here, or of the problems of city government which have come up within a few years. But few have ever seen any report of the evidence taken before the Lexow committee, and they will therefore readily believe the Platt theory of the report, that the whole trouble was due to the superintendent's lack of power to make transfers and assignments. In fact, not many know more about New York than that it is a great wicked city, controlled by "the money power." What is needed is a vigorous and abundant distribution of readable documents, for which every kind of lists should be used—clerical, medical, collegiate, reform and tariff clubs. The city is and must remain controlled by the Legislature, and if the old government by discussion is to be restored, it must be through the people who elect the legislators.

This method of working on opinion has never yet failed in America. It may be slow, but it is sure. If we ceased to believe in it, we should have to give up popular government as a hopeless failure. It must be remembered how short a time it is since Hill seemed as strongly entrenched as Platt, and what serious doubts many of us felt as to what the popular verdict on Maynard would be. Now the people who ousted Hill and damned Maynard are not going to put up with Platt if the facts are well laid before them. They are as a general rule Americans, who think the State of New York the best "organization" any man can belong to, and who will not tolerate the boss system one minute after they fully understand it. This system cannot be overthrown, however, without a vigorous propaganda, which we earnestly commend to the attention of all who have "enlisted for the war."

THE LEXOW REPORT.

CONCERNING the narrative portion of the Lexow committee's report we have nothing of moment to say. It describes fairly enough the revelations which have been made about the condition of the police force. But we do not remember ever to have seen, in any public document, a passage equalling in audacity the following explanation of the cause of the police demoralization:

> "The conclusion seems irresistible that the bi-partisan system is the only one which can commend itself to the people. The main evil to be corrected is that of the prevalent demonstrated corruption, which apparently, from the testimony of the superintendent, has swept into the force *mainly because of the inability of the executive chief to assign and transfer members of the force.* He testified that if this power to assign were conferred upon the superintendent, and conditions such as revealed by the testimony continued, the superintendent must either be corrupt or incompetent; hence, absolute responsibility could be fixed for such a condition of affairs."

So that our rising in November was due solely to a desire to give the superintendent the power to "assign and transfer" members of the force, under a bi-partisan commission, and this is really the only change for the better the committee offer us. It must not be forgotten that the evidence taken by the committee was not taken in secret. Every word of it was laid before the public, so that there are probably 10,000 persons in this city fully as competent as any member of the committee to draw conclusions from it. Every one of these may fairly consider his intelligence insulted by the proffered remedy.

The arguments in favor of a bi-partisan commission are, in like manner, apparently addressed to an audience which has never had any experience of a bi-partisan commission, and indeed has never seen one. No one would suppose, from these arguments, that the city had had twenty-five years' experience of such commissions, and was perfectly familiar with their defects, and that their possible corruption and rascality had been fully exposed before the committee itself; that a bi-partisan of one party had in their immediate view and presence been proved guilty of selling promotions, and left the chair in shame and "mental prostration," and that another bi-partisan of another party had in the same place admitted himself to be

a "grand-larceny thief." They do not, in fact, contain an allusion to the long history of the bi-partisan system as we have tried it, or attempt to meet one of the objections to it. To the suggestion that the management of elections should be transferred to a separate bureau, the committee simply opposes the assertion that "it would not relieve the situation in respect" to the multiplicity of police functions at present, which is like saying that it does a busy man no good to have his work reduced. The argument against a single head for the police consists simply of the assertion that he would have too much to do.

Let us now examine the committee's remedies. In the first place, they provide for the reorganization of the force by three commissioners appointed by the Governor—not by the Mayor. The Governor is now, to all outward appearance, under the influence and control of "Tom" Platt. These three men would, therefore, probably be Platt men, and they are to have power to examine into the qualifications and efficiency of every member of the uniformed force, and dismiss or retain whom they please. It is true that they are to submit their decisions, with the reasons for them, to the Mayor, and he is to have the power of approving or disapproving them, and his judgment is to be final; but the Mayor cannot, of course, pass intelligently on the qualifications of 4,000 men on the report of persons whom he has not selected, and in whom he may have no confidence. The Mayor, and no one else, should have the appointment of these commissioners. This is what the election of last November meant.

The government of this reorganized force is to remain exactly what it is to-day—that of four "bi-partisans," two of them, we presume, Charley Murray and Mike Kerwin, whose appointment Platt got from Mayor Gilroy, he said in an interview, "by diplomacy"; and bi-partisans they are, with all that the word implies. The only change is, that bi-partisanship is made mandatory on the appointing officer, and the superintendent receives power of assignment and transfer, and of suspension for ten days. Promotions are to be made by the board—no longer by civil-service examination—by *unanimous* vote, unless the superintendent should recommend in writing. Otherwise any one member of the Board could block a man's promotion, and the bi-partisan who would not, under these circumstances, make the officer pay up, would differ greatly from most other members of his species.

Now we should like to ask the Committee of Seventy, Dr. Parkhurst, Mayor Strong, and every other honest man and woman who worked and prayed last fall for the deliverance of the city from the clutches of a corrupt bi-partisan oligarchy, whether they are prepared to sit down under this most impudent attempt on their simplicity and credulity. They are virtually asked in this most ridiculous report, by the aid of arguments which would discredit a schoolboy, to exchange the rule of a Tammany boss for the rule of another boss whose methods are exactly the same, whose character is very little better, and who is just as eager to maintain partisanship in city government as Croker was. Platt is determined to-day that we shall not have what we voted for in November, and that he, who could not poll 5,000 votes for any office in this city, will "down" Mr. Strong, who polled 154,000.

If there be any of the courage, the persistence, the determination to deliver the city which were displayed at the last election, left among us, the time has come for a second display of them. We are betraying no confidence when we say that the delay in the passage of the removal bill is due simply and solely to a desire to extract pledges or conditions from Mr. Strong as to the appointments, and that Mr. Strong's determination to accept no resignations and make no appointments until this bill is passed, is part and parcel of resolute resistance to Platt's dictation. The "three-bill trick"—that is, the introduction of several bills with the same object—is merely a device of the thimble-riggers who serve under Platt to produce delay and give the committee on cities an excuse for many "hearings" and much mock deliberation. But Mr. Strong must not be left to fight this battle alone. Those who elected him must back him up. They must speak out. Platt must be made to understand that, in the language of his brother-sharpers, the people of the city "have got on to his racket." The Committee of Seventy, the Good Government clubs, the City Club, and every organization and order of men and women in the city should make plain that their tenacity and their vigilance are at least equal to those of the public enemy.

SUNDAY CLOSING.

Mayor Strong, in his interview with the liquor-dealers the other day, threw out an intimation of the change which is rapidly coming over the minds of thoughtful men of all classes, concerning the wisdom of the attempts we have been making for so many years to enforce in New York the New England view both of the Sabbath and of liquor. Among them are a great many of those who for years past have been foremost in the efforts made to diminish drinking in this city, and to surround what drinking there has to be with conditions of decency and order. Upon these the argument of experience ought to tell with great force, for in politics and legislation there is no guide like experience. It is worth all the books, sermons, and lectures in the world. The sociologist and the politician both have to stand dumb before it. Happy is the people which has a good stock of it in store, for, as Burke remarks, what is not practicable is never wise. We are not now talking of the regulation of the liquor traffic by high license or otherwise. We are talking of the closing of the saloons to the workingman, on the only idle day he has in the week, in defiance of the wishes of the majority of the city population. The attempt to do this has been persisted in for a quarter of a century. We know all about its history and results, and can therefore speak about it with a confidence which would hardly be justifiable on any other public question.

In the first place, as long as the workingman votes, his opinions in this matter, whatever we may think of them, must be respected. He will find some means of making them tell. Although he may not be able to make head against a law made at Albany, he can exert a powerful influence on the manner of its execution. In this city our Sunday restrictions have simply thrown him into the arms of Tammany, as a power which will permit the law to remain a dead letter. To nothing more than this does Tammany owe its solid vote of 108,000. It cannot do anything for one-tenth part of these people, except contribute in some small ways to their comfort, and this it has done. It has winked at such violations of the law as the working-people had a mind to.

The explanation of this will be very easy if we put ourselves, or try to do so, in the workingman's place when he wakes up on Sunday morning. He lives in one or two squalid rooms in a tenement-house, and he has a vacuous day before him. He does not go to church, and he is not a reader, even if he had books. He is essentially a talker. All he knows of the outer world comes to him through talk, and the one place in which he can talk or discuss with his fellow-men, and under conditions of comfort, is the saloon. He might go to a coffee-room here and there, but there are not enough coffee-rooms in New York for a fiftieth part of the saloon frequenters. The saloon, too, is the one place where he comes in contact with the civilization of the community, with its ideas, or views, or facts. Moreover, whatever be the right or wrong of it, the great bulk of our population will not sit and talk without some kind of intoxicating drink before them. In this they resemble almost the whole population of Christendom, except native Americans who do their drinking standing. What makes the matter worse is that those who denounce and try to change the workingman's tastes in this matter generally live in comfortable houses and belong to clubs, where every hour of Sunday, as of other days, they can order whatever drink they please without hindrance or criticism from anybody. The notion that the working classes do not take note of this when they are breaking the law, is an hallucination. It is constantly in their minds.

In the second place, no machinery for enforcing such a law as our Sunday closing law has ever been devised. No such attempt as we are making has ever suc-

ceeded anywhere any better than here. No police would be equal to such a task even if it were honest. But no police can remain honest which is charged with the duty of preventing any kind of dealer from satisfying a keen, and generally considered legitimate, popular desire. Under such temptations the virtue even of clergymen would in the long run break down. On this point any citizen of New York is one of the highest authorities in the world. We have seen a police force, exceptionally well paid, and probably at the outset as honest as any, become in twenty years, under the operation of constant temptation, an army of brigands and blackmailers. We have seen every liquor-dealer of about 10,000 furnished with a keen inducement to break the law and to escape the penalty by bribing the police. The result has been that the law has not been executed, and its non-execution has been secured by wholesale corruption. Nor is there any use in supposing that we could execute the law with better material. No material is within our reach which would answer any such purpose. Twelve-hundred dollar policemen have not done it, and five-thousand-dollar policemen could not do it. To secure complete prevention we should have to pay salaries large enough to take away the desire for small additions to them. What should such salaries be? The police commissioners get $5,000, apparently without taking the edge off their appetites.

To keep on trying to save Sunday from what good people consider "desecration," by such means as these, and with consequences with which we are now familiar, would be something far worse than a mistake. It would be doing a great wrong for a little right. It would be debauching the whole government of the community in order to prevent a few people from making a harmful use of their liberty. Nothing that we are now saying applies to any regulation of the liquor traffic by license or otherwise. It applies only to the Sunday prohibition. It applies only to the attempt to enforce a law to which the great bulk of the community is opposed. A high license would make every liquor-dealer who held it an agent of the law in preventing illicit traffic and in keeping down the number of saloons. A Sunday law converts every liquor-dealer into an enemy of the law and a debaucher of the police. We advise those who are interested in the peace, order, and morality of the city not to be influenced by the denunciations of those who seek its repeal. Standing on the revelations of the Lexow committee, and on the experience of the last twenty years, they may defy the *à-priori* hosts.

THE FRENCH CRISIS.

THE Latin poets say that crossing the sea does not change people's characters. So also it may be said that no change in the form of government can effect much change in French political manners. The Presidents of the Republic seem to have hardly any better chance of filling out their terms than the Kings and Emperors. Louis XVIII. is the only ruler in one hundred years who has died peaceably in possession of power. MacMahon, Grévy, Carnot, and Perier have followed Charles the Tenth, Louis Philippe, and Louis Napoleon. The resignation of M. Perier may be considered the final breakdown of the experiment which the French have been trying since 1871, of combining an elective presidency with a ministry responsible to the Chamber. It becomes more and more doubtful whether any of our modern democratic parliaments can be much longer intrusted with the power of changing the executive by a hostile vote. What has just occurred in France is what is becoming more and more frequent in all chambers in which the ministry need to command a majority vote in order to stay in power. The "group" system of organization is making such majorities more and more unstable, and it is characteristic of the French to push this group system to its extreme, though the Italians are following fast in their wake, as are the small states of eastern Europe. There are signs of the same tendency even in that "mother of parliaments," the English.

The economical condition of France, too, greatly favors the friends of disorder. She has for a hundred years led the van in the embodiment in practice of the ideas uppermost in the European mind. The spread of universal suffrage has filled the masses with the expectation of some great improvement in their material condition, for his material condition is everywhere the foremost object of the poor man's thoughts. The general depression in business, combined with the continued existence of poverty, has set him to asking more and more imperiously when the improvement is going to begin. All the European governments, at least all the parliamentary governments, pretend that the question is quite reasonable, and that the improvement ought to begin at once. Not one of them, however, seems to know how it is to be effected, and they try to gain time by appointing "labor commissions" and making recommendations of attractive but visionary schemes.

Unhappily, in France this question is addressed to a body on whom the modern eagerness to grow rich has taken powerful hold, who get into the Chamber largely with the view of improving their condition, and who insist on the ministers purchasing their support; and they find themselves in power at a period when the capital is full of speculators and promoters, who stand ready to buy everything that is for sale. Hence the enormous scandals of the past few years, which have furnished the Socialists with plenty of ammunition for the "dénigrement" of the "classes dirigeantes," and, in fact, of the owners of property generally. There is unquestionably, in the detestation of the Socialistic workingmen for the "sale bourgeois," a strong element of contempt for his supposed venality and corruption.

Though last not least, among the difficulties with which M. Perier has had to contend is the Parisian press, which recent revelations show to be venal beyond example, besides being violent and mendacious. There are really only two daily papers in Paris worthy of the attention of a serious man. But then the press in every country fairly represents the public which reads it. All pecuniarily successful newspapers supply a demand, and it may be fairly said that the Parisian public makes the Parisian newspapers. What is peculiar in the journalistic situation there, however, is that the papers which in other countries would only amuse people by their lies and extravagance, in Paris make an impression on the public mind, and they make it even if they live only two or three weeks. Few Parisians have what we call political sense, or even "horse sense," and their credulity in the matter of scandal is worthy of the middle ages. Hence it is possible for a parcel of adventurers at any time by a few weeks of "journalism" to cover a ministry or a public man with odium of some sort, which the French temperament makes it impossible for any one to sit down under or to despise. The sum and substance of it all is, that public life in France is becoming increasingly difficult for real statesmen, and the confidence of the masses in politicians is steadily decreasing. Taine points out that when this general relaxation of the social and political bond occurred after the Revolution, people turned in despair to the army, where the virtues on which states are founded had taken refuge—the feeling of brotherhood, of obedience, of mutual confidence and loyalty, of love of country; and it would not be surprising if we should now witness the same phenomenon.

The Socialists, who were shrieking with delight on Wednesday week, when they had frightened a hypochondriac President into resigning, were howling with rage by Friday over the election of M. Faure, another Conservative chief magistrate. A most curious feature of it all, to an observer at a distance, is the comparative quiet and indifference of the country at large while Paris is torn with fury and faction. The explanation of this fact appears to lie in the massing of the Socialistic sentiment and vote almost wholly in Paris and a few large cities. Reckoning the entire Socialist vote of the country at something more than 500,000, fully one-half of this is cast in Paris alone, while probably nine-tenths of the remainder comes from Marseilles, Toulouse, Roubaix, and other cities. As it happens, some scattering elections, held no longer ago than January 6, give a very good idea of the distribution and location of the dangerous constituencies. In a Paris arrondissement on that day, a Socialist, M. Gérault-Richard, was elected to the Chamber by a vote of 2,742 to about

1,200 for all others. His predecessor, also a Socialist, had been elected by 3,041 to less than 2,000 for all others. But on the same day, in one of the districts of the Côte-d'Or, a Moderate Republican was returned by a great majority, while in an election to the Conseil Général du Rhône the Socialist vote was only 574 out of 3,908 cast. These figures help us to understand how little typical and representative of the nation the political sentiment of Paris is, and how the Parisian mob is powerless to elect a President, even if it can harass and intimidate one when elected.

Indeed, the Socialists themselves confess the almost entire failure of their propaganda among the peasants. Even M. Jaurès acknowledges this, and has insisted upon the need of getting up a more showy bait to make the wary rural voter rise. The explanation is, that the French peasantry of to-day is a property-owning peasantry. According to the estimates of Miss Betham-Edwards, who is a high authority, twice as many French peasants owned land in 1889 as in 1789. The land of France is owned, so it is computed, by 8,000,000 persons, of whom above one-half are peasants. This is one of the great results of the French Revolution which must be duly weighed in reckoning up the good and evil of that mighty convulsion. It at least broke down the feudal land-laws of France, and made land-owners out of millions of men who were serfs. In their hands has been demonstrated afresh what Arthur Young called the magic power of property to turn sand to gold. Regions which he visited in 1788 and found barren and deserted, a hundred years later were clothed with vines and gardens under the tillage of peasant proprietors. Is it any wonder that these men propose to think more than twice before consenting to give up their hard-won property ?

VENETIAN ART IN LONDON.

LONDON, December 29.

THIS year Venetian art is the subject which the directors of the New Gallery have taken upon themselves to illustrate in their winter exhibition. That in the private and lesser-known galleries of England many good, and a few important, canvases by the old Italian masters are to be found, is a fact that need not now be insisted upon, since it has already been well established by the collections hung winter after winter in the Royal Academy. Of course, it is only in Venice that Venetian art is to be seen in its full glory, but there was every reason to suppose that such a loan exhibition, got up in London, would prove interesting if only in a supplementary way.

And interesting it is unquestionably, though also disappointing. Without the journey to Venice, without, indeed, crossing the Channel, finer examples of Venetian art can be found. At the National Gallery, in the British and South Kensington Museums, the subject is to be studied to much greater advantage, with far fewer drawbacks. Besides, some of the noteworthy contributions come from other collections open to the public—from Hampton Court, for instance, and Oxford's University Galleries. Still, the opportunity to pass in review the art of Venice in almost all its periods and branches (there are laces, bronzes, books, armor, glass, porcelain, and so on, as well as pictures and drawings) in one exhibition is exceptional, and therefore of no small interest. The disappointment is to discover how far short all the sections, save perhaps the one devoted to lace, fall of being fully representative of their art at its best.

To consider the pictures first is inevitable, since to them by far the most space is given. They fill the three large galleries and the balcony. Like all old work, mellowed and softened by time, they lend a certain serenity and repose to the walls they decorate, and, as all belong to practically the same school, there is little to disturb a harmony that has much of splendor in it, beauty and richness of color being the chief characteristic of the school in question. But when it comes to looking at each canvas separately, the effect is not so striking, for there is no doubt that, judged from the artistic standpoint, many of the paintings are of no value whatever—mere rubbish, to be frank—while the masterpieces are few and far between. Indeed, the catalogue in itself is enough to make one distrustful. It contains no less than thirty Titians; and fourteen examples of Giorgione, despite the experts who have denied his right to all canvases bearing his name save the one solitary Madonna. However, if the quality of the work were beyond reproach, the vagaries of tradition and catalogue-makers would matter little. But, as it is, there is painting after painting that can be taken seriously only by those authorities and students who measure art with a foot-rule, reducing it to a problem of noses and finger-tips, who set up photographs as the standard, and who unearth forgotten painters to make them play the scapegoat for their fellow-artists. The chances are that before the exhibition closes, the most glaring absurdities of the catalogue will be amended, and pictures will be labelled anew to the satisfaction of the labeller and the dismay of the owners. But, so far as the work is concerned, it will be in the end exactly as it was in the beginning, with no greater claim to distinction, with no greater power to enchant. Those who value pictures according to their artistic qualities will still look at the many with indifference, will still feel the same keen pleasure in the few.

Here, in fact, as in all collections and exhibitions, there are the few good or even great exceptions. The Primitive commands respect when he is seen in such a careful record of architecture and facts, rendered with unmistakable regard to color-schemes, as Jacopo Bellini's "Dominican Preaching in a Public Square"—a rose red square of Venice ; or such a fine decorative arrangement as Crivelli's "St. George and the Dragon," though one wonders if it was as beautiful when the now old gold of the backgrounds and the saint's armor and the horse's trappings was as new and staring as the frame that holds it. A Mantegna or a Carpaccio here and there reminds mildly that the true artist was never bound to commonplace by the accepted conventions of his time. The name affixed counts for nothing when a portrait is as stamped with individuality as two by Gentile Bellini of youths shown in severe profile against a plain ground, from the Oxford Galleries; or the good strong head of Hans Memling by Antonello da Messina; or another of a handsome Venetian by Giovanni Bellini. These are works in which the individuality of the painter and the men they painted is triumphantly asserted. And the same individuality, together with greater facility of execution and more matured methods, distinguishes the portrait of a melancholy, sad-eyed, long-bearded man by Moroni, not unworthy to hang side by side with the "Tailor" in the National Gallery; the beautiful "Andrea Odoni," from Hampton Court, by Lorenzo Lotto; Tintoretto's old and wrinkled "Venetian Senator"; and the "Portrait of a Man" by Giorgione—a small head, lent by Mr. A. H. Savage Landor, which, genuine or not, is very lovely in the subtle modelling of the face and the richness of the subdued color. The famous "Shepherd with a Flute" from Hampton Court is also here, and among the twelve other pictures attributed to Giorgione there are two or three—notably a delightful little sketch, nothing more than a fine note of color, "The Rape of Europa," lent by Burne-Jones—which stand out with much distinction in their present surroundings.

The thirty Titians are mostly tributes to the unintelligence of the collector; the well-known "Triumph of Love," and a less familiar "Mother and Child"—which ought to set the Morelli faction in a flutter, so unlike is it to other Titians—offering the necessary contrast. Perhaps I should add that "The Worship of Venus," the replica of the beautiful Prado picture, sold not long since at Christie's, is here, and also the "Portrait of Antonio Grimani," that scarce justifies the raptures of Crowe and Cavalcaselle. Tintoretto fares more fortunately, for there is an "Adam and Eve" to show how tender and scholarly he could be in the treatment of the nude, and likewise an allegorical "Portrait of Ottavio da Strada," to charm by the exquisiteness of color and grandeur of composition which were his in his happiest moments. Only a hint is given of Veronese's decorative elegance in the "Christ at the House of Levi," a replica on a smaller scale of the picture in Venice ; only a suggestion of the stateliness of Tiepolo, who is most inadequately represented. If two or three Guardis and Canalettos, and a single canvas by Il Greco—as pupil of Tintoretto included among the Venetians—were mentioned, the list would be fairly well exhausted.

The average of the drawings, no doubt because of their comparatively small number, is higher. Of course, many are the merest sketches and notes jotted down roughly, if with delightful vigor. But then, again, others seem to contain the most complete and perfect expression of the artist's skill. Thus, there are drawings of single figures by Carpaccio, done in bistre heightened with white on gray paper, which have all the dignity and grace of the figures in his pictures, suggest far more action, and are marred by none of the archaic mannerisms which the painter of his day could not escape when he came to work out an elaborate composition in color on canvas. The red-chalk studies attributed to Giorgione, in like manner, gain in vigor because of the entire freedom with which they are made. It is curious to contrast the rapid pen-and-ink drawings by Titian, no more than hurried memoranda, with a most delicate, careful drawing of "The Adoration of the Magi," wonderfully dainty in its detail, by Antonello da Messina, or a tiny little head of a man by Giovanni Bellini, in which he has anticipated something of the modern mastery of this medium. Pen-drawings by Campagnola are amusing in their way, while the wash-drawings of Canaletto are as clean and crisp as if destined for the modern reproductive engraver. Another sug-

gestive drawing is one of "Ladies and a Dwarf under a richly decorated pergola," by Veronese, from the royal collection—suggestive less because of the way it is done than of the power displayed to express on a small piece of paper the stately architecture which we have come to associate only with his colossal canvases.

Of the rest of the exhibition it would be useless to speak in detail. The lace is very beautiful, and includes some fine old Greek Venetian, the figures in the design being quite Byzantine in character. For embroideries and stuffs, however, a visit to South Kensington would prove more profitable. The book-bindings are exceedingly well selected; the tooled morocco bindings done for Grolier and those in crimson velvet and gold for the Popes, and in repoussé silver for the Doges, receiving due prominence. But it irritates to find that of all the arts relating to the making of books, the art of bookbinding alone is recognized. What, one cannot help asking, of the work of Aldus, of Ratdolt? The glass and porcelain do not compete with the British Museum collections. There is a strange absence of good brasses, and while armor and lanterns and mirrors may be decorative, they leave many a gap that a well-equipped museum could easily fill. Altogether, if the exhibition be useful, it is within certain very circumscribed limits.

N. N.

RECENT ITALIAN NOVELS.

ALASSIO, December, 1894.

OUT of four volumes before me, three treat almost exclusively of the one subject, the one that serves for nine-tenths of the novels of the Latin races. One must accept the convention, just as we expect others to put up with the bread-and-butter loves, the scruples and principles, of the misses of our novels. It is said that people who are brought up under a more carnal régime get to loathe the insipidity of the misses; it follows as naturally that the most cosmopolitan among Anglo-Saxons sickens of a too protracted contemplation of the unholy trinity. So if, after a dozen or more of stories of Matilde Serao, and five hundred pages of Gabriele d'Annunzio, full of illicit animalism, my remarks should at times be sharpened by an injudicial impatience, the reader is begged to make due allowance for a frailty that is yet imperfectly corrected by education.

Matilde Serao's two dainty little volumes are written to make a pair. The titles, 'Gli Amanti' and 'Le Amanti,' are somewhat difficult of translation. *Lovers* and *Sweethearts* might do if both conveyed an "improper" meaning. There are no English words to express the relations indicated but such as are either insufficient or too gross. Of course, as good Anglo-Saxons, we thank Heaven that our language does not allow us to mention vice without stigmatizing it. Still, virtue is, in a way, a limitation. The tender intimacies that form the subject of these stories are not openly sanctioned by society; of that fact, however, the authoress seems unconscious. With scarcely an exception, the lovers are the most refined and the most elegant of a class in which refinement and elegance are the rule. Gentle breeding and surroundings of luxury unite in the sentimentality of the writer to invest them with a sympathy that is almost poetry—indeed, it *is* poetry, so far as treatment can make it so. And if the end of these illicit relations be almost invariably disappointment and heartache, that is not because there is a Nemesis that pursues wrong-doing, is, in fact, inherent in it. Nothing could be further from the ideas of the authoress than a moral judgment. A mild pessimism, born of satiety, seems at first sight the whole of her philosophy; only, the observation of human nature is at times so clear-sighted, and the satiety or the heart-ache comes so inevitably to all these lovers, that one may suspect that, after all, she understands the deeper meaning of the world she depicts. At any rate, the lesson is there, whether she intends to preach it or not. Even in the two stories where the fair sinners, narrating gayly their own experience, tell how they were so wearied at not being able to find anything to complain of in the lovers they had chosen that they could console themselves only by taking others, the bare facts are eloquent, and to those who have eyes to see and ears to hear, facts are the best of sermons. The world at large, however, is more likely to take Matilde Serao's sweets as bon-bons rather than as medicine, and many find that they upset the stomach rather than put it right.

Taken as bon-bons, there are among the number some very good ones. To my taste the best are under the title 'Le Amanti.' The others are mere sketches; these are real stories, beautifully told, and one at least of them—"L'Amante Sciocca," the stupid mistress—a little masterpiece. The story is not a new one. A man of genius, a poet, who has had more than enough of love-affairs with women turbulent, pretentious, exacting, or otherwise troublesome, wishes to be loved by one who is simple, even though she be a trifle stupid. The case is not uncommon; indeed, the history of literary men is full of such, and, mistress or wife, the same pitiful comedy is enacted over and over again. He finds a woman who is as much his superior by the heart as he is hers by the head, and the union is from the beginning doomed to be unhappy. Its story is told by Matilde Serao with a grace and pathos altogether admirable, and quite worthy of the author's position among the very best of living Italian novelists.

It would be difficult, not to say impossible, not to admire the work of Gabriele d'Annunzio unreservedly when he writes poetry, with certain reserves when he writes prose, or at least when he writes novels. The prose in itself is beautiful; it can be reproached only with a polish perhaps excessive, and with having adopted, along with the naturalistic creed, some of the tricks of style of Zola and the brothers De Goncourt. It is with the matter rather than with the manner that we find fault, and our quarrel is, after all, rather with the school to which he has attached himself than with this or any other single work emanating from it.

The protagonist of 'Trionfo della Morte' has a certain aristocratic refinement and fastidiousness both of taste and of character; make the most of it—it is his only virtue. He is worthless as son, brother, and nephew; as a lover he is purely and simply an animal. For the rest he is a *décadent* with a touch of madness about him. His mistress is but a pale character, little besides a body, and that a diseased one. Such as it is, it has no mysteries for us. Clothed and unclothed, we are allowed to know everything about it that she, or her lover, or her doctor could know, and we follow it through all its actions and sufferings for several seasons, including much that could have no legitimate interest for any one but herself or, at most, her companion. The chief interest of the book centres in the latter. The study of the mental states of a man of intelligence and sensibility, weak, morbid, and corrupt though he be, may not be agreeable, may not even be wholesome reading, but, executed with the mingled delicacy and force brought by the author to the task, it holds the attention from beginning to end. Not that there is no temptation to skip. The main thread of the story, painful and often exasperating, is set off by episodes some of which could be endurable only to one who has an abnormal appetite for horrors. For instance, the description of the pilgrimage to the Shrine of Our Lady of Casalbordino is wonderful in its vigor and clearness. The crowd of the ignorant, the superstitious, the afflicted in mind and body, together with the beggars, the charlatans, the swindlers who prey upon them, the spectacle of loathsome diseases and infirmities, of squalor, filth, and all imaginable forms of baseness that are brought together on such occasions—all this is given with an accumulation of details that would be simply stupefying were it not for the intensity of the author's vision. You seem to see, to hear, to smell, to suffer and be disgusted with him, until finally, in spite of the fascination of his art, I fancy that few will not gladly take refuge in the reader's privilege of skipping.

There are other disagreeable episodes in the book—indeed, given its intention, it could scarcely be otherwise; but then again there are passages of rare beauty and interest. The landscapes about Albano and Monte Gargano are traced with a master hand; better yet, the master is a poet, and in his words the charm, the mystery, the suggestiveness of the scene are all embodied. Then, too, the life of the peasants of the Capitanata, with their legends, their superstitions, their picturesque outside, and the pathos of their ignorance, their sorrows and their patience, furnish material for chapters that are worth more than a cursory reading. The artistic instinct of the author has made him invest his tragedy with every splendor of execution and imagery at his command; his novel is a work of art, where each part, even the least, is finished as carefully as if it were a statue or a sonnet. In fact, it is poet's prose. Other writers, *e. g.*, Zola, may bestow as much care on their style, but that is not all. The sentences of Gabriele d'Annunzio have the music, the indefinable charm, the sentiment of poetry. On occasion they are decorated with the ornaments usually reserved for verse alone. An effect very like that of a refrain is obtained by repetitions of a sentence. For instance, a certain brook that flows transparent over the pebbles and under a fringe of poplar-trees appears again and again, always described in the same words; and these, in fact, are so well chosen that any change in them would be for the worse. Also, the reveries of the protagonist about an uncle whom he had loved in youth are invariably accompanied by a portrait in which no touch is ever changed; and a description of Orvieto is repeated word for word. But, with exquisite art, the image of the uncle Demetrio is given in a solemn, almost mystical cadence, in which the very tone takes on the sentiment of reverie and memory, while the little picture of Orvieto is like a cameo of Gautier for delicate finish.

One may wish, then, that the author had chosen to tell us about persons for whom it would be easier to feel something like sympathy, that his main subject had been something other than the ups and downs of a passion almost entirely animal, that he had not espoused an artistic creed which accepts things as worthy of careful delineation in direct ratio to their disagreeableness. And yet one must

own that he has given us a work of art of a high order, and that he has succeeded in investing a story of mortal corruption "with light, with music, and with perfume." The effect recalls certain martyrdoms of Rubens, where the most delightful carnations, the genial force of the master, are lavished upon a scene of the most revolting horror. Such a book can appeal only to the limited public that is solicitous of perfection in art, or the other, equally limited, that is interested in morbid psychology. Between the two, perhaps aided somewhat by fashion, the novels of Gabriele d'Annunzio reach always a certain number of editions, and are beginning to excite attention also in France. It is not easy to believe that the sentence from Nietzsche that is printed at the head of this volume can have more than a partial application:

"Es giebt Bücher welche für Seele und Gesundheit einen umgekehrten Werth haben, je nachdem die niedere Seele, die niedrigere Lebenskraft, oder aber die höhere und gewaltigere sich ihrer bedienen: im ersten Falle sind es gefährliche, erbröckelnde, auflösende Bücher, im anderen Heroldsrufe, welche die Tapfersten zu ihrer Tapferkeit herausfordern."

Leaving aside the question of the truth of this sentence, it may be that the present work may be dangerous, disintegrating, and dissolvent for some minds, but it can scarcely be for any more than an artistic pleasure, and in no wise a trumpet-call to moral courage.

It is refreshing once in a while to get hold of a novel that does not turn upon a breach of the seventh commandment, and we are grateful to Sig. Rovetta for putting this sin into the background of his action. 'La Baraonda' (which may be translated Babel or Babylon) is the world of bogus enterprises, of sham patriotism, of easy manners and adventures. The hero, Matteo Cantasirena, carries his impudence, his mendacity, his dexterity in manipulating men and circumstances in his own interest to a heroic height. He is by turns patriot, newspaper editor, originator of grand schemes, failing periodically and always getting again upon his feet. His character is admirably drawn and sustained; one may trust its lifelikeness to be recognized outside of Italy. The minor characters are also done to the life—the two soi-disant nieces who are the accomplices of Matteo, the others who are his victims, the German banker Kloss, as great a rascal as goes unhung, who, however, keeps within the bounds of legality and encompasses the downfall of Matteo. The crash comes in the break-up of a sort of lesser Panama—a scheme for uniting all the greater streams of northern Italy by a system of canals, in which the only work really done is the emission of shares and the attempted manufacture of a confiding public for them. As might be surmised, nobody in such a world is of much value; the dupes are weak and the others are rogues.

The author's tale of it is cleverly told, is good of its sort. The fault may be mine if I do not find its merits even greater, but I confess that, after reading even greedily a straightforward story of sharpers and their surroundings, I am apt at the end to be a prey to serious doubts as to the value of the entertainment. It is probably because the tone of the narrator so often echoes that of the world of which he tells. Thackeray describes Vanity Fair, and Balzac, even without visible moral purpose, delineates every turpitude of modern life, and we have no shadow of doubt as to the quality of the performance; but one's serious judgment takes a sort of revenge upon the minor artist who may have amused us with the same spectacle. This may involve a certain injustice, but it is inevitable if we would hold high our standard of literary excellence. In the case of Sig. Rovetta, his 'Baraonda' has so much the character of really good work that I hesitate to apply to it these remarks; but then somehow it has suggested them. S. K.

Correspondence.

THE VICIOUS CIRCLE OF OUR CURRENCY.

To the Editor of The Nation:

Sir: I wish to call your attention to a phase of the silver question:

A and B are rival bankers in a small town in Illinois, and there is bitter enmity between them. In exchanging checks, A has balances against B amounting each week to about four thousand dollars. B, to "get even," insists on paying with silver dollars, which he gets from the assistant United States treasurer free of all charges. A must accept them, and each week sends several thousand silver dollars to his banker in Springfield, who ships them to Chicago at one dollar per thousand express charges. So they go in a circle every week, causing trouble, expense, and many bad words.

Very truly, H.

Springfield, Ill., January 19, 1895.

CONFEDERATE STATISTICS ONCE MORE.

To the Editor of The Nation:

Sir: It is, I feel sure, not the desire of so able and broad-minded a journal as the *Nation* to do intentional injustice to any one, yet the friends of the late Gen. D. H. Hill cannot help feeling that in your issue of December 20, 1894, you seriously misjudge that officer.

In criticising his report of the numerical strength of his division in the battles of South Mountain and Antietam, you say:

"His statistical returns to the adjutant-general on September 22 reported 5,071 as the effective force of officers and men present for duty—a quick resurrection of the annihilated division! It is not pretended that he received any reinforcements. His killed and his wounded he reported at 2,316, and, adding these to the number present after the battle, it is proved that he had at least 7,387 on the 13th of September, leaving out the missing."

From the 13th to the 22d there were two battles fought, and this report of 7,387 men present was made five days after the last of these.

Is there not a fallacy in this method of estimating the number of troops present at a given time? Try it by an analogous case. On the 22d of September (the same date as Hill's report), Hooker's corps, according to the itemized field returns for that day (Official Records, Series 1, Part 2, p. 349) had present for duty 15,239 officers and men. Now, applying your method of proof, this corps must have had, on any immediately antecedent date, say the 18th, this number, 15,239, plus the casualties of any intervening battles. It so happens, however, that there were no casualties in these four days. So, by this plan, "it is proved" that on the 18th this corps must have had 15,239 officers and men present for duty. But from the field returns of General Meade (p. 349) we find that it actually had only 6,364! No reinforcements had come to this corps. Simply 8,875 men had, according to this official count, been, by the incidents of war, separated from their commands, but were back for duty by the 22d.

If, then, Hooker's corps could in four days increase, by the return of its scattered men, 8,875, was it so utterly impossible for Hill's division, from the same cause, to increase 71 men in nine days? I say 71 men, because he reported his division at 5,000 on the 13th and at 5,071 on the 22d, nine days later. The returning men, scattered by nearly a month's (from August 20) marching and fighting, but getting back into place with the end of the campaign, just about counterbalanced his casualties.

That Gen. Hill was right in his statement of his strength on the 13th is shown (1) by official testimony. You insist on the returns of the adjutant-general. Adjutant-General W. H. Taylor of the Army of Northern Virginia says that Hill had less than 5,000 men at South Mountain ('Battles and Leaders,' vol. ii, p. 578, editor's note). (2.) By historical testimony. Lossing ('History of the Civil War,' vol. ii, p. 469), Swinton ('Army of the Potomac,' p. 202), Longstreet (article on Maryland campaign, 'Battles and Leaders,' vol. ii, p. 665), and others all substantially corroborate this figure. (3.) By the testimony of his subordinates in their reports, Hill had, on the morning of the 14th, five brigades, numbering on that morning as follows:

Rodes's, official report	1,250
Garland's (Garland was killed), McRae, his successor, reports less than	1,000
Anderson's (killed, no report), Col. F. M. Parker says	1,000
Ripley's (gives no numbers in report), Col. W. L. DeRossett says	1,230
Colquitt's	1,100
	5,580

If Garland's and Anderson's brigades were both under the numbers used in the summary, we see that Gen. Hill is perfectly borne out.

D. H. Hill, Jr.

Raleigh, N. C.

[The capital fact which we have insisted upon is, that both armies had a system of statistical reports, made for the purpose of having records of statistics from which there should be no appeal. These are known as the adjutant-general's returns. They are the *only* authority as to numbers present, absent on duty, sick, etc. They are made at regular and frequent intervals, they carry forward the comparison with last reports, they account for all changes, and "prove" like a merchant's books.

Other official reports are made of strategical movements, of battles and skirmishes, of marches and retreats. This second class often refers to numbers in a general way, but is in no sense intended to be, nor is in fact, statistical reporting. That is specially provided for, as we have stated. When the reports of battles, etc., in mentioning numbers, differ from the official statistical returns of the adjutant-general's office, the latter are the only authoritative criterion. Having access to a merchant's books, we do not fix his debits and credits by his casual correspondence, or his accounts of his business given on the street—we go to his books of account.

This is precisely what we have asserted with regard to army history. The official "books of account" are the statistical returns of the adjutant-general. They are

the appointed and only authority for figures. They must be applied to the National army and to the Confederates alike. The examples of doing otherwise which we gave in our reply to Gen. Fitzhugh Lee's note show the transparent sophistry of so doing. Further debate only makes this plainer.

All real students of the history of our civil war have been eagerly awaiting the completed publication of the Official Records, for the purpose of having these statistics put beyond dispute. It must be regarded as a dishonesty to ignore their authority, or talk of any descriptive reports of battles as if they could override these official statistics. Books which were written and published before the official publication, were excusable for using such evidence as was then available; now, writers are not. One of the authors named by Mr. Hill uses the identical sophisms which we exposed, in quoting estimates in round numbers and mere hearsay in contradiction of the official statistics. The only strong apology for Gen. D. H. Hill's descriptive report would be to say that he did not pretend to accuracy in his "round numbers," knowing that the statistical tables had been forwarded and would be referred to if accurate figures were wanted.

The reference to Gen. Meade's report of the numbers in Hooker's corps, after the battle of Antietam, does not militate against our position, but directly confirms it. He distinctly says his division commanders have been ordered "to account for the increase," and make these statistical tables tally with those that have gone before. Neither Union nor Confederate writers of any authority have used the reduced figures of Hooker's straggling corps in estimating the total of McClellan's army in the Antietam campaign. The wrong method we criticised was (among other things) the deduction of stragglers on the Confederate side while this was not done as to the National side.

If the discussion shall impress on the reading public the indisputable fact that there are official statistical tables which are the ultimate and only appeal on both sides, and must be used alike on both, the common sophistry which we have exposed will disappear from the treatment of our civil war. As the Southern archives were only partly saved, the discussion of Confederate numbers sometimes makes it necessary to argue backward from a subsequent report (an antecedent one being missing); while the regular series on the National side, being complete, saves the necessity of this. The data, however, are generally clear, and arithmetic is competent to deal with them conclusively.—Ed. Nation.]

CHARLES BRYANT IN ALASKA.

To the Editor of The Nation:

Sir: The letter of Mr. John W. Bingham, in your paper of the 3d inst., criticising my article, "A Chapter of Alaska," in the January number of the *New England Magazine*, must either have been most carelessly written, or else shows a spirit unworthy of any true critic. I am quite willing, however, to answer its strictures.

(1.) No claim is made that Capt. Bryant ever did set foot on Alaskan soil prior to 1868, though it is true that he had done so at uninhabited points for wood and water, and sometimes when near the shore to let the men get a touch of the land. It was well known to all whalers that the Russians were opposed to having vessels other than their own come into their ports.

(2.) Mr. Bingham's assertion that Capt. Bryant made "only two or three cruises in the North Pacific" is incorrect. Capt. Bryant spent seventeen years in that region.

(3.) No claim is made in the article that Capt. Bryant ever did command a whale-ship as captain. He held the position of first mate, acting as captain only when required. The title of captain was frequently disclaimed by him; but, as often happens, it has become so fixed by popular usage that he is never called by any other name.

(4.) The article does not claim that Capt. Bryant was acquainted with the habits of the seals and the conditions of the islands previous to his residence there in 1869. Nor was *any one* so acquainted. Mr. Bingham says that "neither Bryant nor McIntyre knew anything about the seal-islands," and that "their reports were not the result of any study of the seal-life." The truth is, that in 1869 Capt. Bryant made a close and special study of the seals; up to that time even the best naturalists had been ignorant of the peculiar and distinctive habits of the *fur*-seals, so entirely different from any other of their species. As a result of Capt. Bryant's observations and special study in 1869, his reports were published the following year, giving *the first* account of seal-life in detail. This knowledge was obtained by observation of the seals in their nurseries and by the aid of the most intelligent natives. As it was necessary that a Russian clerk be employed as interpreter, Capt. Bryant asked that Mr. S. N. Buynitsky, one of the department clerks at Washington, be sent up to assist him in taking charge of one of the islands; and this man remained there during the winter of 1870, while Capt. Bryant was called to Washington in consultation. The Russian creole referred to by Mr. Bingham was employed as a translator by the commander of the revenue vessel sent up to protect our interests—a department of the service entirely outside Capt. Bryant's jurisdiction.

(5.) Mr. Bingham's assertion that Capt. Bryant was sent up to the seal-islands by Boutwell to watch the "bad men of the leasing company, and Dr. McIntyre in especial," is absurd. Dr. McIntyre left his position in Washington to act as assistant to our new collector of customs at Sitka, and he and Capt. Bryant coöperated in all necessary ways. He resumed his former position in Washington the following year, and afterwards resigned to serve as business manager in the employ of the A. C. Co., remaining with them during the whole twenty years of their lease, till 1890. Capt. Bryant and Dr. McIntyre have always had the highest esteem for each other, and are still warm friends.

(6.) In Mr. Bingham's statement that Capt. Bryant "stayed there just as long as he could stay—seven years—until Bristow removed him," there is an insinuation as discourteous as it is ungrounded. He stayed as long as he wished, which was nine years, from 1868 to 1877; and he was not removed by Bristow nor by any one. At the time of our purchase Mr. Boutwell did not favor the project; but in 1869, when it came under his jurisdiction as head of the Treasury Department, as his knowledge of the matter widened, he fully approved Capt. Bryant's measures in administering the affairs of the islands, assuring him that he had the entire confidence and support of the officials at Washington. Later, after political reasons entered into the public affairs of Alaska, Capt. Bryant resigned in due course, under Sherman's administration of the department, and retired to private life for private reasons. I should be very glad, as I am sure Capt. Bryant would be, to have anybody who cares about this matter refer either to Mr. Boutwell or Mr. Sherman as to the truth. Prof. Agassiz, Prof. Benjamin Peirce, and Mr. Blaine—all of whom were so familiar with Capt. Bryant's work—are dead, or they could add their emphatic testimony; but it is not necessary, for these things were not done in a corner.

(7.) The researches of Charles Sumner for material for his famous speech on the ratification of the treaty were thorough and far-reaching; for, as his biographer says, "no complete description of the territory existed, and his collection of facts treated of its fisheries, furs, timber, minerals, physical features, commerce, climate, history, and inhabitants, as also its possibilities in its new character as a possession of the United States." Among these sources of information was the testimony of Charles Bryant, which Mr. Sumner did seek, did acknowledge, did use, and did value. "Flimsy notes of whales and weather" (*vide* Mr. Bingham) were not sought nor needed. The emphasis which Mr. Bingham gives to this particular misstatement is sufficient to discredit all else which he has to say. Volume xi. of Sumner's Works contains the speech on "The Cession of Russian America," pp. 181-350. In this speech Mr. Sumner not only quotes verbatim from one of Capt. Bryant's letters, but makes this further reference: "His report goes beyond any chart of soundings I have seen, although the charts are coincident as far as they go." It may be said here that Mr. Sumner here speaks of Capt. Bryant as "Charles Bryant, Esq., a member of the Massachusetts Legislature," and also as "the retired shipmaster," thus courteously recognizing his standing. Capt. Bryant's journals and letters, containing a faithful record of his observations, were known to various scientific men, who recognized their high value, and Sumner was led by them to seek that information which he at any rate deemed sufficiently important to incorporate in his speech. At the date of Mr. Sumner's speech, the history of the seal-islands had not begun; to this end Charles Bryant was *selected* to go out as the honored agent of our Government, fully empowered and intrusted by the highest authorities in the United States to legislate for the good of all concerned. His success is a matter of history, and his records became a guide to those who have succeeded him.

(8.) Capt. Bryant's reports, sent to Washington yearly, are there on record, and are consulted by all in search of information in that line. They are not only valued as reliable, but have been spoken of as remarkable for their clearness and condensation. The 'History of the North American Pinnipeds,' No. xii., by Prof. J. A. Allen of Cambridge, published in Washington in 1880, by the Department of the Interior, contains a study of seal-life by Mr. Bryant, which should be seen in connection; and at the Museum of Comparative Zoölogy

at Cambridge are several specimens of fur-seals contributed by him.

If such work, the work of a man who was never self-seeking, but who gave his best efforts to improving the conditions of a simple people and to the faithful performance of a public trust, be the fruit of "illiteracy," then may the seed of such illiteracy be sown broadcast over the land. C. E. CABOT.

BOSTON, January 12, 1895.

P. S.—"J. A.," in your paper of the 10th inst., is writing of some other man. The Charles Bryant of the *New England* "Chapter" made his first voyage, a short one, in 1840-'41, on the Atlantic sperm-grounds, in the brig *Montezuma;* his second cruise was on the *Julian*, from 1841-'44, through the Pacific Ocean to the northwest coast, and in the region between British Columbia and the Peninsula of Alaska—a very successful voyage. His third cruise was as third mate of the *Nimrod*, in the North Pacific from 1845-'48, returning as second mate. His fourth cruise was from 1848-'51, in the Bering and Arctic Seas, returning as second mate. His fifth cruise was from 1851-'54, on the *Euphrates*, returning as first mate; and his sixth cruise, from October, 1854, to May, 1858, was as first mate on the *John Howland* of New Bedford, Capt. Alex. Taylor. These facts are on record, and go to prove "J. A.'s" criticism of no value.

I thank "H." for his fairly stated word of corroboration. But he makes one error in speaking of Capt. Bryant as *assistant agent*. Charles Bryant was *never* assistant agent; he was the chief, the head, the Special Agent of our Government on the seal-islands, the first one sent up there; and he held his position for nine successive years. C. E. C.

BOSTON, January 14, 1895.

[We can publish nothing more on this subject.—ED. NATION.]

Notes.

PROF. THOMAS EGLESTON of the School of Mines, Columbia College, is preparing a revised and enlarged edition of his 'Life of John Paterson' of the Revolutionary Army, and desires information and documents of any kind bearing upon Gen. Paterson's career. He will bear the expense of transcripts of such papers. His publishers, G. P. Putnam's Sons, announce further: 'Personal Recollections of War Times, 1861-'65,' by Albert Gallatin Riddle; 'A Literary History of the English People,' by J. J. Jusserand; the third volume of Traill's 'Social England'; 'Voice, Speech, and Gesture,' by Hugh Campbell and others.

D. Appleton & Co. announce 'The Pygmies,' by A. de Quatrefages.

Ufer's 'Introduction to the Pedagogy of Herbart,' translated by J. C. Zinser, is nearly ready to be published by D. C. Heath & Co., Boston.

Ginn & Co. will issue in March Defoe's 'Journal of the Plague Year,' edited by Byron S. Hurlbut of Harvard College.

'Dr. Judas' is the title of a work by an opium-eater, William Rosser Cobbe, relating to the habit, and to be published by S. C. Griggs & Co., Chicago.

The Hartford Seminary Press will issue immediately a second (revised) edition of Davis's 'Vocabulary of New Testament Words.'

'Transplanted Manners,' by Elizabeth E. Evans, is about to be published by Swan Sonnenschein & Co., London (New York: Scribners). The scene of the novel is laid in "Pension Irgendwo," a boarding-house on a German lake, where persons from different countries come together and exhibit their individual and national traits of character.

The Scribners publish 'Venezia,' adapted by Mrs. Arthur Bell (N. D'Anvers) from the German of Henry Perl, and illustrated by 210 drawings by Venetian artists. The text is a mere vehicle for the illustrations, and is of the sketchy, not to say sloppy, order common to such publications. The illustrations are remarkably good, and succeed as well as possible in conveying some idea of that wonderful sea-city, which cannot be represented in black-and-white, and has never been adequately rendered even in color. We cannot commend what Mr. H. D. Traill, in his introduction, calls the "richly but chastely decorated covers."

We have received four additional volumes of the International Limited Edition of the Waverley Novels, namely, 'Redgauntlet,' two, and 'The Betrothed' and 'The Talisman,' one each (Boston: Estes & Lauriat; New York: Bryan, Taylor & Co). Mr. Lang expatiates with warm praise on 'Redgauntlet,' for its qualities Shaksperian and autobiographic, and this volume has also much the best etched illustrations—since they are nearly all scenic. Apart from a few character-studies, the figure designs are feeble almost without exception. Of the two Crusader novels Mr. Lang prefers 'The Betrothed,' which he had never read till called upon by his present editorial function so to do. It is not amiss to remark that we are now arrived at the thirty-eighth volume in this series, and that ten more remain to be issued in this country, whereas across the water the conclusion was reached by the end of August last! Is not this one more indictment against a copyright act which compels a protected book to be manufactured in this country?

The appearance of Prof. A. S. Cook's 'Glossary of the Old Northumbrian Gospels' (Halle: Niemeyer; New York: Westermann) will be hailed with satisfaction by philologists on both continents. Though complete in itself, the Glossary is the first instalment of the author's long-expected work on the Old Northumbrian dialect, and its publication gives promise of the early completion of that arduous and important undertaking. The inconsiderate are prone to regard glossarizing as mechanical toil. This judgment, wrong in any case, would be ludicrously wide of the mark in the present instance. The mass of material here scientifically arranged could not have been even collected—to say nothing of its codification—without a profound knowledge of the Anglo-Saxon dialects. In other words, the Glossary not only implies the systematic Grammar—not yet published, though nearly ready—but much else which we hope Prof. Cook will not allow to slumber in his note-books. The *Nation* is not the place for the minute examination of a work addressed solely to specialists. We must therefore rest content with expressing in general terms our appreciation of the author's fidelity, learning, and acumen. The Glossary is in the highest degree creditable to American scholarship, and will do much to establish the study of Anglo-Saxon dialectology on a firm basis.

Students of English owe much to Professor Wülker of Leipzig for his latest service to science—the publication of a photographic reproduction of the Vercelli MS. ('Codex Vercellensis: Die angelsächsische Handschrift zu Vercelli in getreuer Nachbildung.' Leipzig: Veit & Co.). The four chief collections of Anglo-Saxon verse are the Beowulf MS. in the British Museum, the Cædmon MS. in the Bodleian, the Exeter MS. in the Cathedral Library, and the Codex Vercellensis. The last-named is of course rather inaccessible, though more than one enthusiastic scholar has braved the dulness and the discomforts of an Italian provincial town for its sake. The present facsimile puts this precious document into the hands of anybody who cares to pay a very moderate sum to possess it. It reduces the size of the pages by one-half, but is singularly clear and legible. The only exception to its legibility is at folio 54*a*, where a great smear, the result of some one's use of a reagent, defaces the original. Only the poetical part of the codex, or about a quarter of the whole, is reproduced, the remaining three-fourths containing prose homilies of minor interest. In a brief introduction Professor Wülker discusses the question how the manuscript got to Vercelli.

M. Henry Bordeaux's 'Âmes Modernes' (Paris: Perrin & Cie.) is a series of studies of very modern writers, Ibsen, Loti, Hérédia, Lemaître, Rod, and Villiers de l'Isle Adam, preceded by a chapter on "Symbolic Characters." M. Bordeaux dares be true to his convictions, and his admiration of Ibsen, on grounds clearly established by him, is noteworthy in presence of the discredit cast upon that dramatist by Sarcey and Lemaître; but M. Bordeaux is a philosopher. The chapter on Villiers de l'Isle Adam is worth much more than the whole book on that remarkable writer which was recently noticed in these columns. M. Bordeaux may seem a trifle heavy at times, but it is weight of thought which is the cause of this defect of style.

After an interval of three years, Mr. James Clegg, Rochdale, England, has issued a fourth and enlarged edition of his very useful and trustworthy 'International Directory of Second-Hand Booksellers and Bibliophile's Manual,' including lists of the world's public libraries, publishers, book-collectors, learned societies and institutions, theological colleges, Burns clubs, etc. Stress is laid upon the fulness of the list of public libraries, but in the case of the United States it is obvious that the half has not been told, although there is no hint at any limitation based on size, and generally, perhaps, the number of volumes is not stated—a defect from the bookseller's point of view. But the buyer of this little book abundantly gets his money's worth.

A new contribution to the already voluminous Bismarck literature is Wilhelm von Bülow's 'Neue Bismarck-Erinnerungen' (Berlin: Steinitz). The reminiscences go back to Bismarck's first meeting with Prince Wilhelm (afterwards Wilhelm I.) at a court ball, not in 1844, as here stated, but in the winter of 1835-6, and consist chiefly of lively anecdotes, which are entertaining reading, but do not add anything of importance to our knowledge, or modify our appreciation, of the German diplomatist and statesman.

More systematic in arrangement and more satisfactory as a biography is Wilhelm Buchner's 'Feldmarschall Graf Helmut von Moltke' (Lahr: Schauenburg), which has been issued as a "Festgabe" for the celebration of the twenty-fifth anniversary of the decisive battle of Sedan. The author's aim is, as he expresses it, to trace the growth of the inner man, and to disclose Moltke's *Gemüthsleben*, or the emotional side of his nature. In so doing he quotes largely from the letters of the distin-

guished field-marshal, which have been, for the most part, already printed. The frontispiece is a portrait of Moltke from a photograph taken in 1872.

The London *Bookman* is to have an American edition, under the direction of Prof. H. T. Peck of Columbia and James Macarthur, with a corps of American assistants. Dodd, Mead & Co. will give it their imprint.

Prof. H. B. Hulbert and Dr. H. G. Appenzeller of Seoul propose to reissue the *Korean Repository*, which flourished in 1892. This monthly magazine will be devoted to literary, scientific, linguistic, and archæological matters, while giving a monthly digest of news in the Land of Morning Calm.

Mr. A. W. Pollard takes the floor in the December *Portfolio* (Macmillan), and discourses with competence on "Italian Book Illustrations, chiefly of the Fifteenth Century." Venice and Florence furnish his longest chapters, and in the latter much attention is given to the illustrated Savonarola literature. He plausibly suggests a kinship between Francesco Buonaccorsi, who printed the earliest dated Savonarola tract, and the monk himself, a member of that family, whereby "Savonarola may have had some direct share in the introduction of artistic book-illustration in Florence." His sermons, at all events, show that "he was keenly alive to the service which art might render to the cause of religion." Mr. Pollard lays stress on the fact that it was the needs of the humbler and non-literary classes that induced book-illustration; the wealthy went without, or employed hand-work. He has a weighty and very just general remark that "the books which have been designed to please the eyes of a more cultivated class . . . have seldom been entirely successful. The soberness of printed books appears to resent attempts at too great magnificence, and few artists of note, when they have attempted book-illustration, have worked with any due sense of the limitations imposed on them by the necessities of the press." This monograph is very abundantly illustrated from early examples; most curious, perhaps, being the "Triumph of Love" of the 1499 Florence edition of Petrarch's "Trionfi," but derived from another source than the unique copy in the Victor Emanuel library at Rome, which was facsimiled a year or two ago. Pacini, the publisher, reproduced it on the title-page of another work in 1508.

The January number of the *Portfolio* is a monograph on "The Early Work of Raphael," by Julia Cartwright (Mrs. Henry Ady). Under this title is included everything the artist did during his Umbrian and Florentine periods and up to the time of his departure for Rome in 1508. Mrs. Ady closely follows Morelli, and her text may be taken as giving the current conclusions with regard to Raphael's work during this period; and the illustrations, as usual in this publication, are excellent. The frontispiece is an admirable photogravure of the charming "Madonna del Granduca."

A most attractive field for the archæologist and explorer is described by Mr. G. R. Lees in the *Geographical Journal* for January, in his account of a recent journey across southern Bashan. The character of this little-known region on the east of the Jordan is rapidly changing with the advent of the Circassians, who have been planted here in considerable numbers by the Turkish Government. The deserted sites of ancient cities, as Amman, the former Rabbath-Ammon, or Philadelphia, for instance, are becoming towns full of life and activity. But this returning population means the destruction of many priceless monuments of the times of the Roman occupation, and possibly of earlier races, which are scattered over these plains. At one place "masons were at work splitting the large stones" of ruined temples and churches "for the erection and completion of houses." The Bedawin, according to Mr. Lees, are gradually being dispossessed of their country by the newcomers, who are "a people not only more industrious, but more religious, and more inclined to pay the taxes." Several ruined cities, hitherto unknown, were discovered, and some inscriptions obtained, but the hostility of the natives made a thorough exploration impossible. Other articles are upon Mashonaland and the Westland Alps of New Zealand, whose glaciers show an astonishing rapidity of movement, the maximum observation being 207 inches per day. Prof. Coleman of Toronto describes a journey to Mount Brown at the source of the Athabasca, which he found to be about 9,000 feet high, instead of nearly 16,000 feet, the altitude usually given to it by geographers.

"The Economic Development of Canada" is the subject of a suggestive article by Sir Charles Tupper in the *Scottish Geographical Magazine* for January. From a large array of statistics we take the most important facts. The railway system has increased since 1867 from 2,000 miles to over 15,000. A tonnage of more than a million tons places the Dominion "fifth in the list of ship-owning countries," between Germany and France. The aggregate trade has almost doubled since confederation, amounting to nearly $250,000,000 in 1893, while the interprovincial trade has grown from four to one hundred millions of dollars. In industries, Canadian cheese "is rapidly supplanting American cheese in the British market." In 1873 and 1893 the exports of this article were respectively 24,000,000 lbs. and 134,000,000 lbs., in round numbers. The exports of the United States for 1881 and 1893 were 147,000,000 lbs. and 81,000,000 lbs.; this latter figure being 10,000,000 lbs. below the return for 1873. The efforts of the Government to promote the dairy industry "by sending travelling dairies, with competent instructors and lecturers, throughout the different provinces, for the practical demonstration of the best methods of manufacture, packing, and marketing," it is hoped will produce a corresponding development of this industry. The McKinley tariff has proved a blessing in disguise by stimulating Canadians to find new markets for their products. Illustrating the paper is a valuable series of maps and diagrams showing the routes to Canada, its political divisions, orography, geology, rainfall, temperature, aggregate trade, trade exchanges, exports, imports, and bank deposits.

It is to be regretted that the strange variations in the character of seasons from year to year have been subjected to so little really careful investigation. From the so-called "blackberry winter" of Arkansas and Kentucky, when an abnormal lowering of temperature during May, while blackberries are in blossom, is said to insure an abundant supply of fruit, to the sudden Florida "norther" which ruins the orange crop, the industries of half the country at large are affected more or less seriously by vagaries of climate. Some of the causes of these irregularities are investigated, in the *American Meteorological Journal* for January, by H. Gawthrop, who ventures the conclusion that variations in the character of the seasons must be traced through all effects of diurnal and seasonal insolation, and of cyclonic storms in the lower air, to the immense, ever-flowing westerly current above. This great atmospheric flow is likened to a vast river, with a swift current in the middle, but which oscillates north and south with the sun, varying also with the character of the continents and oceans over which it passes. Other influences are cited, the wide-reaching and high cyclones of the tropics among them; and the writer's final result seems to be that accurate forecasts of our seasons can be made only when this great unnamed river of the atmosphere, gaining its first impulse from the rotation of the earth, shall have become thoroughly known from highest-altitude observations.

The "invitation" of ladies to the ordinary meetings of the Royal Astronomical Society of London is dealt with in recent printed announcements directing the attention of fellows to the fact that ladies are admitted to such evening meetings of the society only "by special invitation of the president, sanctioned by the Council," the invitations being issued at the commencement of each session. It is to be hoped that the penalty to any fellow assisting any lady in running this blockade of formality is a gentle one, and to the lady gentler still.

Two portions of the succinct report of Newnham College, Cambridge, for 1893-94 possess general interest, viz., that which contains an account of the presentation of the Clough memorial gates (November 3, 1894), and a tabular statement of the present occupations of former students. The wish of the Newnham students who had been privileged to reside there during the rule of the noble woman whose quiet firmness and womanly tact did so much to advance the higher education of women in England, was to contribute a memorial which should, by some outward and visible sign, "associate together the name of Miss Clough and the college so long as the college should exist." Beautiful and costly bronze gates, fashioned mainly by handwork, in the roadway between the old and the new halls, were the selection of the committee in charge. A balance of £80 becomes the nucleus of a fund placed in the Principal's hands, "open for a term of years, to all who may desire to contribute to it," and to be used, in small grants, for the assistance of students. Of the 720 students who left Newnham from October, 1871, to June, 1893, sixteen deaths and thirty-seven foreigners gone home give a remainder of 667 to be accounted for in active life. Of these, 374 (or about 56 per cent.) have taken teaching for a profession; 245 of these are head or assistant mistresses in public, endowed, or private schools, 23 are private governesses, 27 are teaching in the United States or the colonies; the rest are lecturers, visiting teachers, etc. Of those students not professionally engaged in teaching, about 230 are living at home, 108 being married; five are engaged in medical work, two are missionaries, one has taken up market-gardening, one is a bookbinder, several are doing charity-organization work, and the small residue "are mainly engaged in secretarial work." It is doubtful whether this collegiate record of professional usefulness can be proportionally matched by any graduate list from colleges for either sex, either in Great Britain or in the United States.

At a recent meeting of the society organized less than a year ago for the purpose of founding a Mädchen-Gymnasium in Munich, Bavaria, it was resolved to proceed at once to the establishment of such an institution with eight classes, in connection with the public schools. This resolution indicates a laudable energy on

the part of the society in accomplishing the object for which it was formed.

We have the following from a distant reader: "In the *Nation's* last issue of 1894, the correspondent who shows that Yale College was founded on books and not on brawn, brings to mind the fact that Harvard also had a similar foundation. In 1638, before one tree had been felled for building the proposed college, the will of John Harvard bequeathed to that institution, together with one-half of his estate valued at £779 17s. 2d., his whole library of 320 volumes. A list of all these books is preserved in the University archives, though all the volumes themselves save one were burned in 1764. But they had been for more than a century and a quarter placed where they would do the most good. The catalogue ought to be published *in extenso*. It had Bacon's name—but not Shakspere's. Greek was represented there by Homer, Isocrates, Plutarch, and Lucan; Latin by Pliny, Sallust, Terence, Juvenal, and Horace."

—The *Psychological Review* (Macmillan) for January opens with a somewhat detailed "appreciation" of the late Prof. Helmholtz, by his colleague, Prof. Stumpf of Berlin, whose qualifications no one will doubt who is familiar with Stumpf's work on the theory of sound-sensation and music, in his 'Tonpsychologie.' The title of the article, "Hermann von Helmholtz and the New Psychology," will indicate to our readers the scope of Prof. Stumpf's admirably discriminating and sensible article. We are especially struck with the remarks on the theories of "unconscious judgment" and "specific energies," the two points of view, one in physiology and the other in psychology, which gave Helmholtz and his friends most embarrassment, and on the matter of which—as Stumpf notes explicitly in what he says of specific energies—the world is not yet much wiser than Helmholtz was. His passing suggestion of a comparison of Helmholtz with Darwin certainly strikes one as a "putting together of incommensurables"; and yet if we draw the circumscribing horizon of discourse wide enough, the comparison is instructive Americans will note with sadness, especially those who met Helmholtz in Chicago and elsewhere, that it was during his absence from home, on account of our Columbian Exposition, that he met the beginning of his end. In the same article Prof. Stumpf intimates that the new edition of Helmholtz's 'Physiologische Optik,' which has been so long in execution, will be finished with only bibliographical alterations of the old edition. In the same *Review*, medical readers will be interested in Dr. Starr's contribution to the problem of the "Location of the Muscular Sense in the Brain Cortex."

—Although as a rule we do not notice grammars, we mention 'A Text-Book of Modern Spanish,' by M. M. Ramsey, B.S. (New York: Henry Holt & Co.), because of the very great advance it shows over all existing Spanish grammars in English. This applies to almost every detail of the work. To begin with, the present use of the graphic accent in Spanish is, for the first time in an English book, clearly and accurately described as well as rigidly applied. This, it need hardly be said, will prove an immense relief to teachers who have had to struggle with the confusions and inconsistencies in this matter which abound in previous text-books. Passing to things of a more fundamental kind, we are struck by the fulness, clearness, and precision of statement everywhere shown; and, what is still more gratifying, we find this best exhibited where the difficulties of the subject most require it, *e. g.*, in the treatment of the uses and correspondence of tenses, of the passive voice, of the subjunctive mood, of the rules of agreement. If we were to make a criticism here, it would be to express a regret that the author has not more resolutely employed the grammatical categories which the grammarians of Greek and Latin have found so useful. By so doing he would, in our opinion, have made still clearer his excellent treatment of conditions, wishes, clauses of purpose, result, time, etc. On the other hand, we must congratulate Prof. Ramsey on the appositeness as well as on the fresh and idiomatic character of his numerous examples. His exercises, also, are much above the run of those in ordinary grammars, both for variety and for interest.

—The very thoroughness with which the author has done his work, however, suggests a question of considerable importance for future writers, not only of Spanish, but also of all modern-language grammars, namely, whether the time has not come for separating grammar proper from its usual accompaniments of vocabulary and practice-work, leaving the latter to be treated in special introductory manuals. The Greek and Latin grammarians long since adopted this plan, and with excellent results. Why should the grammarians of modern tongues persist in a clumsy, unscientific method, that meets the needs neither of the beginner nor of the advanced student? Is it wise, for example, for Prof. Ramsey to inflict upon the former a treatise of over six hundred and fifty pages, in which are combined a grammar, a rhetoric, a manual of conversation, and a language drill-book? It seems to us not. For, to say nothing of the unwieldy bulk of the book, the effect of the plan on the whole manner of treatment is often very unfortunate. The necessities of the practice-book constantly compel division and confusion in the discussion of grammatical principles; while, on the other hand, the full exposition of the latter frequently overbalances the real necessities of drill. We hope the time is not far distant when all the chief modern languages will be treated for beginners in practical elementary text-books, similar to the numerous excellent lesson-books in Latin and Greek; while the advanced student will be provided with systematic grammatical treatises like the best classical grammars. In the meantime, no serious student of Spanish can afford to be without Prof. Ramsey's work; and it may be that the skilful teacher will find a way to employ it successfully even in elementary instruction.

—After three years' experiment of an independent theatre as a personal venture, Mr. J. T. Grein announces its incorporation as "The Independent Theatre, Limited," with a modest capital of £4,500, represented by 3,500 ordinary shares of £1 each, and 1,000 founders' shares of the same value. The company proposes to continue and extend "the great service" which it is claimed the Independent Theatre has already rendered to the London stage, by the production for a limited series of performances of plays of artistic merit and literary interest, but of which the commercial value is uncertain. The main object will be, as hitherto, "not competition with other theatres, . . . but to assist them by discovering new authors of merit as well as new actors and actresses of talent." Experience having proved that it is impossible to cover the expenses by a single performance, each play in future will be given several times, probably a week in each case. Shareholders and "critics" will enjoy the exclusive privilege of first performances; the rest are intended to enlighten the general public. One source of income to the new company is a fixed percentage on the profits arising from any subsequent performances of these plays, Mr. Grein having also made over to the company all rights held by him in works already produced under his management. In addition to free seats, the glittering promise of a dividend is held out to shareholders, and every subscriber of 10 ordinary shares is entitled to 1 founders' share—the balance of these latter being allotted to Mr. Grein, "as his sole remuneration." The new season is now opening with "Thyrza Fleming," an original play by Miss Dorothy Leighton, who is associated with Mr. Grein as one of the two "permanent directors" of the corporation. Later a second performance will include Mr. William Heinemann's play, "The First Step," and during the year it is proposed to give advocates of the modern drama an opportunity to criticise native plays by Mr. George Bernard Shaw, Mr. Hubert Crackanthorpe, Mrs. Oscar Beringer, etc., besides translations of works by Ibsen, Edward Brandes, and Gerhart Hauptmann. It remains to be seen whether London playgoers are to place "on a sound footing an Independent Theatre, where good original works . . . may be sure of a sympathetic hearing."

—In No. 1 of vol. ii. of the Studies published by the University of Nebraska, Mr. E. H. Barbour presents "Additional Notes on the new Fossil, Daimonelix," with twelve process plates. Since the previous publications on the subject, continued search has discovered "some of the best specimens that can ever be found." "The author still counts them anomalous and entirely unique." They occur, below a foot or two of flint, at all depths in the upper two hundred feet of a bed of sand rock more than six hundred feet in thickness, between the Niobrara and the White Rivers of Northwestern Nebraska and Southwestern Dakota, near Pine Ridge. Each fossil is a long, cylindrical body, of several inches in diameter, that descends with an incline varying in different cases from twenty to forty degrees, from a particular level to a depth of five to eight feet, and thence ascends vertically in a closely wound spiral, rising ten inches or more in each circuit, to the level from which it started. "Devil's corkscrews," "twisters," etc., are local names alluding to the spiral portion. The outer portion of each is filled with cellular tissue which in more limited amount extends into the interior. Mr. Barbour says, "The fossil, strange as it may seem, stands undetermined. It has been visited and examined by some of the best botanists, geologists, and palæontologists, and yet none can pass judgment upon it." Various interpretations are discussed, without reaching definite conclusions. If the fossils were burrows, he says, he does not believe they were made on the slopes of hills, or around the edges of a retreating sea, or that they were made under water; he is not certain whether they were burrows or plants, whether the burrower lined his burrow with plants, or whether the plants grew there; he does believe, however, that the fossils were either made or grew where they are found as the sediment was deposited. Our author has indulged in too much mystification. A reasonable interpretation of his data is that the fossils are casts of burrows made in front of an advancing sea at the surface of sands laid down

by the winds (or, possibly, laid down and left bare for a time by the waters), the cellular structure being that of vegetation which found a favoring lodgment in the accretions of the walls of the burrows as the waters filled them, driving the burrowers to higher levels; the upbuilding continuing until finally the sea rose above the entire area, stopped the burrowing, and covered the sand rock with the flint. A small skeleton found in one specimen may have belonged to an owner of the burrow. Comparative studies of recent burrows would have thrown light on the fossil, and given the contribution a much greater scientific value.

—The fine green color of the much-prized oysters of Marennes was long supposed to be due to the ingestion of salts of copper. This view was succeeded by another which accounted for the greenness by supposing that it was derived from the chlorophyll of certain diminutive marine algæ. This view, in turn, seems to be overthrown by some researches of M. Berthelot, who has been studying the question, and has come to believe that the green of the oyster has no connection with the chlorophyll of plants (on this point the question, he says, is closed); that the oysters contain iron; and that the shells owe their dark color to sulphuret of iron contained in them. The first of these conclusions destroys the chlorophyll theory; the other two are being developed by investigation. M. Chatin has examined the oysters, and the soil of the oyster-beds before and after the treatment (called "pavage") to which these oyster "parks" are submitted. He finds in the oyster that the branchiæ, the seat of the coloration, are twice as rich in iron as the rest of its body, and that the depth of the color is in direct proportion to the quantity of iron present. The soil of the beds before the pavage is black with compounds of iron and sulphur and ammonia. Afterwards, in consequence of oxidations, the soil is of an ochre red, and contains only ferric sesquioxide and nitrates and nitrites. The *huître de Marennes*, then, is simply an oyster rich in iron. Perhaps, if it should be exhibited freely and continuously, it might prove a specific in cases of Décadence and other anæmic conditions of literature and art.

"MODERN CONNOISSEURSHIP."

Lorenzo Lotto: An Essay in Constructive Art Criticism. By Bernhard Berenson, author of 'The Venetian Painters of the Renaissance.' G. P. Putnam's Sons. 1895.

THE present work affords an excellent opportunity for the study of that latest form of modern criticism of art which was instituted by Morelli. While differing from Morelli occasionally in his conclusions, Mr. Berenson is a faithful and admiring disciple of that critic's methods, and those methods are pushed by him as far as they can well go. The occasion for examining the methods is all the better in that we have no quarrel with Mr. Berenson's conclusions, and no opposing theory to maintain—are even inclined to admit that he has made out a fairly good case for his contentions, and established the probability, at least, of his views—and can therefore devote ourselves to a dispassionate inquiry into the soundness of his premises and the validity of his reasoning.

The modern form of criticism of which Morelli was the founder bears a close resemblance to that form of literary criticism which is marked by the application of the "metrical test" to the works of Shakspere. The theory of the metrical critics is, that what most of us recognize vaguely as "style" is capable of analysis and exact measurement, so that the difference we feel between the verse of Shakspere and the verse, say, of Fletcher, is a difference which can be scientifically demonstrated. It follows that from the careful study of undoubted works we can arrive at formulæ which will enable us to determine definitely, and almost without possibility of error, the authorship of doubtful works or passages. So Mr. Fleay, for instance, applies the scales and the yard-stick to "Henry VIII.," counts "light endings" and "weak endings," and parcels out that play among some half-dozen collaborators, sharply marking off the scenes and passages supplied by each, and settling to a line where one left off and the other began.

This kind of criticism has always been possible in literature if any one had thought of it, but there are physical reasons why it has only recently become possible in its application to works of art. Books are essentially reproductions, and the scholar could always compare the works of the poets one with another in his own library; works of art, on the contrary, are scattered over the civilized world, and connoisseurship was confined to such vague and limited characteristics of a master as could be carried in the memory from Madrid to St. Petersburg. It was only when the modern perfection of photography made the reproduction of pictures almost as common and as complete as that of books that the "modern connoisseurship" became practicable, and that Morelli was able to state that the first master of Raphael was Timoteo Viti, and that Giorgione painted the "Venus" in the Dresden gallery which had always been called a Titian, and did not paint the "Concert" of the Pitti, which was considered his most celebrated and representative work. Modern photography and modern criticism have upset the catalogues of all the galleries of Europe, changed and changed again the attribution of many famous masterpieces, ignored tradition and denied the authority of Vasari. The crook of a little finger has settled not only the authorship but the date of a picture, until something else has unsettled it again or resettled it another way. Much that has been done is well done, but the ordinary mind is sometimes staggered by the size of the superstructure and the exiguity of the foundation; and the artist, who judges by feeling, is sometimes inclined to dissent from the conclusions of the connoisseur, who judges by some small detail.

By these modern methods Mr. Berenson has attempted to reconstruct the life and career of Lorenzo Lotto, to determine who was his master and what were the paramount influences in forming his style or styles, what pictures he painted, and at what dates, and to read his character and define his personality. Though an interesting painter, Lotto was not a very great one, and the points in dispute about his life and artistic pedigree are not of vast importance one way or the other, so that we may fix our attention on the manner of demonstration rather than on what is sought to be demonstrated. Just what is the apparatus of "modern connoisseurship"? and do those who employ it succeed in proving all that they set out to prove?

No clearer statement of the method itself could be asked for than that which Mr. Berenson gives in his "Introduction," and that statement we shall give as fairly as the necessary condensation will allow. "Given a few documentary notices," he says, "and a number of pictures," how shall we "reconstruct the history of an artist's education and the early years of his career"? "In one way only, and that is by discovering what habits have become so rooted in the artist as to be unconscious, and under what influences he formed them." Direct painting from nature was much less common in the period of the Renaissance than it has since become, and habits of drawing certain details in certain ways were more readily acquired from the master and less easily eradicated in the pupil. "Habits tend to become fixed as they meet with least resistance. . . . It is in the less expressive features . . . that habits of attention are weakest and habits of execution, consequently, strongest." Those features are less expressive "which are less capable of a sudden change of look." These are the ears first, then the hands. Even less expressive are such things as the hair, the drapery, etc. So that the points at which the modern critic looks to form his judgment are therefore "the ears, the hands, the hair, the folds, certain idiosyncrasies of pose, and certain settings and backgrounds, as pronest to being executed in a stereotyped fashion." It is to these details, then, and almost exclusively to these details, that the modern connoisseur looks to tell him the history of an artist, to proclaim who was his master, or to establish the authenticity of this or that work attributed to him. This is the apparatus; let us see how it is employed.

Vasari states that Lorenzo Lotto was a pupil of Giovanni Bellini, and this statement has been accepted and repeated by all modern writers, even by Morelli. Berenson believes him to have been a pupil of Alvise Vivarini, and to establish this thesis is one of the main objects of his book. We do not think it unfair to state his conclusion before giving his course of reasoning, for the use of such phrases as "if we can persuade ourselves" would seem to show that this was, at least occasionally, the order in the mind of the writer himself. Of course the first necessity is to get rid of Vasari's testimony and that of those who have followed him. He first shows that all later writers have merely copied Vasari, and then denies that Vasari knew what he was talking about. "We need give no weight to Vasari's statement, except so far as it is borne out by facts." What are the facts? Titian and Palma, pupils of Bellini, were profoundly influenced by their fellow-pupil Giorgione. Lotto was a little younger than they and a very impressionable artist (Crowe and Cavalcaselle call him "a mush of concession"), and it is not conceivable that he should have resisted the influence to which they succumbed. As he shows this influence very little, he was *not* a pupil of Bellini.

Merely remarking, in passing, that in Mr. Berenson's own 'Venetian Painters of the Renaissance,' issued within the year, Lotto is put down as "pupil of Alvise Vivarini, influenced by Giovanni Bellini *and Giorgione*," let us admit that the destructive part of the argument is at least plausible, and go on to consider the constructive part. The earlier works of Lotto are taken up seriatim, and every coincidence in the pose of a hand or the drawing of a mouth, the curl of an ear or the fold of a drapery, with the work of other masters is noted. We then have a list of possible artistic ancestors, and at first sight it is a queer one. It is: Alvise Vivarini, Jacopo di Barbari, Cima, Montagna, Giovanni Bellini, Basaiti, Bonsignori, Bartolommeo and Antonio Vivarini. This is indeed an "apparent jumble of names."

Barbari is "supposed to have been a pupil of Giovanni Bellini and rarely in Venice; Montagna . . . has thus far scarcely been connected at all with the Venetian school; . . . Bonsignori . . . having been . . . the pure product of the Veronese School"; Cima is also generally reckoned a pupil of Bellini, and even, by Morelli, the foreman of his shop, while Antonio Vivarini died before Lotto was born, and the resemblance to Bartolommeo's work is to a picture which "it may safely be assumed Lotto had not seen." Bellini is already disposed of, in spite of a striking resemblance in one picture and many general resemblances, and the Vivarini are not difficult to dispose of. What is to be done with the others? It is evident that they must also have been pupils of Alvise.

We will take one instance in some detail and let it stand for the rest. The earliest works of Barbari of ascertainable date were done when he was probably about forty and had come under the influence of Antonello da Messina, yet they show strong resemblances to the work of the Vivarini. It is true that "certain points . . . noted as distinctly Vivarinesque are found in Antonello also, and that Antonello might therefore account for all that [is] explained by the Vivarini" in this and other cases; but that is explained by assuming that Antonello also was strongly influenced by the Vivarini. In other works Barbari reminds us of Cima, but we are shortly to prove that Cima was a pupil of the Vivarini also. The same holds true of Bonsignori. Finally, there is a drawing in the Uffizi, attributed to Garafalo, which we now assign, on internal evidence, to Barbari, and which is so like Alvise that in it "we have one of those precious links that connect master and master all the better for the difficulty of deciding precisely to which it belongs." When Barbari must have begun his apprenticeship, the Bellini were probably not in Venice, and he must naturally have studied with the Vivarini. The Vivarini must have been the great painters of Venice, because Dürer, on his first visit to Venice, admired certain painters who were not the Bellini and may have been the Vivarini. Dürer also admired Barbari, and Barbari "might have introduced him to the Vivarini." Having thus "established the relation of Barbari to the Vivarini, his relations to the young Lotto become at once easy of explanation."

This is necessarily a very bald statement of the argument, but we have tried to make it a rigidly fair one. Mr. Berenson himself seems aware that his logic may sometimes appear "circular." Having made out that Alvise was the head of a great school and the master of so many pupils, it becomes necessary to show what an important artist he himself was, for "the meagre and mangled Alvise who has come down to us" is "every way" inferior even to Cima. Therefore, on the same sort of evidence—the peak of a hood over the Madonna's brow or the shape of a hand and the pose of a foot—this picture and that portrait hitherto attributed to Bellini or Antonello or another are restored to Alvise, and his artistic personality is reconstructed as a preface to that of Lotto. Certainly this seems like proving a great deal. Let us examine a moment some of the specific mannerisms that are made to prove so much. Two habits of the school that are frequently referred to are the practice of drawing the "second phalanx of the thumb larger than the first," and "the great toe shorter than the others." A scoffer might be pardoned for suggesting that any one who had ever drawn a human thumb from life might naturally fall into the first of these habits, and that any one who had ever seen an antique statue might be tempted to adopt the second. Other mannerisms are less ill suited than these to the crucial rôle assigned them. Certain poses of the feet and certain arrangements of drapery may have been peculiar to the school of the Vivarini, but is it fair to take the "Madonna of the Redentore" from Bellini and assign it to Alvise on account of such peculiarities, and then to use these same peculiarities as proof that Lotto was a pupil of Alvise and not of Bellini?

It is only when we come to the portraits which Mr. Berenson attributes to Alvise, however, that we see the full beauty of his style of reasoning. In the first place, he admits that there is only one "perfectly authenticated portrait" by Alvise in existence, and that one "is so repainted that . . . . it does not do [him] all the credit it would otherwise." Nevertheless, he proceeds to attribute to him seven other portraits and two portrait drawings, almost all of which have been attributed to other artists, and some of them to more than one other artist. And here we must quote our author at some length. He is discussing a portrait usually attributed to Antonello, and, after some remarks about the drawing of the eyes which have a certain cogency, goes on:

"As in Alvise, but not as in Antonello, the nose is slightly hooked and the nostril inflated. The mouth, as very frequently in Alvise, but never in Antonello, is distinctly turned down at the L. corner (L. from the spectator), and rather turned up at the R., and has altogether more movement and sensitiveness than in Antonello. The cheeks are, for the type of face, fuller in this Layard portrait than in Antonello, and the modelling smoother."

Another portrait, *also attributed to Antonello*, has the same mouth "with one corner turned down and the other tending to curve up," and it also is given to Alvise. Leaving aside the question-begging nature of the argument which takes from Antonello every portrait with a certain kind of mouth, and assigns as a reason for doing so that he never drew mouths so, one is a little astonished to find such reasoning applied to *portraits*. The same thing is done again with regard to one of the drawings where Mr. Berenson "calls particular attention" "to the furrow coming from under the cheek-bone, and in part of its course almost parallel with the furrow coming from the nostril and curling around the mouth," which strongly resembles a furrow on the face of Alvise's "St. Clare." Does Mr. Berenson allow nothing for the direct observation of the model, even in a portrait? Does he mean us to suppose that the twisted mouth and the deep furrow on the cheek were not present in the sitters but invented by the artist; or that, though present, no other artist but Alvise would have reproduced them in his work? One or other of these absurdities he must mean if his reasoning proves anything whatever.

One more instance, and we shall have done. Two portraits are attributed to Savoldo, and these attributions "are indirect proofs of my thesis," says Mr. Berenson, for Savoldo, "if he did not actually begin his career under Alvise, ... began it under Alvise's pupil Bonsignori." Noting that "this theory of Savoldo's descent" he "cannot stop to prove," and that no one before himself has ever made Bonsignori a pupil of Vivarini, let us see how plain-sailing everything becomes.

"In color-scheme the Windsor bust is bituminous, and, having darkened, its effect is remarkably Savoldesque. It is interesting not only because of its great qualities, but also as revealing a phase of Alvise's color which makes us understand whence Savoldo derived his; it being a not over-rare occurrence that a pupil was all his life determined by the one phase, even if momentary, in which he happened to find his master."

Thus, having guessed that the portrait is *not* by Savoldo, its *likeness to his work* is a proof that it *is* by Alvise, and also that Savoldo was Alvise's pupil. Verily, one can prove anything by this method.

Of course we have chosen the weakest points of the argument for our comment, as our purpose is to show how weak such an argument may be. After all deductions, there remain a series of coincidences between the group of painters discussed which lend an air of plausibility to Mr. Berenson's theory, and, as we have said, "establish, at least, its probability." All our instances, also, are taken from the first part of the book. The bulk of the volume, which treats of Lotto's own career, we find little fault with. An occasional temerity in fixing by internal evidence the date of a picture, in spite of the confessed fact that many of Lotto's dated works would, in the absence of the date, have been assigned to an entirely different period of his life—an oversubtlety in finding meanings and interpreting character—these are all one need object to The profound study, the great industry, the wide range and minute accuracy of knowledge which the book displays are worthy of all praise. The author's special acquaintance with his subject is so infinitely greater than our own that we should not presume to dispute his conclusions. The method on which he works is, however, open to examination, and we must conclude that the results of the application of "modern connoisseurship" to the history of art can be accepted only with great caution.

The book is admirably printed, provided with every needful aid to the student, and beautifully illustrated with some thirty plates made from the latest and best photographs, many of them taken from the originals expressly for this work.

AUTHENTIC HISTORY.

History of the United States. By E. Benjamin Andrews, President of Brown University. Charles Scribner's Sons. 1894. 2 vols, 8vo, pp. xxiii, 390; xiv, 341. 5 colored maps.

SELDOM is the task of the reviewer made so easy as in the case of this remarkable work. The hand of the learned author has in the preface analyzed with convenient particularity, under seven numbered rubrics, the merits which characterize this new history of the United States. All that is left for the reviewer is to cull from the pages some passages and extracts which the author's modesty has forbidden him to append as proof-texts; and the work speaks for itself. In the following compilation we have ventured simply to change the order of the seven propositions.

(1.) "The Fore history," we are assured, calls "due attention to what is too commonly missed, the truly epochal character of the adoption of our present Constitution, in 1789.' Since this explanation makes it unnecessary to treat of the foundation and meaning of the immortal instrument, we might fairly chide the author for devoting to an account of the period from 1781 to 1789 eighteen pages of his valuable space—almost a fiftieth of his whole matter, and quite as much as he gives to the Colonial Indian wars.

(2.) "Effort has been made . . . . to render the table of contents a truthful and instructive epitome of our national past." From this in-

teresting category we especially commend to our readers: "Fate of the Mound-builders," "Marco Polo's Travels," "Pocahontas," "Nipmucks Take Part," "Wigs," "The 'Evangeline' History," "Battle of Oriskany," "Redcoats Depart," "Forts Built," "'Tip' 'Levy,' 'Pistareen,'" "The Land of the Free," "Moon Hoax," "Battle of Wilson's Creek," "Hardee Evacuates," "Marble," "Great American Desert," "Horticultural Hall."

(3.) "The following narrative will be found continuous as well as of moderate compass." In no part of the work is this principle better illustrated than in the account of the two civil wars. It appears that after the battle of Bull Run there was a war in the West, beginning with Fort Henry and ending with Johnston's surrender to Sherman in 1865. Thereupon a second war began on the Peninsula in 1862 and lasted through two chapters to Appomattox. So striking an instance of the vitality of two great contestants is uncommon in history.

(4.) "The work strives to observe scrupulous proportion in treating the different parts and phases of our national career." Hence the 78 pages on the military events of the civil-war period are balanced by 82 pages on the United States from 1789 to 1815. Though 12 pages are squandered on Reconstruction, we have 15 on the fisheries dispute. Perhaps the accurate proportions may be better illustrated by two quotations:

"Already President Lincoln was meditating universal emancipation. September 22d the friends of liberty were made glad by a preliminary proclamation, announcing the President's intention to free the slaves on January 1, 1863, should rebellion then continue to exist. It is said that Mr Lincoln would have given this notice earlier but for the gloomy state of military affairs. The day comes. The proclamation goes forth that all persons held as slaves in the rebellious sections 'are and henceforth shall be free.' The blot which had so long stained our national banner was wiped away The Constitution of course does not expressly authorize such an act by the President, but Mr. Lincoln defended it as a 'necessary war measure,' 'warranted by the Constitution upon military necessity.'"

"But as a Titan, towering above all these and all others, stood the great Corliss engine, built by George H. Corliss, of Providence, R. I., one of the most remarkable mechanicians and inventors of the century. A modern Samson, dumb as well as blind, its massive limbs of shining steel moved with voiceless grace and utmost apparent ease, driving the miles of shafting and the thousands of connected machines. The cylinders were forty inches in diameter, the piston-stroke, ten feet. The great walking-beams, nine feet wide in the centre, weighed eleven tons each. The massive fly-wheel, thirty feet in diameter, and weighing fifty-six tons, made thirty-six revolutions a minute. The whole engine, with the strength of fourteen hundred horses, weighed seven hundred tons."

(5.) "I have sought to make more prominent . . . the political evolution of our country . . . and the social culture . . . of the people." How well President Andrews has succeeded is evident from the following quotations: "The political unit of the South [in colonial times] was the parish." "Education was universal [in early Connecticut]." "Legislatures [in the first State Constitutions] were composed of two houses, both elective." This last statement corrects the widespread delusion that Pennsylvania, Georgia, and Vermont had only one house.

(6.) "The volume . . . is believed to utilize, more than any of its predecessors, the many valuable researches of recent years into the rich archives of this and other nations." The result is, of course, the correction of the errors of earlier writers, such as Hildreth, Von Holst, and Rhodes. We have noted some scores of passages which will especially reward the investigator. The singular magnanimity of the Americans in leaving the British flag flying over New York in 1776 had been unnoticed till President Andrews discovered that, in 1783, "the imperial standard of Great Britain fell at the fort over which it had floated for a hundred and thirty years." Singular advantages in the use of French archives not seen by Henry Adams must account for the statements that, "in 1802, . . . had we still been in France's friendship, the two republics might have compelled England's abandonment of that course which evolved the war of 1812"; and that "Napoleon in fact, though not avowedly, more and more receded from his position" on neutral trade. The "twenty-one votes" for Jay in 1800 are not mentioned by any other historian; and Mr. J. F. Merriam's elaborate study into the removals by Jefferson, which he believed to be 99, is superseded by President Andrews's research, which makes the number 39. In correcting the long-standing errors that the Treaty of Guadalupe Hidalgo was made on February 2, 1848, and that gold was discovered on January 24, 1848, the author might well have mentioned the "same day and almost at the same hour" when the two events occurred.

Perhaps the most important result of the use of new sources is President Andrews's discovery of a politician named Douglas who was an important figure in 1854. This is evidently not the well-known Stephen A. Douglas who "didn't care whether slavery was voted up or voted down," and whom not even Lincoln could entrap into a point-blank admission that the people of a Territory could prohibit slavery. This man's namesake was of entirely different stripe, inasmuch as "we may believe that Douglas himself cherished the hope and conviction that freedom was its [Kansas-Nebraska's] destiny"; and "according to . . . Douglas . . . a majority of the inhabitants in a Territory could elect to exclude slavery as well as to establish it." We could wish that President Andrews had told us more about this Douglas.

(7.) "No pains has been spared to secure perfect accuracy in all references to dates, persons, and places, so that the volume may be used with confidence as a work of reference." A very few extracts will satisfy the reader on this important point. "Lief Ericson" is the subject of a saga. "Henry VII. [of England] was a Catholic. He therefore submitted to the Pope's bull which gave America to Spain." "A majority of the Virginia shareholders proved Liberals [about 1619]." "The Colonies further south they [the French in 1689] shut in almost as straitly, French bullets whistling about any Englishman's ears the instant he appeared beyond the mountains." [After Pontiac's war,] "At the call of the rich and now free Northwest, caravans of English immigrants thronged thither." "Next came three alien acts [in 1798]." "[Jefferson] overdid simplicity in going to the Capitol on horseback, tying his magnificent horse, Wildair, to a tree with his own hands." "The Russian campaign practically finished Napoleon's career." "The dominant wing of the Democratic party . . . forcing a demand for this [annexation of Texas] into their national platform in 1840." "In 1879 both houses of Congress were Democratic by small majorities, for the first time since 1856." "The negro vote, now that it had become a fixed fact, was little by little courted by the jarring factions, and hence protected." "Previously to 1870 the [negro] race had been constantly decreasing in fecundity." "The most stupendous work yet accomplished by man, the great bridge spanning East River." Such interesting quotations might be multiplied; but they would not add to the reader's conviction as to the unexampled carefulness of the work.

Although the author does not include the charm of his style as one of the seven cardinal virtues, it would be ungracious not to let him speak for himself in a few quotations. "Charles II. was a much meaner man than his father, and James II. was more detestable still." "All prisons were frightful holes which we would as lief die as enter." "A weaker commander would now have given up, but Wolfe had red hair and the grit usually accompanying it." "In 1855 this party assumed national proportions and worried seasoned politicians not a little: but, having crystallized around no living issue, like that which nerved Republicanism, it fell like a rocket-stick, its sparks going over to make redder still Republican fires."

The maps also are briefly mentioned by the author, although they deserve all the commendation that we have given to his book. We can hardly suggest a more fruitful exercise in historical geography than the correction of the previous studies of this kind in the light of President Andrews's maps. We question whether the boundaries of many of the States will not have to be resurveyed to correspond with these new discoveries, which are nowhere else recorded. In short, American history has taken on a new aspect since this novel work has appeared.

GREEK AND LATIN CONDITIONAL SENTENCES.

The Theory of Conditional Sentences in Greek and Latin. For the use of students. By Richard Horton-Smith, M.A., Q.C. Macmillan & Co. 1894.

Mr. Horton-Smith's bulky book transports us to the year 1859 and invites a retrospect. It was in 1860 that Prof. Goodwin put forth his memorable treatise on the 'Greek Moods and Tenses,' which, in a comparatively short time, gained an authoritative position in the domain of Greek scholarship. To English classical scholars it was little short of a revelation. Based in large measure on Krüger and Madvig, it brought the best results of the thought and observation of two of the soundest Continental grammarians within the reach of Britons, who have always been slower than Americans to appreciate and apply foreign work. And then, Krüger and Madvig were interpreted by a congenial spirit. Clear, acute, and sensible, free from over-refinement and over-subtilty, Prof. Goodwin's work is calculated to commend itself to the Anglo-Saxon type of mind.

Outside of Krüger and Madvig, Prof. Goodwin owed little to other scholars. Even so important a work as Bäumlein's, published in 1846, was unknown to the author of the 'Moods and Tenses' in 1860, so that Goodwin's own contributions to the subject, especially his well-known analysis of the conditional sentence, may be regarded as his personal achievement, in spite of anticipations, total and partial. In the revised edition of 1890 there is evidence of wider reading in grammatical literature, and a certain concession to the new points of view that have been introduced into syntactical research since 1860. The syntax of to-day demands a finer psychological analysis and a

more exact observation of historical evolution than the syntax of forty years ago, and Prof. Goodwin's thorough revision of his book, which would have retained much of its value without revision, has made it indispensable to every classical scholar—how much more to every grammatical investigator.

Now Mr. Horton-Smith's attitude towards Goodwin, not the Goodwin of 1890, but the Goodwin of 1860, is one of the most astonishing instances of British insularity and doggedness that can well be imagined. In 1859, it seems, Mr. Horton-Smith, then Fellow of St. John's College, Cambridge, and Classical Lecturer of King's College, London, put forth 'An Outline of the Theory of Conditional Sentences in Greek and Latin for the Use of Students.' Soon after this publication Mr. Horton-Smith fixed his mind on law's grave study, and what he has done in the last thirty-five years has simply been by way of amusing his leisure hours. "Published," he says, "as the professor's book was, after the present writer's former publication and after the cessation of his official connection with the teaching of classics, an acquaintance with the results of the American scholar's labors was unnecessary." And yet he clings to the old title, "For the use of students." To be sure, there is much that students can use, if sufficiently advanced to profit by the mass of material, but as a manuduction into the theory of the conditional sentence the work is strangely behind the times. The plan, presumably the same as that of the original outline, consists in framing a number of conditional sentences which the author considers theoretically possible, and then finding examples to fit. Of course, the more categories filled the merrier, and a prejudice is established in favor of all manner of "sports" that are due to inferior MSS. and to indulgent grammarians. Out of the ranges of Greek that he has traversed, Mr. Horton-Smith has managed to fish up a number of monsters, especially out of the turbid waters of the Hippocratean *corpus*, and these he has steadily refused to have cleansed, lest perchance the removal of the slime should reveal a commonplace mullet or an every-day flounder.

Each example is accompanied by a translation, and these translations are not the least interesting part of the book, pathologically and otherwise. Happy equivalents of Greek and Latin turns of expression are not lacking; but when we come to the rendering of the Greek and Latin conditions, Mr. Horton-Smith's scheme makes itself felt, and we have to encounter every form of lumbering and unidiomatic periphrasis, and find ourselves in the limbo of those ungrammatical souls who think that translation is an end of controversy. "If haply" and "if truly" for εἰ with subjunctive and ἐάν with subjunctive are not convincing formulæ. The day is past when Gottfried Hermann could make the world believe in his plan of rendering imaginary distinctions in Greek into Latin that was itself imaginary. The syntactician of to-day has his own weaknesses, but they lie in a different direction. To him a translation is an illustration merely, not a proof.

One pleasant and not uninstructive peculiarity of Mr. Horton-Smith's is his loyalty to the great scholars of his youth; and his familiarity with the writings and the personal teachings of such men as Key and Malden and Shilleto, to whose "dear memories" the book is dedicated, has enabled him to emphasize the points in which those independent thinkers have anticipated recent research. And, after all, it is well that the *epigoni* should not be allowed to think too highly of themselves, and that they should have it borne in upon them that the results of painful investigation have been foreseen by scholars of an earlier type, whose vision was keen and whose common sense was strong, however deplorable their methods. But we have got beyond the stage of "guesses at truth" and penetrating divination. Nothing will serve nowadays except exhaustive induction, and each sphere is sharply separated from every other. The modern syntactician has to count with history, has to count with psychology. He has to study dialect and period, has to watch the bounds of conventionality in the orators, and to make allowance for fun and freakishness in the comic poets. There is no one Greek or Latin syntax; there is a syntax for every period, for every province of literature, for every individual in that province. What is perfectly conceivable for Homer is inconceivable for Aristophanes. A solecism that is comprehensible in the New Testament would be incomprehensible in an Attic orator. A hyperepic construction in a tragic poet is one thing; in a normal prose-writer a hyperepic construction would be an impossibility. Of course, Mr. Horton Smith has to admit that some of his theoretical combinations are very rare in standard Greek, and finds himself forced to plead for chance survival. But the survival that he pleads for is often nothing more than the oversight or the blunder of the scribe.

But it will be clear to every one who has any right to a voice in matters grammatical that Mr. Horton-Smith belongs to another syntactical world than ours. In fact, to him the light of modern grammatical study, as it has reached him through notes in the various editions he has read and through such a very dubious medium as the syntactical essays in the *Classical Review*, is simply an impertinence. Delbrück does not seem to be known to him, nor Lange, except by a second-hand quotation. There has been no systematic effort on his part to master the processes of the grammatical thought of the last forty years, and we must be satisfied with what he has chosen to give us out of his fifty years' collections. Much of this will be welcome to the explorer. His copious English, French, and Italian parallels and illustrations show a wide range of reading, and an appreciation of the importance of selecting readable specimens; and he who has leisure to turn over Mr. Horton-Smith's commonplace-book will have glimpses that will make him less forlorn, which is more than can be said of most grammatical treatises. For our veteran is as tangential as that other veteran, J. E. B. Mayor; and when one is in despair about ἄν with the future indicative and the passiveness of the future middle, and ἦν with the present indicative and the untenableness of Dawes's canon, and all the other well-worn themes, one is refreshed by the remark that "lines of three words are common in Dante," is aroused by the query whether a certain passage in Fielding might not have been suggested by the close of Sir Thomas Browne's "Urn-Burial," and is diverted by a collection of passages from various literatures in support of the unquestionable thesis that what has been done cannot be undone. The book, despite what the narrow student of to-day would call its lack of scientific character, is steeped in the charm of studious leisure, and there are many *obiter dicta* of native good sense, to which some rampant theorists might even now give heed; so that, beginning with astonishment, the reviewer ends with a certain pious regard, and would sooner wish his review undone than the book itself. But both, as we have learned from Mr. Horton-Smith, are alike impossibilities.

A Sporting Pilgrimage. By Caspar W. Whitney. Harper & Bros. 1895.

In this handsome and well-illustrated volume Mr. Whitney gives the results of a careful investigation of various forms of sport carried on to-day in England. Either by personal participation or in the capacity of a skilled onlooker, he has acquired an accurate idea of English methods as applied to cross-country riding, rowing, football, track athletics, cycling, cricket, and golf; and while some of his views on these subjects may seem open to question, the picture he draws is, on the whole, a very fair one, and is full of interest to American readers.

Mr. Whitney holds very strongly to the opinion that sport of all kinds deteriorates when the professional element controls, and this result is generally brought about by too much attention to gate-money, and by laxity in the rules which define the amateur's position. Regarded from this point of view, the sports to which Mr. Whitney devoted his time in England fall into two classes. In the first are rowing, cricket, and golf, which are, comparatively speaking, in good odor; and in the second, football, track athletics, and cycling, which are full of scandals. Mr. Whitney goes so far as to say that, outside of the universities and a very few clubs, there is no honesty in track athletics in all England. Football, especially the Association game, is mainly played by professional teams, while bicycle-racing is in as bad repute in England as it is here, and for the same reason, namely, lack of courage on the part of officials in dealing with the amateur question.

It is not, however, in discussing these semi-professional sports that Mr. Whitney's views merit attention so much as in the comparisons he institutes between university sports in England and America. He maintains, with much show of reason, that in these matters we have a good deal to learn from our English cousins. He shows, for instance, that in the English universities there is not the all-absorbing interest in the result of contests that we are accustomed to here. The English undergraduate enjoys the delights of victory, or bears the bitterness of defeat, in a much calmer and more philosophical manner, and with a clearer perception of the relative importance of such events, than the American. Then, again, there is in England an entire absence of the hard commercial atmosphere which envelops our big football games, and which introduces a very undesirable element into undergraduate life. Another obvious difference is in the absurd and childish mystery which surrounds the daily practice of our leading 'varsity crews. We read with a feeling akin to shame of the tricks which are played every year at New London by the rival crews in the endeavor to conceal their own and discover their opponents' doings. How much better is the English method of letting all the world know the time made in practice, and anything else that is of general interest. Again, the English system of training is much more sensible than ours. Our college men devote altogether too much time to training, with the result that our teams and crews are generally overtrained, as was the case with the Yale team that succumbed to Oxford last summer. In some respects, however, Mr. Whitney considers the American collegians superior. He found the Rugby game of foot-

ball as played in England very inferior in the skill and science displayed to the game played by our leading colleges, and the form of their 'varsity track athletes, except in distance running, does not average as good as ours. Apropos of football, he discovered in an old English history of the game that, among other reasons given for the belief that the world was coming to an end in 1583, was the fact that "football-playing and other devilishe pastimes" were occupying too much of the people's attention. Verily, there is nothing new under the sun.

Mr. Whitney's account of cricket in England is perfunctory and uninteresting. That the game has been free from scandals, although largely played by professionals, he believes to be due to the fact that there has been no sailing under false colors, and that the line of demarcation between the amateur and the professional is clearly marked. We rather incline to the theory that the slow movement of the game—a feature which places it at the end of the sporting scale furthest removed from racing—makes it a poor medium for betting; and where betting enters, scandal is quite sure to follow. That there is something elevating in the nature of the game is an idea that is pleasing to cricketers, but we have known rascals who played good cricket, as we have also known gentlemen who played good football. The truth, of course, is that it is possible to play any game in a sportsmanlike or an unsportsmanlike manner.

Mr. Whitney's language is occasionally careless and obscure. He uses *smithy* for *smith*, and describes an event which happened *somewhere along* 1820, and he rechristens one of the English shires *North Hamptonshire;* but in spite of such blemishes he has produced a pleasant and readable book.

Musicians and Music-Lovers, and Other Essays. By W. F. Apthorp. Scribners.

THE number of books on musical topics annually issued by American publishers is becoming almost as great as the number issued in Germany, and if their average of scholarship is perhaps less high, the American books are as a rule better written and more entertaining. The question has recently been much discussed whether the ideal musical critic should be a musician who can write, or a writer who understands music. It cannot be denied that the most valuable criticisms on music were written by composers—Berlioz, Schumann, Wagner, Liszt; nor, on the other hand, can it be denied that, as a rule, professional musicians are too prejudiced and too deficient in general culture to make good writers on their art, except on technical points. After all, it seems sensible to assume that a critic whose duty it is not to compose but to write for newspapers and book-readers, should be first of all a journalist and author. He need not be able to compose a symphony or even a waltz, but he should know everything about the anatomy of compositions and—keep that knowledge carefully to himself; for nothing is more futile, useless, and tiresome to a general reader of musical notices and books than the habitual elaborate analyses, with examples in musical type, which are to musical criticism what parsing is to literary criticism. The greatest musical critics are not addicted to the habit of parsing, unless they have a private class-room, where it is quite in place.

It is gratifying to find that Mr. Apthorp does not indulge in any parsing in this volume of musical essays, though he might easily have done so, as he has a thorough knowledge of musical technique; gratifying, also, to find that he does not resort to the hair-splitting which is the one conspicuous fault of his newspaper criticisms. He has collected here nine essays which form a real addition to our musical literature. They cover a wide range of topics, as is shown by the titles—"Musicians and Music-Lovers," "J. S. Bach," "Additional Accompaniments to Bach's and Handel's Scores," "Meyerbeer," "Offenbach," "Two Modern Classicists," "J. S. Dwight," "Some Thoughts on Musical Criticism," "Music and Science."

Perhaps nowhere else, certainly not in the English language, could there be found such a clear and cogent exposition of the question of additional accompaniments as Mr. Apthorp has made. The question is really one of genius versus pedantry, of artistic taste versus dry archæologism. A mere enumeration of the names would prove this—Mozart, Rheinberger, Liszt, Franz, on one side, Spitta, Chrysander, Joachim, and Brahms on the other. All admit that there are works of Bach and Handel which require additional accompaniments, such as those masters themselves used to supply at the organ or harpsichord; the question is what those accompaniments should be—Franz and his party claiming that they should be polyphonic, like the works which those masters completely wrote out, while the pedantic group insist on the use of mere plain harmony, which is entirely foreign to the mode of composition in that day. On this point Mr. Apthorp's argumentation is absolutely incontrovertible, and he still further drives in the nail by mentioning the significant fact that the archæologico-historical party carefully omitted from their discussions the attitude assumed by Mozart. They could resort to the tactics of denying that Liszt and Franz were men of genius, since they were still living and therefore (*more Germanico*) underrated; but they could not pursue those tactics toward Mozart, knowing as well as Otto Dresel that "Mozart's opinion of what is right to do for Handel is worth that of a hundred thousand professors of musical history." Admirers of Brahms, Joachim & Co. may profitably study page 127 of Mr. Apthorp's book, and peruse, on page 234, the letter to him by Franz, in which the historic party's bad musical grammar is mercilessly exposed.

Several private letters from Franz to Mr. Apthorp are published in the article on "Two Modern Classicists," and are welcome contributions to the scant biographic material relating to that great song writer, whose wonderful genius was so little understood by the Germans, even at his death, that only a few papers published adequate obituary notices of him. The first Franz apostle in America was Otto Dresel, who also wrote a small volume of good songs, entirely in the Franz vein. Mr. Apthorp gives an entertaining character-sketch of this unique Boston musician, regarding whose relations to Franz he says:

"They were stanch and life-long friends; their agreement on musical subjects was as complete as their friendship; they both worked together towards the same end, though they lived long apart; neither of the two gave anything to the world without its passing through the ordeal of the other's criticism; they died within two years of each other."

Throughout these papers Mr. Apthorp speaks of Bach and Handel as if they were composers of equal worth and rank; but in the special paper on Bach he shows that therein he merely follows the force of habit, and that in his heart he knows how much the greater genius Bach is. He compares him to Dante, and applies to him Lowell's dictum that "his readers turn students, his students zealots; and what was a taste becomes a religion." Mr. Apthorp's own confession of faith is that of many music-lovers:

"The love of Bach is the most enduring of musical passions; I know that I can hardly open a volume of Bach without a certain feeling of superstitious terror; I feel as if the perusal of each page would be but a nail in the coffin of all my other loves. No matter what your enthusiasm for other composers may be, there comes a time when long communion with any one of them breeds satiety, and you cry for change; but you can return to Bach every day, and each time you find him greater, more wonderful, more all-powerful than before."

A passage like this shows that Mr. Apthorp understands the highest function of criticism, which is to arouse enthusiasm for what is best in art. He himself says: "What the critic *knows* is valuable to himself mainly; it is what he *thinks* and *feels* that is valuable to others." He might have added that while a critic may not be able to arouse the same emotion in the reader's mind as the work discussed, he can, if he is a good writer, arouse such enthusiasm that the reader will feel eager at once to hear and study the work praised. If music were really a popular art, the highest function of criticism would be to establish cool and impartial judgments; but since the best in art is usually born to blush unseen for a long time, the best thing by far that the critic can do is to discover this best and arouse enthusiasm for it. This Mr. Apthorp does in his admirably written volume, and that constitutes its chief value. It will incline its readers to study and love Bach and Franz, and to despise Meyerbeer and Offenbach, who, by a strange freak of fate, were destined to set the fashion in opera and operetta for France during a whole generation. They were mere froth on the ocean of which Bach and Franz are the permanent waters, whose treasures only deep-sea dredging can reveal.

BOOKS OF THE WEEK.

Annesley, Charles. The Standard-Operaglass: Detailed Plots of One Hundred and Fifteen Operas. 9th ed., revised. London: Low, Marston & Co.; New York: Westermann.

Bradley, Prof. C. B. Orations and Arguments by English and American Statesmen. Boston: Allyn & Bacon.

Cotes, Mrs. Everard. Vernon's Aunt. Being the Original Experiences of Miss Lavinia Moffat. Appletons.

Dippold, Prof. G. T. A Scientific German Reader. Boston: Ginn & Co. $1.

Ellis, E. S. Among the Esquimaux. Philadelphia: Penn Publishing Co.

Fontaine, C. Les Historiens Français du XIXe Siècle. W. R. Jenkins. $1.25.

Goldsmith, Oliver. The Deserted Village, etc. Boston: Houghton, Mifflin & Co. 15 cents.

Half-Hours with an Old Golfer. London: George Bell & Sons; New York: Macmillan. $1.25.

In the Heart of the Bitter-Root Mountains. The Story of "The Carlin Hunting Party." Putnams. $1.50.

Jackson, Rev. S. M. The Book of Job. Maynard, Merrill & Co. 25 cents.

Ladd, Prof. G. T. Philosophy of Mind: An Essay in the Metaphysics of Psychology. Scribners. $3.

Moore, Dr. E. Tutte le Opere di Dante Alighieri. Nuovamente rivedute nel testo. Oxford: University Press; New York: Macmillan. $2.25.

Murray, J. A. H. A New English Dictionary on Historical Principles. Deceit—Deject. Oxford: Clarendon Press; New York: Macmillan. 60 cents.

Nevinson, H. W. Slum Stories of London. Henry Holt & Co. 75 cents.

Otis, James. Chasing a Yacht. Philadelphia: Penn Publishing Co.

Palmer, F. L. The Wealth of Labor. Baker & Taylor Co. $1.

Pinero, A. W. The Second Mrs. Tanqueray. Boston: W. H. Baker & Co. 50 cents.

Raymond, Prof. G. L. Rhythm and Harmony in Poetry and Music. Putnams. $1.75.

Strachey, Mrs. Richard. Poets on Poets. London: Kegan Paul, Trench, Trübner & Co.; New York: Scribners. $2.

Swan, Annie S. Airlie's Mission. Hunt & Eaton. 50 cents.

Tirebuck, William. Sweetheart Gwen. Longmans, Green & Co. 50 cents.

Trask, Katrina. Sonnets and Lyrics. Randolph.

Tyler, Prof. W. S. A History of Amherst College from 1821 to 1891. Frederick H. Hitchcock. $1.50.

Wagner, Capt. A. L. Organization and Tactics. B. Westermann & Co.

Warner, Prof. A. G. American Charities: A Study in Philanthropy and Economics. T. Y. Crowell & Co. $1.75.

The Nation.

NEW YORK, THURSDAY, JANUARY 31, 1895.

The Week.

THE special message which President Cleveland sent to Congress on Monday has exactly the right tone. There may be differences of opinion as to details here and there, but the main proposition is so sound that it constitutes a rallying-point for all the defenders of the public credit and for all the believers in an honest dollar. This proposition is that the dollar is 25 8-10 grains of gold of standard fineness, that the Government's paper of all kinds must be redeemed in it, and the Government's debts of all kinds must be paid in it or its equivalent. This proposition, we say, is now the rallying-point for all the friends of sound money. Moreover, it is something that they cannot avoid or shirk, because business considerations will overtop politics in spite of all the partisans and the harlequins (of whom the *Tribune* is a type) who are dancing around the bonfire of the public credit. The first thing to be done is to sell gold bonds. We want gold; therefore, we ought to promise gold.

The speech of Chairman Wilson on Saturday gives some reason for believing that the revenues of the Government will soon be, if they are not now, in excess of the expenditures. His prediction, however, depends on the productivity of the income tax, no part of which need be actually paid before the 30th of June. As each person will desire to avail himself of any decision of the courts which may be made against the constitutionality of the tax, the payment will, as a general rule, be put off till the last day. There is enough time intervening to exhaust the gold reserve of the Treasury twice over, especially since the element of distrust forms so large a part of the existing trouble. How large a share this is may be seen by the fact that $30,000,000 of the gold withdrawals has been for other purposes than exportation. A drain of this kind is even more perilous than a drain for exportation, because the latter has its limits, while distrust has no limits. A failure to meet the demand for gold, whether it proceeds from one cause or another, is bankruptcy. This must be guarded against at all hazards. It is a sad comment on the situation, that even now, while the Government cannot meet its own debts promptly, and is straining every nerve to maintain specie payments, the Senate should pass a bill to lend the Government's credit to the amount of $70,000,000 to a canal in a foreign country, at a time when that credit is so greatly impaired.

Mr. Wilson's suggestion that if some means could be devised for requiring a portion of the customs dues to be paid in gold without withdrawing it from the Treasury, the present trouble would be cured, compels us to say that no such means can be found. The problem confronting the Treasury is the maintenance of gold payments. This means that the legal-tender notes shall be paid in gold on demand. Consequently, any law requiring the payment of customs duties in gold, in whole or in part, would merely put the importers to the trouble of drawing gold from the sub-treasury before paying it to the collector of customs. Moreover, is it supposed that Congress will pass a law degrading the silver dollar by not allowing it to be received for customs duties? No. In the first place, the silver-men would never consent to this. In the next place, the Government ought not to, because it has received the value of a gold dollar for every silver dollar outstanding. To turn around and repudiate its own dollars would be an act of turpitude quite inconceivable.

We have felt all along that it was a mistake not to call in McKinley to show us the way out of our troubles. It is all very well for Secretary Carlisle and Senator Sherman and the Baltimore bankers to bring forward their plans, but there is an appearance of effort about their work. What we long for is the easy mastery of genius and the creative imagination, and this McKinley always gives us. He gives it to us, we are happy to say, in the address which he made last week before a manufacturers' convention at Cincinnati. After all the strain and fretting of the financiers and Congressmen, how refreshing it is to have a perfectly clear solution of the vexed problem given us in two limpid sentences. McKinley says that all we need is "our own markets for our manufactures and agricultural products," and then, in addition, "a foreign market for our surplus products, which will not surrender our markets and which will not degrade our labor to hold our markets." This is one of those great principles which only a genius can discover, but which everybody must see to be true the moment they are enunciated. A man with a shovel in a ditch would be forced to assent to McKinley's idea as soon as it was stated to him, and would have just as clear a notion as the Ohio statesman has of the way to go to work to carry it out.

The Nicaragua Canal bill, after using up all the available time of the Senate since December 1, has passed that body at last. Doubtless its promoters themselves do not expect to see it pass the House this session. Speaker Crisp has intimated that the committee on rules will not make a special order for it, and, in default of that, there is no hope for it. What Senator Morgan and the other backers of the enterprise have been making their nine-day speeches for is mainly to give the bill prestige for the next Congress. On the other hand, its opponents in the Senate and in the press have not been as earnest and incessant in attacking it as they would have been if its enactment into law had seemed imminent. Thus there has been but languid interest in the debate so far. For our part we should regret to believe that this or any other Congress would commit our Government to the backing up of a purely business undertaking to the extent of $70,000,000.

The patriots in the Senate gave the British a brief respite on Saturday, while they turned to rend the *Evening Post* for having published a Washington despatch in which reference was made to an Hawaiian bond syndicate in the background. We printed that rumor for what it was worth, and alluded to it only as furnishing what the scientists call a good working hypothesis. The necessity of some explanation for the corybantic rage of Lodge and Frye about Hawaii is clear to every man. A slight acquaintance with great principles, such as *omne vivum ex ovo*, is enough to convince everybody of that, and we welcomed the bond story in a purely scientific spirit, thinking that it gave a better idea of the meat in the egg than any other theory we had seen. But now Lodge has robbed us of this working hypothesis, and where shall we turn? He himself admits that the phenomenon is a puzzling one. He vowed that his own motive was simply that spirit of shining patriotism and sublime self-forgetfulness in which he approaches all public questions, but confessed that he did not expect people to believe that. A wicked world, he knew, was too fond of thinking evil of our best and noblest to allow him to escape. He was willing to suffer and be strong.

Another Hawaiian mystery hard to be accounted for is the fatuity of the Republicans in solidifying Democratic sentiment against their annexation schemes. All they have accomplished for the present is to get a resolution passed in the Senate declaring for "absolute non-interference," and praising President Cleveland for following that policy in foreign affairs. All the Democratic Senators voted for that resolution, and one Republican with them. This is a triumph for the Cuckoos—who somehow always turn out to be in a majority, in spite of their being such a wretched handful day after day in

the *Tribune* and the *Sun*—and is really a desperate blow to the annexationists. How are they going to muster, on this showing, the two-thirds vote in the next Senate, or the one after the next, requisite to pass a treaty of annexation? The real reason why Harrison's scandalous treaty of annexation failed was because it could not pass the Senate. The Republicans are now doing their best to prevent any such treaty from passing a future Senate. In trying to make exclusive party capital out of Hawaii, they are overdoing the business and making it practically certain that, even with the next President, they cannot annex the islands. As this fact sinks into the minds of the patriots, they will have no resource except to shout again, "What ho! a Briton to the rescue!"

North Carolina has now a Republican as one of her Senators at Washington for the first time in nearly twenty-two years. John Pool, the last representative of the party during the reconstruction era, retired on the 4th of March, 1873, and both seats have since then been filled by Democrats until Mr. Pritchard, a Republican, was sworn in on Thursday as the successor of the late Senator Vance, whose term ran until 1897. On the 4th of March next Mr. Pritchard will be joined by another Republican from a Southern State, Steve Elkins of West Virginia, the first member of the party from that State since Boreman's term expired twenty years ago. A quarter of a century ago the South was almost solidly Republican. Leaving the old "border States," Delaware, Maryland, Kentucky, and Missouri, out of the account, every one of the remaining twenty-four Senators from States in which slavery had existed was a Republican, except one each from Virginia, Georgia, and Tennessee. In ten years all of these twenty-one seats were occupied by Democrats except one from Louisiana; and when Kellogg's term ended in 1883, the South became solidly Democratic in the Senate—except for the two Virginia "Readjusters"—so to remain for a dozen years.

The reappearance of a Republican from North Carolina is not a cause for unmixed rejoicing by the party. The Republicans in the Legislature of that State number only 64 of its 220 members, and Mr. Pritchard's election for the short term was part of a bargain by which the 100 Populists agreed to support him for that place if the Republicans would help choose a Populist for the long term, to succeed Mr. Ransom in March. The fusion between the two parties appears to be complete, and arrangements have already been made by the managers for a union of their forces in the Presidential election next year, the electoral ticket to be divided between them. Such an alliance must necessarily embarrass the Republicans in Congress. The Democrats have suffered terribly from their fusions with Populism in 1892, by which they helped to elect Lewelling Governor in Kansas and Waite in Colorado. The Republicans will find the gain of one Senator from the South very dear if it costs them such loss of confidence as befell the Democrats for their similar coalitions with the third party in the West.

It is quite plain that Gov. Morton is not resting comfortably under the assumption which Platt makes in his Lexow police bill that the Governor is a better Platt man than Strong is. He caused it to be made known on Wednesday week that he is not in favor of the Lexow proposal to take away from Mayor Strong and bestow upon himself the power of appointing a commission to reorganize the police force of this city. That proposal is the most impudent of Platt's recent acts, and there is no explanation for it except that the mayor is too much of a reformer to be trusted by the boss. In preferring the Governor publicly as the appointing power, Platt did not stop to ask himself how the Governor might like to be held up before the people of the State as "Platt's man." He has found out now that the Governor does not like it at all and will not tolerate it—an outcome which might have been foreseen, and which is of incalculable value to the Governor's fame.

About Judge Gaynor's mandamus declaring the holders of a public franchise bound to exercise it under all circumstances, all there is to be said is that it may be good law, but it is not common sense. No railroad franchise was ever granted or accepted under the condition that the road is to be worked come what will. Even ships' charters provide for stoppage or loss by the act of God or the public enemy. This is understood in every land carrier's contract also. Inundations would exempt him in the minds of rational men. So would unreasonable strikes. Unreasonable strikes by large bodies of men—"sympathetic strikes," say, to help other strikes in some distant place, like those of last summer—are now as much one of the risks and impediments of transportation enterprises as floods or fires or highway robbery. Any judge who lays down the law about the duties of the holders of a railroad franchise ought to put in a word for the "horse" or business sense of the community. Judge Gaynor must know very well that it would be impossible to carry on any railroad in America if it were the law that it must forfeit its charter if, even for a day, it failed to run its trains, for then the employees would have it at their mercy. How unscrupulous they can be under such circumstances is shown by the recent strike of the linemen in Brooklyn in spite of a formal written contract. Judge Gaynor's assumption that the Brooklyn roads must have all the protection they need to run their cars on schedule time because they have 7,000 soldiers, and that, therefore, their failure to run them is "unlawful" and "by its bad example tends to public disquiet if not to some disorder," seems to have been taken from the work of some humorist. If meant seriously, the attention of strategists ought to be called to it, because it shows that if you send 10,000 men after an enemy who has only 7,000, you may consider him beaten and call home your own troops. Judge Gaynor evidently considers that when mandamuses come into collision with facts, facts go to the wall.

The letter in which ex-Gov. Pattison of Pennsylvania accepts the Democratic nomination for mayor of Philadelphia is an excellent statement of the principles that should control the administration of municipal affairs. He declares his conviction that, "in order to secure an honest, intelligent, business-like management of our city government, there must be an absolute separation of municipal affairs from State and national politics," and promises that, if he is elected, "merit, and merit alone, shall be considered in making appointments, and no removals shall be made except for cause." He shows how the city has suffered from the participation of its officials and employees in local politics, and engages to "absolutely prohibit and prevent it." He points out the startling growth of extravagance, the expenditures of the city government having increased from $17,638,304 in 1887 to $32,190,000 in 1894, and promises to "promote and enforce economy in the departments." Nor are these mere words which sound well but carry no weight. Ex-Gov. Pattison has been long in public life. Always a Democrat, he has twice been elected a city official in Republican Philadelphia, and has twice served a four years' term as Governor in a Republican State. In each of these four elections he owed his success to the votes of Republicans who had confidence in the man, and he has always justified their confidence. He has the ability and the courage to make such a mayor as the city urgently needs to check the growing demoralization of its government, and it is to be hoped that there will be independence enough among the voters to give him the opportunity.

Commissioner Roosevelt has an article in the February *Atlantic* on the present status of civil-service reform, in which he puts together some of the facts showing "definite, tangible progress." With the extensions of the law made in the past two years by President Cleveland, the number of federal officials now under the protection of the law is about 50,000. The phrase under protection of law is the right one to use. Formerly the men who were supposed to be servants of the public were in reality the servants of the politicians who put them in office, and had no shield against their im-

perious demands for personal service and pecuniary contributions. What the civil-service law has done for these officials is simply to put them in the same category with other citizens, relieving them from forced labor for bosses and levies on their salaries. For the public service, on the other hand, the law has secured the whole time and industry of the men who before had to serve two masters, the Government and the boss. Mr. Roosevelt instances the present high efficiency of the railway mail service, as the best of all possible object-lessons in regard to the successful working of the merit system. In short, civil-service reform has now become simply a business proposition, and all we need to secure its application to all branches of the public service is a widespread demand by the business men of the country that common sense shall rule in Government as well as private affairs.

The first question that one involuntarily asks on reading Pope Leo's encyclical on American affairs is: Why must a Pope be so platitudinous? Is it worth while to write out in Latin, and pay customs dues for the privilege of laying before the people of this country, such sentiments as, "Divorce scatters the seed of discord among families"; "It is important that citizens should be virtuous and upright"; "America seems destined for greater things"? The encyclical as a whole is filled with truths of that kind, which it never entered into the heart of man to question. There are some paragraphs rapping Catholic journalists over the knuckles for daring to say anything about their bishops, and addressing apostolic rebukes to those prelates who "pry into the counsels and conduct of another"; but the great body of the letter is filled with platitudes which nobody but a Pope would think of uttering with such solemn emphasis. This is one of the disadvantages of being infallible; you must say only what everybody agrees to be true. Dean Stanley had an interview with Pope Pius IX., and came away saying that the infallible man had made more blunders in a twenty-minutes' conversation than any person he had ever met. It was because Pius attempted to display an intimate knowledge of English affairs. He spoke, for example, of Wilberforce as a professor at Oxford, which saying, when reported to the Bishop of Oxford, brought from him the exclamation, "What astounding ignorance!" So that Leo has, after all, been wise to confine himself to safe generalities in treating of things American. We may doubt the necessity of earnestly telling us what we all knew before, but nothing in the encyclical will throw the least doubt on the doctrine of papal infallibility.

Mexican Jingoes—of whom there is a goodly crop—would doubless like to have a glorious war with Guatemala, but the chances appear to be that they will have to take the glory without the war. The comparative weakness of Guatemala would lead that country to do anything in reason to avert actual hostilities; and against doing anything outrageous in this boundary controversy, Mexico appears to be in honor bound by the treaty of 1882 referring to it. In case of irreconcilable disagreements between the two countries as to their dividing line, explicit covenants were entered into to refer the dispute to arbitration, the President of the United States being the chosen arbitrator. Secretary Gresham, doubtless acting under this agreement, and having, it is said, first made sure of a favorable reception of his proposal, has proffered the good offices of this country to bring about a peaceful solution of the difficulty. It is, therefore, reasonable to suppose that the war flurry will soon subside.

M. Bourgeois (ominous name!) has had to give up trying to form a cabinet; and no wonder. Men of any ability or political ambition must have got tired, by this time, of being put up as targets for a chaotic Chamber to shoot at, with the certainty of being brought down sooner or later. That Deputy who, in the assembly lately convened to elect a new President, proposed that first the French Constitution be amended so as to make it worth any man's while to be elected President, deserved a more patient hearing than he got. The present system is getting unworkable. Yet it is doubtful if any other system would help matters much. Better men could make the present bad system work, and the present men would soon break down a better system. The plague of France is the fearful decay in the character of her chosen representatives. That is the plague, also, it must be confessed, of all existing democracies. John Stuart Mill said that he entered Parliament with what he thought to be the lowest possible opinion of the average member, but quitted it with a lower opinion still. The House of Commons has grievously fallen off since his day. On the spectacles at Albany, at Trenton, at Washington, what American can look with complacency? Neither for us nor for the French or English is salvation to come through any system or lack of it. Until intelligence and honesty come to be applied to legislative business, it will continue to suffer as much as any other business would if put into the hands of ignorance and greed.

The Italians seem to be having a hard time of it in their colony of Eritrea, where they are at war with both Christians and Mohammedans, the Mahdists and the Abyssinians. On the one hand we hear of a threatened Mahdist invasion whose object is to recover Kassala by a supreme effort; on the other, we read of battles with Ras Mangascià, the chief of Tigré and son of John, the late Negus. The two fields of action can hardly be less than two hundred miles apart in a straight line, and the country between them is mountainous. No wonder that Gen. Baratieri is "in urgent need of reinforcements." Of course there is no doubt of the ultimate triumph of the Italians. They will gain glory, and very possibly, for military or other reasons, will deem it necessary to extend further the limits of their territory. Unfortunately, reinforcements, glory, and extension of territory are expensive. The money for them will have to come from a nearly bankrupt government, out of the pockets of terribly overburdened taxpayers. Eritrea is in some ways a valuable and promising possession, but it has already cost many millions, and is not likely, with the strictest economy, to pay its way for a long time to come. This may be but a drop in or rather out of the bucket of Italian finances, but before that time arrives who can say what will have happened to them and to Italy?

The Melbourne correspondent of the London *Economist* gives some interesting particulars of the new taxation which the colonies of Australia are now proposing. Victoria, for example, proposes to put a tax of 1d. for every pound sterling of the "unimproved value of land." If this land is mortgaged, then the owner and the mortgagee thereof shall be liable for the tax in proportion to their interests. In case the owner of land has been an absentee from Australasia for three years or more, the rate of taxation shall be increased 20 per cent. The income tax is divided into two portions: income from personal exertion and income the produce of property. In the first instance there is a tax of 3d. for every pound sterling for incomes over £200, the tax increasing up to 6d. for incomes over £2,200. On incomes derived from property the rate is 6d. for every pound sterling on incomes over £200, increasing up to 1s. for incomes over £2,200. It is expected that $3,000,000 additional revenue will be raised by these new taxes, and the Australian colonies must have money. The effect, however, upon the banks and mortgage companies and mortgagees in possession of land upon foreclosure, will be severe. The Australian banks, it will be remembered, under the recent plans of reorganization promised to pay their English depositors 4½ per cent on the deposits due, but not now collectible. "The tax is the last thing required," says the *Economist*, "to deprive some of the mortgage institutions of hope, for its capitalization will largely reduce the market value of land, already disastrously low." The outlook, therefore, for the financial institutions in Australia is dark, and the pessimistic prophecies of English financial papers seem about to be fulfilled; but the doctrinaires, the labor members, and the socialists seem resolved upon the new taxation as a charge upon wealth.

PLATT'S CHALLENGE.

THERE are two explanations, diametrically opposed to each other, which are given in regard to Platt's impudent manifesto to the people of this city, issued on Saturday. One is, that he feels so sure of his absolute ownership of the Legislature that he thinks he can safely snap his fingers at reformers and all other enemies of boss politics. The other is, that the manifesto is the "bluff" of a boss who fears that his power is weakening, and who hopes to strengthen and maintain it by showing the politicians that he despises his critics. We have little doubt that the second explanation is the true one. If he felt sure of his power, he would not boast of it in public, and would not appeal, as he does, to party prejudice to help him in maintaining it. His desire is to impress Republican politicians, including members of the Legislature, with the belief that Gov. Morton and Mayor Strong are with him, and that he is fighting with them for party supremacy and the offices.

Twice in his manifesto he appeals for harmony to save the party from disaster in 1896. He declares that his opponents "consist, on the one hand, of Mugwumps and Democrats who wish to embroil the Republican party in such fraternal war as will render its success in 1896 impossible, and, on the other hand, of Republican factionists who seek to control the Republican organization and who are willing to break it down if they cannot have their way." Then again, in speaking of his plan for continuing the bi-partisan police system, he says of the Republicans who oppose it: "I want to warn these Republicans that they do not betray their party into the hands of the enemy to be slaughtered in 1896. The scheme to make the Police Board a single-headed commission, in its final fruition, is a scheme to cheat and oppress Republican voters." Now a boss confident of his power would not resort to such weak misrepresentation as this. We are not settling the election of 1896 at present, and nobody knows that better than Platt. There is no election of consequence to be held next November, and a better opportunity could not be desired for ridding the party of a boss than is presented now. Furthermore, if the Police Department be made single-headed, its head will be appointed by Mayor Strong, whose term runs till January, 1898, or more than a year after the election of 1896. How is the Police Department to be used "to cheat and oppress Republican voters" in the next Presidential election under these conditions?

The plea to spare a boss and his corrupt and debasing methods because to attack him will endanger the party in the next Presidential election, is a very old "dodge," which has been raised by every boss in distress for the last ten years or more. It is a plea, moreover, which has been the cause of all our woes as a city. It has been made the excuse for selling out the city to save the country on the tariff or some other national issue over and over again. So long as it is listened to, just so long will hope of municipal reform be deferred. To raise it now, as Platt does, is peculiarly impudent, for the city was rescued from Tammany only by putting in practice the principle that national politics had nothing whatever to do with city affairs. Platt sneers at Mugwumps and Democrats as unworthy of notice in matters of municipal legislation, yet his party owes its present power to those two forces. They, and not Platt, put Mayor Strong in office, and they put him there because he said that he would conduct municipal affairs without reference to national issues and politics in 1896 or any other year. The mayor will keep his promise—on that point we have not a particle of doubt; and in keeping it he will go a long way towards nullifying the efforts of Platt to sell out the city once more on the old basis.

What the Republican party, or the decent portion of it, which Platt treats with such boisterous contempt, ought to see is that it is bound to stand by the mayor in carrying out the pledges which were made in the last campaign. We are at the threshold of the most momentous experiment that has ever been made in this city. If we succeed in showing that the city can be governed without regard to national party issues, simply on business principles, there will be every reason to hope that we shall not lapse again to the old disgraceful methods. But if we fail—that is, yield to Platt—there will be no hope for us again for a quarter of a century. If the Republicans allow themselves to be deluded by the plea for 1896, we may as well abandon all hope of municipal reform during the present generation.

We do not believe that they will be so blind and foolish as to do this, but they must make up their minds to do something more than disagree with Platt; they must come out into the open and fight him. He has challenged them with sufficient insolence and contempt to provoke them to do so. He says as plainly as words can say it that he is the boss, and that he will give this city only such reform measures as he likes. He is hoping to convince the members of the Legislature that he is a greater power than the decent elements of the city population who combined on Mayor Strong and elected him. He is "holding up" in the Legislature all the reform bills now before it. His dummies are holding back the power-of-removal bill, the bill for the reform of the police bench, and the bill for the reform of the department of education, and they will continue to hold them back until they are frightened into advancing them. There should be no delusions entertained on this point. The Legislature, especially the Senate, is doing Platt's bidding on all these measures, and not one of them will be allowed to become law without a fight. The struggle will begin at the mass-meeting next Monday, and we are confident that it will end finally in the overthrow of Platt; for, aside from being the most odious and offensive specimen of his kind we have ever had, he is also the silliest.

"SYMPATHY" IN BROOKLYN.

IT is charged that the Brooklyn trolley companies have largely watered their stock, and are trying to earn 10 per cent. on an unduly large capital; that they work their motormen unduly long hours, and compel them to make dangerously quick time, as measures of economy, thus making the nervous wear and tear very serious; that they have refused to put fenders on their cars, in spite of the fact that they have already killed about 100 people. These grievances are partly public and partly private. The motormen are, however, those immediately affected by them. In a civilized and orderly community they ought to be met by agitation—public meetings, petitions to the mayor and the Legislature, and publication in the newspapers, and appeal to the directors of the roads. If this were the mode in which such disputes between employers and employed were ordinarily settled, sympathy would go out as freely to the men, under such conditions as prevail in Brooklyn, as it goes out to all who are "desolate and oppressed"; and it would certainly be effective.

But every wise man, under all circumstances, keeps his sympathy to himself until he finds out what use is to be made of it. You do not give your sympathy to the most miserable of human beings if you have reason to believe that it will help him to commit burglary; and we may say with confidence that sympathy with railroad employees on strike stimulates rioting, destruction of property, and in many cases murder, and ought to be withheld until order is restored. Thus far, in the history of railroads—steam, horse, and electric—we believe there has been no exception to the rule that a strike leads almost immediately to violence, that it is based on the monstrous doctrine that, once in the service of a corporation or individual, you have a right to stay there as long as you please on your own terms, and to intimidate and, if need be, maim or kill any one who tries to take your place. This has been true of every strike of which we have any knowledge. Consequently, when there is a strike of railroad employees, we all know with all but certainty what is going to happen, and if we contribute to the strike by our sympathy, we are jointly responsible for the results.

We are responsible, too, for the general idea which has permeated the labor mind, that anarchy is the proper remedy for corporate misdemeanors. If men are overworked and underpaid—anarchy; if the cars run too fast—anarchy; if many people are killed through high speed—anarchy;

if the stock has been watered—anarchy. Why anarchy should be the proper remedy for the wrongs of motormen or switchmen is never explained. If a domestic servant, discharged by a brutal master, were to station himself on the stairway with a shot-gun, and threaten the life of anybody who came to take his place, we should witness his arrest as a dangerous ruffian without the smallest pity; but when a body of strikers fill a great city with tumult and disorder and danger to life and property, and take thousands of men away from their business to act as soldiers, we still keep "sympathizing." Our legislators may be too imbecile or corrupt to deal with this matter on its merits, but we cannot allow society to be broken up until the Legislature lays in a stock of wisdom or courage. We must have peace and order, no matter who quarrels with his boss. We cannot be continually burning down our house in order to roast a pig. We cannot allow any company and its employees to settle their disputes at the expense of the whole community. Everybody, from the mayor down, who, when this trouble in Brooklyn began, fell to "sympathizing" and temporizing, is responsible for the week of disgraceful disorder which has followed. He knew, or ought to have known, the course the thing would run unless the companies surrendered.

And why did not the companies give way? The answer to this question brings up another phase of the labor question. They did not surrender because they knew by experience that if they did, the control of their roads would pass from their hands into those of the trades unions. It has consequently become a cardinal maxim of railroad managers never to surrender to a strike, because if they do there is sure to be an end to discipline. The Reading was once foolish enough to do so, and things promptly reached such a pass that the engineers used to stop the trains in mid-route to converse on labor matters. Therefore railroad corporations endeavor to fight it out, as well as murder, arson, and public sympathy with the rioters will let them, in cases where private employers would turn the key in the door and let the strikers stew in their own grease.

The remedies proposed, such as "compulsory arbitration"—that droll phrase which is really a contradiction in terms—ignore the difficulty of getting large bodies of men to abide by the decision of the arbitrators. Indeed, this is so plain that its promoters evidently expect the arbitrators always to decide in favor of the men. In other words, the Board of Arbitration would simply be a means of coercing the corporations. Suppose in Brooklyn the board should decide that the men ought to go back to work, would they go back? Hardly. If they did not, there would be no means of compelling them. Six thousand men could not be punished by fine or imprisonment; and if they were coerced into working on terms they disliked, how would their condition differ from that of slaves? Supposing they refused to continue in the service of the companies on the terms offered them by the arbitrators, would they go off and let other men take their places? Probably not. They would, judging from experience, remain in Brooklyn, cutting wires, tearing up rails, and assaulting anybody who tried to take their places. Their quitting their places without notice might be provided against by holding back part of their wages, and making it liable to forfeiture, but they would leave just the same, and rely on getting their pay back through riot and obstruction of highways.

There are two effective remedies open to us for these troubles of railroad employees. One is the purchase of the railroads by the State or city, and working them on public account through the Platts, McLaughlins, Crokers, and Grants, and all the Mikes, Jakes, and Barneys who carry on our city and State governments. Under these gentlemen there would certainly be no strikes, but there would be plenty of "rotation." The other is the stern, implacable, unfaltering instruction of railroad labor in that first lesson of civilization, that what cannot be cured must be endured; that murder, arson, and rioting are not among the remedies allowed in America to business men who are dissatisfied with the state of their affairs. If clergymen, lecturers, philanthropists, Utopists, and ethical economists do not give up the practice of treating the employees of the great corporations as children who do not understand their own affairs, and who must be humored and cajoled, and apologized for when they get into a passion and kill people and burn houses, the trouble we have had already with this class of persons is nothing to what awaits us in future. A democratic republic like ours can succeed only on the hypothesis that we are all equals, all adults, all masters of our own lives and capable of conducting our own affairs and righting our wrongs through peaceable and orderly methods. A yearly increasing body of voting protégés, secured by coddling against the consequences of their own mistakes, follies, or imprudence, would sooner or later ruin any state based, like ours, on universal suffrage.

POLITICS AS A PROFESSION.

A PROFESSOR at one of the English universities, eminent as a writer upon politics, not long since asked a correspondent in this country a somewhat perplexing question. How is it, he said, that *normally* a professional politician lives when his party is out of power? "It is understood that he makes a trade of politics; but, assuming that he is, on the average, out of office at least half his time, I do not see how he makes it a *remunerative* trade. It always seems to me that the calculations of mere selfishness ought to make a man, if clever enough to succeed as a politician, prefer any other trade to one that, after all, offers such intermittent stipends."

It cannot be denied, we fear, that the legitimate attractions of political life are no longer felt as they formerly were. Abstractly considered, there is certainly no loftier or more honorable ambition than to guide the policy of a great nation, to frame the laws under which the complicated transactions of millions of human beings shall be conducted with order and justice, or even to administer with efficiency the affairs of a small municipality. There was a time when such ambitions were commonly entertained by generous young men in this country, and when the expressed intention to seek a public career drew forth commendation and certainly excited no surprise. Perhaps these conditions still prevail in some parts of our land; but they no longer exist in the great centres of population. The graduate of one of our older universities who should announce that he proposed to take up politics as a profession, would, if he were of high character and promise, fill the hearts of his friends with dismay; while only in case he were of inferior reputation would the general opinion be that he had chosen well.

We need not pause to inquire why this change has taken place; but its consequences are obvious. If those who should by their position and education be best qualified to govern are from any cause excluded, the government will necessarily fall into the hands of men of inferior qualifications. Many such men are undoubtedly honest and well meaning. They constitute our most substantial bulwark against intolerable misgovernment. But they are frequently warped by party spirit, and they are not able to prosecute their work in the light of experience. Her ample page has never been to them unrolled, and while they may prevent corruption, they can do little to promote progress. Such men, moreover, are generally interested in private business of an engrossing character, which prevents their giving much time to political machinations; they seldom continue long in office; and they are greatly outnumbered in our most populous and wealthy States by the "professional politicians."

Many considerations operate to make this class adopt a trade that offers only "intermittent stipends." Foremost among these we incline to place the "gaudium certaminis." In these piping times of peace there is little opportunity to gratify the military instinct, but it would be a mistake to suppose that this instinct has been extirpated. Thousands of men yield to it constantly, striking work at the risk of starvation for themselves and their families just for the pleasure of a contest. The struggles of parties, the rivalry of processions and mass-meetings, the excitement of incessantly recurring elections are a substitute for the pomp and circumstance of war. They appeal to the class from which armies are recruited, and they ap-

peal to the motives which animate recruits. As Adam Smith pointed out, every one overvalues his prospect of success, and the raw recruit or the incipient politician attains at a stride, in his imagination, glory and rank and power.

Nor does this complete the analogy. Did the condottieri of the Middle Ages find it difficult to obtain troopers because campaigns were intermittent? Every soldier of fortune expected occasional reverses, and was used to alternations of poverty and plenty. When his pockets were full,he shared their contents with less fortunate comrades, and when misfortune befell him, he expected assistance in his turn. So with our politicians. They are generally—to do them justice—of the "hail-fellow" type, going the rounds with "the boys," affable and on good terms with every one. They are lavish with their money, which comes either from their leaders or from the spoils of office, and which they look upon much as soldiers regard their pay and their plunder. As is the case with soldiers when not actually fighting, the attractions of a common profession are greater than the repulsions of conflicting causes, and it is needless to remind our readers of the significance of "non-partisan" commissions. Our professional politicians fully understand the wisdom of making friends of the mammon of unrighteousness, and when they fall, they are not altogether cast down. Some of the leaders are sure to retain office or to have laid hold of some good thing, whereby they are enabled to take care of their followers until the return of popular favor. They are greatly assisted in this by our peculiar form of government; for if a politician lose office by the defeat of his party in a national election, he may be compensated through its victory in his State or municipality. More than one Congressman, repudiated by his own constituency, has restored his fortunes by taking up his residence in the city of New York.

Moreover, the pursuit of politics does not necessarily require the abandonment of other occupations. As we have said, the politician need have no education or social position. He may be the proprietor of a liquor-saloon and at the same time a member of the Legislature. He may keep a gambling-house and be a police-justice, or be a receiver of stolen goods as well as an alderman. His private occupation may suffer from his devotion to the public service, but such injuries are not irretrievable, and if he loses office, he can make some shift for himself. Probably he will not prosper so well in the long run as if he had devoted himself with sobriety and industry to some useful trade; but such devotion is not to his taste. *Falstaff* was a man of excellent parts, but he had no fancy for making a living by honest labor. Had he lived in our day and country, he would have infallibly taken to politics and have had great success therein.

To this must be added that the stipends of the politician, although intermittent, average well. From the floor-scrubbers and scavengers up to the police justices, if not higher, the pay is easily double what the work is worth. This constitutes a steady temptation to those who are not likely to succeed in the competition of private life, where sobriety and industry are the prime qualifications. This temptation is felt even by those who have the ability to attain distinction. Choate speaks of Webster as, shortly after his admission to the bar, "resisting the sharp temptation of a clerkship at fifteen hundred dollars a year," and it admits of no doubt that many young men seek political office because an assured support, even for a brief period, is, or seems, a matter of life and death for them. They may presently lose their offices, but in the meantime they have the salaries, and something may turn up which will give them a chance to retire. Doubtless not a few young men waste their talents in this way, and find that, having started in politics, they have lost their chance of success elsewhere. But, considering all the ups and downs of life, it is doubtful if men of the stamp of our professional politicians could do better for themselves than get support, even if intermittent, at the public expense. They would not, without changing their natures, make very desirable employees in private business, nor would they be likely to succeed in business by themselves. In fact, political positions, as government is now carried on, seem to be just the places for them, and it is hard to tell what would become of them if governments were to be reformed. Still, nations do not continue at war because their disbanded soldiers have to look out for themselves when peace is declared; and if we can reform our governments, we need not worry over the fate of the professional politicians.

THE SOUTH AND THE BLACK MAN.

Of the four new chapters added by Mr. Bryce to the third edition of his 'American Commonwealth,' none will attract more attention than those on the South since the War, and the Present and Future of the Negro. They form virtually one chapter, in which, as usual, the author skilfully combines history with exposition and forecast. Mr. Bryce's account of Reconstruction is neat and all but adequate; and if he does not directly answer the question whether the bestowal of suffrage on the freedmen was a political mistake, he leaves it to be inferred that he agrees with the eminent Southern witnesses whom he adduces, in regarding the possession of the suffrage as indispensable to the protection and independence of the blacks. This opinion, we believe, will stand. At the close of the war the Southern whites were incapable of choosing for themselves between three possible conditions for their late slaves, viz., as a portion of the community purposely "left defenceless and neglected, unimproved and unimproving," or as brought under the equal protection of the laws but disfranchised, or finally as full-fledged citizens sharing in the common government. The first condition would have been little better than slavery, while the experience of thirty years has demonstrated that equality before the law without suffrage would have been a chimera, seeing that it does not exist to-day even with the suffrage.

In a purely incidental way, Mr. Bryce brings against the system of slavery one of the most terrible indictments ever framed. The freedmen were, he says, "scarcely more fit to fend for themselves and guide their course as free citizens than when they, or their fathers, had been landed from the slave ship." In other words, slavery was in no sense a discipline in civilization, nor ever looked to any change in the brutish condition of the bondman. It could not brook any attempt to foster his intelligence, because discontent with his lot was sure to attend his enlightenment and make him at heart either a fugitive or an insurgent. What Mr. Bryce does not remark (and this is why we think his picture of Reconstruction inadequate), is the inherited dread of the elevation of the blacks which kept the whites from either undertaking it themselves or welcoming missionary assistance from the North. This dread is to-day the core of the so-called Negro Problem. It is shown not only in separate schools for the two colors, but in the steady social ostracism of white teachers of the blacks, particularly if Northerners. It is shown above all in the statutes making intermarriage a penal offence.

On the latter subject Mr. Bryce throws the weight of his humane authority into the white scale. Not in words. He expresses a wish "that lynching should be sternly repressed," and "that the State statutes or local regulations enforcing separation of blacks from whites in travelling or in places of public resort should be repealed." But he pointedly omits to recommend abolition of the laws forbidding intermarriage. The reason of this is, that he is convinced that the negro "will stay socially distinct, as an alien element, unabsorbed and unabsorbable"; and herein he finds the peculiar menace of the problem he is discussing. His prediction would, of course, be endangered by the removal of artificial barriers to "absorbability," such as Massachusetts, by the way, maintained on her statute-books into the forties. Bleaching went on under slavery at a rate and with an openness which proved that nature offered no invincible barrier to the union and mixture of the dominant and the subject race. It was no obstacle to the election of a Vice-President of the United States by a pro-slavery Senate that he had given two of his mulatto daughters in marriage to white men—the second in 1832, at which

time the moral feelings of the people of Scott County, Ky., were reported shocked and outraged by so indecent an example for their sons. There was nothing shocking in the having mulatto daughters, much less in deeding to them not only land but slaves. Had he sold them—that is, had he doomed them as slaves to utter unchastity—there would have been no ruffled feelings in Scott County. It was the natural affection of a parent which appeared so lamentable.

It might be conceded that the laws against intermarriage add but little to the repulsion between the two races brought about by emancipation, though on this point evidence is not easy to obtain. That white lust still satisfies itself where virtue is easiest—and want of chastity is one of the charges justly laid at the door of the black woman of the South—we, for our part, cannot doubt. That the denial of genuine marriage among the lower orders is a premium on illicit intercourse universally we can as little doubt. But the weight of the statutory prohibition lies in its perpetuating the doctrine of slavery, that the colored man is, when all is said and done, less than a human being. This doctrine has not been eradicated from the white mind in the generation since the war, and it coexists with a logical toleration not only of exceptional punishments for crimes perpetrated by the blacks, but for atrocious cruelty reserved solely for them—the lynchings deplored by Mr. Bryce, in which the faggot is ever ready to be applied to the dark skin.

If the South were fully conscious of itself, it would inquire on what theory of human government and society it can be indifferent, let alone being hostile, to the elevation of that vast population which, in Mr. Bryce's words, remained, up to the eve of emancipation, "in their notions and habits much what their ancestors were in the forests of the Niger or the Congo," their masters being "three or four thousand years in advance of them in mental capacity and moral force." A like condemnation is now being visited on foreign immigrants in comparison with native Americans; and how absurd it would be, if this element could not be excluded from the country—as the black Americans cannot be extruded from it—to wish to cut them off from our schools and to keep them in the condition of pariahs. Such action would be as sagacious as to remove them from the control of the health board because their numbers would be kept down by excessive mortality—as if there were no contagion for the rest of the community. The efforts to prevent "absorption" at the South have in them the seeds of moral contagion.

The Negro Problem in the mass may be one for publicists and philosophers; in the individual it is one of Christian dealing with a fellow-man. In this way votes may be won more surely than by juggling with ballot-boxes and poll-lists, as crime may be diminished without those bloody instructions which return to plague the inventor. A philanthropic spirit must arise in the South to coöperate thankfully with that which has for seventy years been extended to it from the North. In Mr. Bryce's words, "the real change to which the friends of the South and of the negro look forward is a change in the feelings of the white people, and especially of the ruder and less educated part of them." We will add that this change will also have a beneficial effect at the North, where the strength and endurance of color prejudice (apart from intermarriage) is, in view of Republican professions and the clamor of Labor, fairly to be called disheartening.

A MINISTER *MALGRÉ LUI.*

NEW YORK, January 26, 1895.

BEFORE me are five unpublished documents, just found in Paris, which possess historical interest in connection with the strife between the United States and France near the close of the last century. They are, in chronological order, (1) an unsigned proposal, dated September 13, 1793, for a closer alliance between the two republics; (2) some "Observations" submitted by Thomas Paine to the French Government (1795); (3) a letter of Paine to the French Minister of Foreign Affairs (1797); (4) a letter of Paine to Talleyrand (1797); (5) a letter of Talleyrand to Paine (1797).

On the earlier two of these I will touch briefly. The first, though professedly a French proposal, was evidently concocted among the Americans in Paris, who had come to regard Paine as their minister, and thus brought on him the wrath of the regular minister (Morris). Besides political adventurers from America, there were in Paris, in 1793, ninety captains whose vessels lay at Bordeaux, forbidden to reload and go to sea, lest their cargoes should be captured by the British. Having vainly pleaded with Minister Morris to interfere in their behalf, the captains appealed to Paine, who introduced them to the Convention, which made them concessions. This was near the close of August, 1793. Immediately after that, Paine's clients apparently felt that he was in danger. They tell the French Government, under their French *alias*, that Americans are prepared to supply them with grain, and corsairs for their war with England, and suggest the sending of two commissioners to treat with Congress. The proposal made by Washington and Jefferson to Otto (as cited in my recent paper in the *Nation*), "reciprocal naturalization of the citizens of the two countries," free commerce between them, guarantee of Canada and Louisiana to the Americans if they desire them, and cancelling of all debts of America to France, are proposed. They suggest that "Payne," though he has too many enemies to be one of the commissioners to the United States, shall accompany them and set forth their aims in the press.

(This document probably hastened the imprisonment of Paine, which his friends wished to avert by getting him out of the country. It was no doubt in Paine's mind when he wrote to Monroe that Morris and the Committee of Public Safety were both interested in his imprisonment. "The former wished to prevent my return to America, that I should not expose his misconduct; and the latter, lest I should publish to the world the history of its wickedness.")

The second of my new documents ("Observations") was written after the negotiations of Jay were ended, but before the treaty was published, either in America, England, or France. Paine, knowing that the real purpose of Washington in the negotiation was to get England out of our frontier posts, proposes that France shall strengthen her friends in America by announcing that she will exact, as a condition of peace with England, the evacuation of those posts, and also that a condition of her peace with Spain shall be free navigation of the Mississippi. This paper was written in the house of the American minister (Monroe), and no doubt in consultation with him.

The anger of France at the ratification of the British treaty was somewhat subsiding under the influence of Monroe when he was recalled. This recall awakened extreme resentment in France, and the retiring minister was notified that the Directory would not recognize any successor. In Monroe's pamphlet, after his return to America, he said that a minister to France "should possess the confidence of this [French] government," and on this Washington commented: "If he does not mean himself here, it is not difficult to guess who the other character is marked out by this description." This "other character" was probably Paine; and in fact this ex-prisoner became, after Monroe's recall, the only American minister recognized in France for the rest of the century. There is ample evidence of his being consulted by the Directory, by ministers of foreign relations, and by Napoleon. Nor was Paine's compulsory ministry without formidable responsibility. This was especially the case on the approach of C. C. Pinckney, as successor to Monroe. Not only did the Directory resolve not to receive him, but in the strained relations between the two countries, there was danger even of personal insult, if not indeed violence, to Pinckney, which might involve the two countries in war. Under these circumstances Paine made an effort to save time for farther negotiations with America, and addressed the following note to the Minister of Foreign Relations, De la Croix, (father of the artist Delacroix). I have not the original, but its translation into French by "Derché," and this, my third new document, I give entire:

"I understand that Mr. Pinckney has reached Bordeaux, and is on his way to Paris.

"The Federal Constitution of America declares that the President shall nominate ambassadors with consent of the Senate. President Washington has nominated Mr. Pinckney during the recess of the Senate, consequently without having obtained the consent of the Senate; but he is persuaded that it will confirm the nomination when it shall assemble. The nomination is, then, not complete until the Senate confirms it. Such being the case, the French Government will itself judge whether Mr. Pinckney can be received in his character of Minister until his nomination be fully confirmed; for it is not impossible that the Senate may refuse the confirmation, and it is certain the nomination will encounter opposition in the Senate.

"Another dubious thing in the nomination is, that it was made by Mr. Washington at the moment of his retirement from the Presidency, and that he may perhaps be no longer in office when Mr. Pinckney's letters of credence are delivered. This circumstance, in connection with a nomination that has not received the Senate's approbation, throws doubt on Mr. Pinckney's letters of credence, and renders them problematic; and the French Government will judge if it can receive Mr. Pinckney otherwise than as an individual awaiting from his Government his powers to deploy the character of Minister.

"This, I incline to think, is the best way of treating this affair, because it will render Mr. Washington's crafty policy ridiculous and derisive, without

the least affront to the American People or to Congress. If there were need to nominate a Minister in the place of Mr. Monroe (which is not certainly the case), Mr. Washington should have left this task to the President who shall succeed him; but he has astutely profited by the few days remaining to him to put an affront on the French Government, and especially on Mr. Monroe. Mr. Washington cannot but know that Mr. Jefferson, should he be chosen President, would not displace Mr. Monroe. Mr. Washington has adroitly profited by his opportunity to make the appointment himself, during the closing days of his Presidency. The state of suspension in which I consider Mr. Pinckney is not of such a nature as to prevent consultations (*pourparlers*) between the French Minister and Mr Pinckney. They could discuss all sorts of subjects, and perhaps with the more freedom because their interviews would not be directly official.

"So long as Mr Pinckney's nomination shall be in suspense in America, until it receives the Senate's confirmation, so long should it remain in suspense in France."

This note is without date, but an endorsement shows it was sent to Citizen Caille, "to verify whether Mr. Pinckney's nomination is unconstitutional, and promptly return me this Note." An entry shows that the Directory decided that it would not be "dignified" to receive Pinckney in the way proposed by Paine, and the new minister was promptly expelled from French territory. Unless Paine's constitutional point was merely meant to cause delay and prevent the angry action which occurred, he was as hazy as Washington himself was about his right to make the appointment. It is also notable that in his message of December 7, 1796, Washington does not mention the change of ministers in France, Congress being informed of it January 19, but little over six weeks before the inauguration of Adams.

The last of my new documents are letters exchanged between Paine and Talleyrand, who became Minister of Foreign Relations in the summer of 1797. It will be borne in mind that the Directory had taken up the position that, during its war with England, it would deal with American ships and cargoes precisely as America *permitted* England to deal with the same. If England was permitted to capture American ships, provisions, and seamen to be used against France, France would capture and utilize them against England. The treaty of 1778, which forbade France such captures, had been rendered injurious to her by the British treaty, which allowed United States provisions to be seized at sea, on their way to France, on stipulation of compensation. Paine did not comprehend that, under this stipulation, the seizure of American provisions at sea by England was regarded with equanimity by American shippers. On September 30, 1797, he wrote (in English) to Talleyrand:

"Citizen Minister: I promised you some observations on the state of things between France and America. I divide the case into two parts; first, with respect to some method that shall effectually put an end to *all* interruptions of the American Commerce; secondly, with respect to the captures that have been made on that Commerce.

"As to the first case (the interruption of the American Commerce by France), it has its foundation in the British Treaty, and it is the continuance of that Treaty that renders the remedy difficult. Besides, the American administration has blundered so much in the business of treaty-making that it is probable it will blunder again in making another with France. There is, however, one method left, and there is but one, that I can see, that will be effectual It is a *non-importation Convention,—That America agrees not to import from any Nation in Europe who shall interrupt her Commerce or seize any goods, wares, or merchandise whatever, and that all her ports shall be shut against the Nation that gives the offence.*

"But it would be far better if this non-importation convention were to be a general Convention of Nations acting as a Whole. It would give a better protection to Neutral Commerce than the armed neutrality could do. I would rather be a Neutral Nation under the protection of such a Convention, which costs nothing to make it, than be under the protection of a navy equal to that of Britain. France should be the patron of such a Convention and sign it It would be giving both her consent and her protection to the Rights of Neutral Nations. If England refuse to sign it she will nevertheless be obliged to respect it, or lose all her Commerce. I enclose you a plan I drew up about four months ago, when there was an expectation that Mr. Madison would come to France. It has lain by me ever since.

"The second part, that of settlement for the Captures, I will make the subject of a future correspondence. *Salut et respect.*"

The enclosure is a "Maritime Compact," of nine articles, by which the nations agree to close their ports against the ships and commerce of every country that interrupts neutral commerce, and unite to punish the offending country. The flag of this international association is to be the imitation of a Rainbow.

Talleyrand's answer (in French) is dated October 6:

"I have the honor to return you, Citizen, with very sincere thanks, your Letter to General Washington, which you have had the goodness to show me.

"I have received the letter you have taken the trouble to write me, the 9th of this month [Vendémiaire]. I need not assure you of the appreciation with which I shall receive the further suggestions you promise on the means of terminating in a durable manner the differences which naturally excite your interest as a patriot and as a Republican. Animated by such a principle, your ideas cannot fail to cast valuable light on the discussion which has been raised, and which should have for its end a reunion of the two Republics, in whose alienation the enemies of Liberty triumph."

Paine's "Maritime Compact," translated by Bonneville, was distributed among all the ministers of Europe (1800), and embodied in one of the author's "Letters to the American People" (1803). The original manuscript of this American letter is in the possession of Mr. W. F. Havemeyer.

Moncure D. Conway.

THE ROYAL ACADEMY'S OLD MASTERS.

London, January 5, 1895.

The Royal Academy has never made such rich amends for its summer show as in this year's winter exhibition. The twenty-sixth collection of Old Masters brought together in Burlington House proves one of the finest hung for many winters—so fine, indeed, that the Venetian pictures at the New Gallery suffer sadly by comparison. Moreover, the Academy has made what, for it, must be counted quite a new departure. The exhibition before now has often included masterpieces, though perhaps these have never been as many, nor selected with as much discrimination and intelligence. But the Academy has so seldom, throughout the century of its career, offered anything in the shape of novelty, that it is the new departure which first claims attention. It is of genuine importance because of the influence revealed and the promise given.

The new feature, then, is the "collection illustrating the sculptor-goldsmith's art, chiefly of the fifteenth and sixteenth centuries." The custom at the winter show has long been to fill the water-color rooms with a special series, complete in itself, representing the work of a single artist whom it was thought well—for one reason or another—to honor. Thus, last year Stothard was chosen for the purpose, and the year before, Alfred Stevens. It was late in the day to pay this tribute to Stevens, who was never recognized by the Academy during his life. The choice pointed to the influence of sculptors, like Mr. Gilbert and Mr. Onslow Ford, who are in close sympathy with Stevens, and, like him, have at times devoted themselves to those minor branches of sculpture here classified as the sculptor-goldsmith's art; but more particularly Mr. Gilbert. Since then, Mr. Frampton, who may also, for the sake of definition, be called decorator as well as sculptor, has been elected an Associate, and the influence has been strengthened. Certainly in no other way is it easy to explain how the Academy has come to depart so far from its traditions as to exhibit work suggestive rather of the Arts and Crafts Society, or an exhibition of decorative art. There are cases filled with examples of the jewelry designed by Italians and Spaniards, Flemings and Germans, in days when every jeweller was an artist, not a manufacturer; and most notable, in this section, is Sir J. C. Robinson's collection of rings, which includes very beautiful intaglios, cameos, and scarabs. There are old chalices and cups of gold, exquisite silver repoussé work, bronze medallions and plaques, ivories, snuff-boxes, *bonbonnières*, and, in a word, all the dainty odds and ends designed by the artist craftsmen for people who delighted in such extravagant trifles. To add to the interest, many original designs for this work have been hung in the same room, among them one or two uncommonly good pen-drawings by Dürer, and elaborate sketches by Holbein.

Now, one of the grave charges against the Academy is its indifference to all art save the painter's and the sculptor's. The treatment it accords to water-color and black-and-white is little less than a scandal. But the decorative artist (the term has been made useful by custom despite the contradiction it implies) has again and again maintained his grievance to be still more scandalous. He is not even accorded the little obscure corner granted to illustrator and etcher in the summer exhibition, nor has he ever been represented in the list of Associates and Academicians, though at least one steel (or reproductive) engraver has hitherto been supposed to satisfy the claims of all black-and-white men. Therefore, the Academy's first recognition of the applied arts seems to hold out promise of a broader and more enlightened policy for the future. The chances are it will lead to nothing; and, when all is said, the applied arts now acknowledged officially are limited to the few that appeal more directly to the sculptor. But if the Academy continues to extend its patronage to gold and silversmith and gem-engraver, can it, in reason, deny the rightful demands of the designer of wall-paper and tapestry, of stained glass and pottery? This is the question involved, and it is really of far more immediate importance than the actual objects shown. One's faith in academies, literary or artistic, may not be very great; but still, so long as there is an Academy of Arts in England, it would be as well for artists if it were to become something more than a close corporation for a small group of painters and a few sculptors and architects.

It must be confessed that, but for the question at issue, the sculptor-goldsmith's creations prove less delightful than the paintings. As usual, the Old Masters are Dutch and Flemish, Italian and Spanish, French and German, while the "deceased masters of the Bri-

tish school," as the Catalogue always calls them, bring the collection, in point of time, down almost to our own generation. But in general arrangement and scope accustomed rules are observed more than accustomed judgment has been shown, not only in selecting, but in leaving out. The result is, that walls do not offend by the rubbish that is the chief drawback to all collections of Old Masters —is just now, as I have pointed out, to the New Gallery's show of Venetian art. This s most apparent in the British pictures. We have been spared the regulation Landseer and the irritating assortment of Mulready's and Maclises and the like. There is hardly a canvas which is not really good in itself and characteristic of its painter. Thus, among the many Sir Joshuas are the Crewe portraits, lent by Lord Houghton, several bearing melancholy witness to the bad colors that prevailed on the artist's palette, and one or two of children suggesting how the way was prepared for the sentimental "Bubbles" and "Cherry Ripes" of to-day. The Gainsboroughs give several very lovely examples of his masterly use of blue, in defiance of all Sir Joshua's protest against that "cold color"; the "Miss Willoughby" and "Lady Eardley" being the most distinguished. And the Romneys present all the enchanting variations of Lady Hamilton's enchanting face which his name in a catalogue leads one to expect. Even the Raeburns and Lawrences are exceptionally good; and a far earlier master, but too little known, William Dobson, the pupil of Vandyck, can be studied in a portrait of a young man in armor which has much of the dignity and serenity of a fine Rembrandt.

The landscapes are not less famous. There has been hung, for instance, "The Cottage Door" of Gainsborough, the property of the Duke of Westminster, one of the most talked-about of all the landscapes which during his lifetime littered up his hall and studio, waiting for the purchasers who rarely came, even in the years when he could scarce paint portraits fast enough to meet his commissions. Constable's "Dedham Vale" and "Scene on the River Stour" are both here; and three or four excellent Turners, none more masterly than the Mortlake, showing one of the great curves the Thames makes between its low banks, and giving marvellous effects of light and atmosphere, not always to be had in this painter's more eccentric impressions.

To pass on to the foreign schools is to wonder anew at the wealth of England's royal and private galleries. More than one canvas may be of doubtful authenticity; this is inevitable so long as old pictures are prized for their age rather than their merit. Here the name of Titian may be dishonored by a portrait that the most casual observer, one would think, must swear he never painted; here Terburg may fare no better; and both can claim Velasquez as a fellow-sufferer. But there is good work enough to atone amply for all the insults offered. A really good Velasquez is included, a replica of that little Don Carlos in hunting costume, with dogs at his feet, which is one of the glories of the Prado; by comparison even Sir Joshua's children seeming but so much idle paint. A very stately portrait of Ariosto is far from bringing discredit upon poor Titian, who, at the New Gallery, is held responsible for so many an indifferent painter's indiscretions. The Primitives are kept within reasonable bounds, so that an occasional Mabuse, or follower of Holbein, is not lost in an appalling succession of "cock-eyed Madonnas." There are Janets to make one pause. And a fair array is offered of Cuyps and Jan Steens and Gabriel Metsus, with one good Terburg and a little Franz Hals to force a contrast.

But here interest centres about the Rembrandts. Not many national galleries, outside of Holland, can boast of so strong a collection—small as it is—as this one, loaned for the occasion by the Duke of Westminster from his own private gallery. Portraits of Nicholas Bergheim and his wife, and of Rembrandt himself, as a youth decked out in the studio properties he loved, have their no light value; a landscape (with figures, according to the Catalogue, put in by Teniers) is not without importance, since the landscapes he painted are known so much less well than those he etched; but the wonder of these canvases fades before the "Gentleman with a Hawk," and the "Lady with a Fan," in whom one cannot but recognize the Saskia of so many pictures. In both portraits all Rembrandt's finest qualities are disclosed: his vigorous drawing in the figures, his subtle modelling in the faces, his dignity of composition in the absolutely simple pose, and the rare charm of color, the rich, warm glow with which he filled his finest pictures, and which not even Titian has surpassed. These two portraits alone would suffice to make the show noteworthy. N. N.

PARIS OF THE REVOLUTION.

PARIS, January 17, 1895.

M. G. LENOTRE seems peculiarly drawn towards the most painful details and incidents of the Terror of 1793. He had already published a book on 'The Guillotine and the Executors of Criminal Judgments in Paris and in the Departments, during the Revolution, from Documents in the State Archives'—a curious and interesting volume, but of a decidedly painful and almost abhorrent nature. He gives us now another volume, which is more readable, 'Paris Révolutionnaire.' There is a very large *Literatur* on Paris, to use a German expression. Some collectors feel a sort of passion for all that concerns Paris, its monuments, its streets, its development. The engraved pictures and plans of old Paris always fetch a good price at the public sales. All amateurs of engraving know how dearly they must pay for the etchings of Méryon, who bequeathed a sort of religion for the *Cité*, the Seine, its bridges, its quays, their many-storied and narrow houses, its boats. Drumont, who has become so famous as the writer of 'France Juive' and editor of the *Libre Parole*, wrote, when he was young and unknown and had not won popularity, a very agreeable and sometimes almost poetical book on 'Vieux Paris.'

I could not help being drawn towards 'Paris Révolutionnaire,' as I must confess having myself an old affection for the "Grande Ville," and especially for the oldest parts of it, in which every stone has its history. M. Lenotre was led to write this new work by M. Sardou, who knows Paris better than anybody, and who is a passionate collector of whatever concerns its history. It might almost be said that Sardou writes his dramas for the pleasure of reconstituting some part of the past. "Thermidor" has for its background the Paris of the Revolution; and "Madame Sans-Gêne," the Paris of the Empire.

"Chronology," writes M. Lenotre, "and geography are the two eyes of history; if this be so, the history of our Revolution is one-eyed, for its topography remains to be made. Not only the merely curious are all but ignorant where were the Jacobins, the Feuillants, the Force, the Manége, the Revolutionary tribunal; but even the erudite (and I do not except those who have made a special study of the Revolution) could not tell us exactly what were in 1793 the Tuileries, the Abbaye, the Conciergerie, the Hôtel de Ville. . . . How often, in reading the pages of Michelet and Lamartine, inspired by the dark days of the Terror, have I tried mentally to reconstruct the room in which the Convention sat, the prisons, the Committees."

M. Lenotre begins with Robespierre: "À tout seigneur, tout honneur." We see first the dark and narrow street of Arras which Robespierre left to take the diligence that was to bring him to Paris, after he had been elected a member of the States-General. He borrowed ten louis to make the journey, and had nothing but a trunk. (M. Lenotre gives us a list of the clothes which were in it, but does not tell where he procured it.) This Deputy of the Tiers had a coat of black cloth, and he bought another, of black embossed velvet, at the Temple in Paris. As a Deputy he received eighteen livres a day; he kept a third for himself, sent a third to his sister Charlotte at Arras, and the remaining third to a person who idolized him, if we may believe Pierre Villiers, who afterwards became his secretary and who wrote the 'Souvenirs d'un Déporté.' Robespierre long remained obscure; he began to be known only after he had left the little hôtel in the Rue de Saintonge, and taken rooms in the house of a man called Duplay, who offered him his hospitality. Duplay was an upholsterer who lived in the Rue St.-Honoré; he had known Robespierre at the club of the Jacobins; he admired him, he was proud to have a Deputy in his house and to receive his friends there. Duplay's house still exists, but several stories were added to it in 1816, without, however, altering the principal dispositions of the apartments of Duplay and of Robespierre.

Robespierre lived there for three years, with Duplay, his wife and his family, which consisted of four girls and a boy. Éléonore, one of the girls, entertained for Robespierre a sentiment in which admiration was perhaps mingled with love. Some said, when he died, that she was engaged to him; others, that she had been his mistress. Her young friends, at Regnault's atelier, where she took lessons in drawing, called her, in derision, Madame Robespierre. Her dream was not of long duration. Elizabeth, a sister of Éléonore, was married to Philippe Lebas, a Terrorist Deputy, aged twenty-eight, on the 26th of August, 1793. The room in which the sisters slept is the least altered of all. The doors, the Louis-XVI. mirrors, the panels, even the floor, remain intact. We can imagine, with M. Lenotre, the conversations which took place in the drawing-room of the admiring Duplays, between Robespierre, Camille Desmoulins, Saint-Just, Lebas, Collot-d'Herbois. We can see, on the morning of the famous festival of the Supreme Being, Mme. Duplay preparing the neat clothes of the Dictator—his blue coat, his nankin breeches, the tricolor silk sash, the little hat with the tricolor cockade.

What became of the Duplays after the execution of Robespierre? Mme. Duplay disappeared; she either was murdered, or committed suicide in the prison of Sainte-Pélagie. Lebas's widow changed her name, and for a while worked as a washwoman in the boats of the Seine. Lamartine saw her in her old age, and has described her in his 'Histoire des Girondins.' Éléonore survived the Revolution forty years, living in great seclusion; she considered herself a widow, and wore mourning all her life. Curiously enough, she received a pension from the Thermidorians; this pension,

which was 6,000 francs at first, and was afterwards reduced to 1,500, was paid by all the successive governments till 1834. Duplay himself was compromised in the conspiracy of Babeuf, but he was released and remained quiet till his death, which took place in 1820.

M. Lenotre has had the curiosity to look for the Hôtel de la Providence, the little inn where Charlotte Corday took a room when she arrived from Caen with the intention of killing the monster Marat. This house is still in existence, in one of the dingiest streets in the neighborhood of the Place des Victoires. It is no longer an inn, but the adjoining house has become one under the name of Hôtel de Francfort. The legend has followed the business, and there is now in this Hôtel de Francfort a room which is shown as one occupied by Charlotte Corday. Charlotte left the Caen diligence at twelve o'clock and hired a porter who brought her trunk to the Hôtel de la Providence. She was tired from her long journey and remained in her room; the next day she tried in vain to see Marat at the Convention. She knew nothing of his habits, but she soon found out that her only chance to see him was to go to his house. The next day she bought a common kitchen knife, took a cab, and had herself conducted to the house where Marat lived—a sort of bourgeois hôtel, with a portecochère, a little inner court, an open staircase. The plan given by M. Lenotre shows very clearly the disposition of Marat's apartment. He lived there with his mistress, Simonne Evrard, her sister Catherine Evrard, and his own sister, Albertine Marat. Marat, as is well known, received Charlotte Corday in his bath. While they were talking, Simonne entered a moment, with a potion which she was preparing for him. She took two dishes, in which was prepared the meat for the evening repast, and left the room. She was hardly out when she heard a great scream; she reëntered—everything was already covered with blood. Charlotte, very pale, was standing; she had placed her knife on some newspapers.

M. Lenotre does not exactly know what to say about Charlotte Corday; he cannot understand how a well-born young woman, educated in religious ideas, could execute her crime so coldly, without hesitation. He finds her almost too sublime. To a question of Fouquier de Tinville's she answered: "Oh, the monster! he takes me for an assassin." When he asked her, "Who could have inspired in you so much hatred?" she replied: "I had no need of the hatred of others. I had enough of my own." She was serene in her prison and serene on the scaffold. She was a descendant of the heroic Corneille. The only authentic portrait of her is that made during the trial by Hauer, which is now in the museum of Versailles. Her hair was blonde, her eyes blue, her skin very white. She is represented in this portrait with a white cap, and a white fichu folded on her breast; a lock of hair falls on one side over her shoulder. The features of the face are very noble and striking. A friend of mine has a portrait of her unfinished, made by our great Baudry; from what sources? I could not tell. It is difficult to imagine anything more striking. It is certainly singular that France, in her great trials, should find women representatives of her deepest and most legitimate instincts. Jeanne d'Arc is the poetical figure which will always represent the uprising of popular France against invasion, against foreign domination. Charlotte Corday will always represent the reaction of innocence and virtue against the cruel tyrants who sent every day virtuous and innocent victims to the guillotine.

There is a great variety of horrors in this volume of 'Paris Révolutionnaire.' A chapter is given to the Abbaye, where took place the massacre of the prisoners on the 2d of September, 1792. The prison, which was a part of the ancient abbey of Saint-Germain des Prés, was on that day full of soldiers who had escaped from the massacre of the Tuileries on the 10th of August, of relations of émigrés, journalists, priests, aristocrats of all ranks. One of the priests who were in the Abbaye, the Abbé de Salamon, who escaped miraculously, has left an account of what he saw on that day; his manuscript has only recently been found in Rome. He was an internuncio of the Pope; he had previously been a counsellor of the Parlement of Paris. M. Lenotre enters into minute details as to the places where the massacres occurred in the courts of the Abbaye, and he shows conclusively that the number of the victims was 270. Maillard, who, during that bloody night of September, constituted himself a judge and went through the mockery of justice, was a young man twenty-nine years old; he had played his part on all the great days of the Revolution; he became the leader of the mob at the Abbaye, and for three days multiplied his functions, judged the prisoners, ordered the summary execution of all the priests, presently (at the Carmelite prison) examined more prisoners, had many executed, and saved a few—which allowed him afterwards, in a pamphlet which he wrote for his defence, to say: "I am not a man of blood." He was familiarly called *Tape dur*. We find him in 1793 in the police, at the head of sixty men who were hunting the suspects, keeping for himself all their assignats, imprisoned for his robberies at the Force, released, and finally dying of consumption on the 15th of April, 1794, at the age of thirty-one.

The salon of Mme. Roland has furnished a chapter to M. Lenotre. He shows us first the house where she was born on the Quai de l'Horloge, afterwards the Hôtel de Calonne et de Lionne, which was the Ministry of the Interior in 1792, when Roland was minister; the great drawing-room of the ministry, reconstituted with its admirable panels, after inedited drawings in the Cabinet des Estampes. These numerous engravings give great value and charm to the exact and minute studies of M. Lenotre; and all lovers of old Paris, all who are interested in our Revolutionary period, will find something to enjoy or to learn in a book which takes us from the old Tuileries to Danton's home in Arcis and in Paris, from the Club of the Jacobins to the Club of the Cordeliers, and which brings us in the end to the prison of Marie Antoinette and the Conciergerie. *Sunt lacrymæ rerum*, said the Latin poet; these stones of the Conciergerie have their terrible eloquence, and so have all the houses and dwellings with which M. Lenotre has made himself and makes us familiar.

Correspondence.

THE A. P. A. IN MONTANA.

To the Editor of The Nation:

Sir: Every sober citizen, loyal to the fundamental principles of American institutions, will find food for reflection in the following incident:

The Republicans of the Montana Legislature, having nominated in caucus Mr. Thomas H. Carter for one of the United States Senators to be elected at this session, the American Protective Association of Montana sent a lengthy protest to be read in the House of Representatives, warning all members against voting for a Romanist of any character, reciting as a threat some recent State history to show the strength of the A. P. A., and rehearsing some evidences of Papal ascendancy in this country. Among other things, it claimed a vote of over 8,000 in Montana out of a total vote of about 50,000.

But note the reception given to this surprising communication. Scarcely had the clerk read aloud the title of the document and its opening sentence, when a member jumped to his feet and vehemently moved that it be laid on the table. A dozen men rose to second the motion, which passed unanimously. Not content with this, a member then moved that it be sent back immediately as having been unread. This, too, received a dozen seconds and went through without a dissenting vote.

The Butte contingent of the A. P. A. seems to have been fired with indignation at this summary disposal of their solemn warning. A train was chartered, and at an early hour on Tuesday morning—the day set for a formal vote in both houses for United States Senators—a deputation of 100 members of the A. P. A. arrived in Helena. They immediately proceeded to "interview" with considerable emphasis certain refractory legislators, but were dumfounded at meeting with an absolute refusal to entertain their propositions. Their astonishment increased almost to stupefaction when certain hard-pressed legislators resigned their membership in the A. P. A. in order to regain independence for their votes. When the vote was taken at about eleven A. M. of that day, it was found that not a single vote had been influenced even by the personal presence and angry threats of the Butte delegation.

A Staunch Protestant.

Boulder, Montana, January 18, 1895.

HOME MARKET NOT ENOUGH.

To the Editor of The Nation:

Sir: Last week in Cincinnati a convention was held at which a National Association of the Manufacturers of the United States was organized. Over 400 delegates, representing all parts of the country, were present. The ceremonies were opened by a speech from Gov. McKinley, and the politics of a large majority of those present was intensely Republican. The spirit, however, which pervaded the entire proceedings of the convention is most significant, for it is remarkable that a large group of manufacturers should meet at a time of depressed business, especially after a reduction of the tariff, and not in any way attempt to draft a resolution asking for a restoration of duties. On the contrary, these men here inaugurated a new policy—that of extended foreign trade. At last they find America is not big enough for Americans!

The basis of this movement was a fact presented by Mr. M. E. Ingalls in his speech on Wednesday last. He stated that since 1860 our population had increased about 170 per cent., while our manufacturing interest had developed 800 per cent. The proceedings of the convention were all termed "protective"; but is not this word beginning to have a new significance? The strongest expression of a high-tariff character passed by the convention is the following sort of platform embodied in its constitution:

"To the largest possible extent our home

market should be retained and supplied by our own producers, and our foreign trade relations should be extended in every direction and manner not inconsistent therewith."

Very truly yours,

JAMES B. STANWOOD.

CINCINNATI, January 27, 1895.

INFLUENCE OF COLLEGE-BRED MEN.

TO THE EDITOR OF THE NATION:

SIR: The paragraphs in the *Nation* of December 20, 1894 (p. 465), making the fifty-three "immortals" whose names are inscribed on the drum of the dome of the new House of Representatives in Boston a text for emphasizing the influence of college-bred men, are wholesome reading, and seem to have been much commented on in college journals. They have called to my mind an investigation made some years ago to ascertain what proportion of the signers of the Declaration of Independence and of the framers of the Constitution were college-bred men. So far as I could ascertain from 'Appletons' Cyclopædia of Biography,' of the fifty-six "signers" twenty-six were college graduates, while ten more received classical training, though they did not attend college. Of the twenty-six college-bred "signers," Harvard furnished eight—Samuel Adams, John Adams, John Hancock, William Ellery, Elbridge Gerry, R. T. Paine, William Hooper, and William Williams; Yale four—Oliver Wolcott, Philip Livingston, Lewis Morris, and Lyman Hall; Princeton two—Richard Stockton and Benjamin Rush; William and Mary three—Thomas Jefferson, C. Braxton, and George Wythe; College of Philadelphia three—William Paca, Matthew Hopkinson, and James Smith; Cambridge (Eng.) three—Arthur Middleton, Thomas Lynch, and Thomas Nelson; Edinburgh—John Witherspoon. James Wilson studied at Edinburgh, St. Andrews, and Glasgow, and Charles Carroll of Carrollton at several foreign Jesuit colleges, as well as law at the Temple.

Of the sixty-one men commissioned to attend the Constitutional Convention thirty-one were college-bred, and five of the remainder had what might be called a liberal education, though they did not attend college. Of these Harvard furnished six—Rufus King, Elbridge Gerry, Francis Dana, Caleb Strong, John Pickering, and Benjamin West; Yale four—Abr. Baldwin, Jared Ingersoll, W. S. Johnson, and Wm. Livingston; Princeton nine—James Madison, Gunning Bedford, Jonathan Dayton, Oliver Ellsworth, Luther Martin, Alexander Martin, Wm. Patterson, W. C. Houston, and W. R. Davie; William and Mary five—John Blair, Edmund Randolph, George Wythe, James McClurg, and J. F. Mercer; Columbia (King's) two—Alexander Hamilton and Gouverneur Morris; College of Philadelphia two—Thomas Mifflin and Hugh Williamson; Oxford (Eng.)—Charles Cotesworth Pinckney; Glasgow—R. D. Spaight; Edinburgh, St. Andrews and Glasgow—James Wilson.

Of the thirty-nine whose names were appended to the document, seventeen were college-bred men.—Very respectfully,

CHARLES FORSTER SMITH.

UNIVERSITY OF WISCONSIN.

Notes.

CHARLES SCRIBNER'S SONS will issue at once Dr. Parkhurst's work, 'Our Fight with Tammany,' and 'A Creedless Gospel and the Gospel Creed,' by Dr. Herbert Y. Satterlee.

Prof. Skeat is engaged upon a volume supplementary to the six of his Oxford edition of Chaucer, just completed. It will contain the prose "Testament of Love," and the chief poems attributed to Chaucer and published with his genuine works in old editions. Macmillan & Co. will publish it.

Houghton, Mifflin & Co. have in press 'The United States Internal Revenue Tax System,' with text of all laws now in force, including the income-tax law, by Chas. Wesley Eldridge; 'Half a Century with Judges and Lawyers,' by Joseph A. Willard; 'The Fast and Thanksgiving Days of New England,' an historical study by the Rev. Wm. De Loss Love, jr.; 'Louisiana Folk-Tales,' in French and in English, by Prof. Alcée Fortier; and 'Stories of the Foot-Hills,' by Mrs. Margaret C. Graham.

Since we noticed, something more than three years ago, Seyffert's 'Dictionary of Classical Antiquities' (London: Sonnenschein; New York: Macmillan), the work has passed to a second and now comes to us in a third edition. It is still worthy of the praise we gave it, and the much-needed index has been supplied. We wish we could flatter ourselves that our other strictures (not profound, to be sure) had been heeded, but they have not. As Aristotle's 'Constitution of Athens' was caught up for the second edition, so Monro on the Modes of Greek Music and Dörpfeld's latest views on the theatre have been availed of for the present issue. The book remains a very handsome one, with more than 450 illustrations.

Just three years ago the Rev. John Wright, D.D., of St. Paul, Minn., issued a volume of one hundred and seventy duodecimo pages, entitled 'Early Bibles of America.' In the third edition, now at hand (T. Whittaker), the work has grown to almost five hundred octavo pages. In the interval many additional facts have come to the author's knowledge, and more editions have been studied. The result is a volume largely rewritten and much augmented, containing the completest account, within single covers, of the subject in hand. The treatment is historical, biographical, and bibliographical, embracing the history of the editions, accounts of editors and printers, the distribution and present location of copies of rare editions so far as ascertainable. Thirty-three facsimiles of title-pages are given, and in the appendices are many valuable facts. For instance, the author indicates where are to be found one hundred and twenty-five copies of Eliot's Indian Bible in its various editions, and he adds a table showing the prices which some of them have fetched at auction. One hundred and thirty-one copies of the Saur Bible are located, and thirty-two Aitken Bibles. More than twenty-two pages are devoted to a list of American editions, previous to 1860, not mentioned by O'Callaghan, and more than fifty pages to a priced list of all editions arranged by years. The whole is closed with an index which seems to be very exhaustive. It scarcely need be said that the new edition of Dr. Wright's work is what the first was not, a valuable addition to a branch of bibliographical literature that is exceptionally rich in editions and in perplexing problems. Special chapters have been prepared on Mexican and Canadian Bibles, and the author has endeavored to make his work the more reliable by visiting most of the collections where noted Bibles are preserved. The work is well printed and bound.

The late Austin Phelps marked the close of his long and successful career as professor of sacred rhetoric at Andover Theological Seminary by publishing the substance of the doctrines which he had for many years been inculcating in his lectures. Of the volumes issued under these circumstances, 'English Style in Public Discourse' (1883), which we then commended to its especial public, has recently been edited as a text-book for schools and colleges by Prof. H. A. Frink, under the title of 'Rhetoric: Its Theory and Practice' (Scribners). In spite, however, of the dignified grace of Prof. Phelps's style, and the interest and value which his teachings had for young orthodox clergymen of a generation ago, it is hard to see how in its old or its new form the treatise can now be used with advantage as a general text-book. Prof. Phelps's ideas in regard to rhetoric were those common when he was at his prime, and do not differ greatly from those developed in most of the older treatises. But the rapid increase in our knowledge of English usage has changed radically many of the dogmas of thirty years ago. Teachers and students now rightly demand a simpler system of classification, a more scientific method of instruction, fewer absolute rules of prohibition, more guides for positive action. To reproduce an example—however excellent at its time and in its place—of the older, dogmatically negative rhetorical system, is scarcely to render modern education a service.

Alexandre Dumas's 'Napoleon,' translated from the French by John B. Larner (Putnams), owes its publication in English dress to the unreasoning literary fashion of the hour. The original sketch has for a long time been known in schools as a reading-text of easy French. At first written in dramatic form, it still bears much of the fire and force of description with which Dumas originally endowed it, and of which Mr. Larner's translation does not by any means wholly deprive it.

Capt. Arthur L. Wagner, instructor in the art of war at the United States Infantry and Cavalry School, already favorably known as an author of military works, has published a handsome volume on 'Organization and Tactics' (B. Westermann & Co.). An historical consideration of the several arms and of their relations to each other in actual service, as well as a careful study of the departments of supply and of medicine and surgery, gives to the work a great breadth of scope. The task has been ably performed, and, like other books by the younger generation of American soldiers, has the noteworthy merit of copious illustration from the records of our civil war as well as from the histories of recent European wars. The full treatment of American examples will make the work indispensable to the American student, and will not diminish its interest in the eyes of European readers, who will find here a mine of new and valuable matter bearing upon the practical handling of armies in the field.

Another useful piece of work has been done by Surgeon (Lt.-Col.) Alfred A. Woodhull, U. S. A., in a detailed report on the medical department of the British army, studied in comparison with our own. The Secretary of War has authorized the publication (by Buxton & Skinner Co., St. Louis), and it will thus be brought to the attention of the general public as well as of the officers of the army. It deals in an instructive and interesting way with the qualifications and organization of the medical staff and with its work. The last includes examination of recruits, sanitary care of soldiers, of their barracks and huts, and

their treatment in all medical cases from trivial to grave. The organization of hospitals and the hospital service, the supply of drugs, of surgical instruments, the control of the dietary of the sick, the treatment of convalescents—in short, all the multifarious administration of the medical department, is lucidly discussed.

'In the Heart of the Bitter-Root Mountains,' by "Heclawa" (A. L. A. Himmelwright), which bears the imprint of the Putnams, is noteworthy as containing probably the best map ever published of the huge nest of mountains in central Idaho, west of the main ridge which forms the divide between that State and Montana, though the scale is too small to show much detail. This region was first traversed by Lewis and Clark in 1805, and again in 1806, and we hardly heard anything more about it till 1854, when Mullan followed the Lo Lo or Northern Nez Percé trail, and made a sketchy route-map which was published in I. I. Stevens's volume of the Pacific Railroad Reports. It became somewhat better known during the Nez Percé war, when Howard and Gibbon chased Chief Joseph through Idaho. The best map we have between Lewis and Clark's (published in 1814) and this one of Mr. Himmelwright's, is a scarcely known sheet, twenty-five miles to the inch, by George Benson Nicholson, 1866, published with a pamphlet of the Northwestern University of Illinois, May 1, 1887, by Prof. Oliver Marcy, entitled "The Lou Lou Trail." None of the various other maps we have examined—both civil and military—are of the slightest value; for it is a fact that an area in Idaho larger than some of our States is less known geographically than some equal areas in Central Africa and within the arctic circle. Mr. Himmelwright's book is the story of the Carlin hunting-party in that region, which acquired such sensational notoriety a year or so ago from the distressing incident of the abandonment of a cook, moribund with uræmia, to save the lives of the rest. This seems to have been justified by the extremity to which the party were reduced, and should not have made a scandal; the real criticism to be passed is, that those young fellows had no business to be in such a place at that season of the year.

'In Cairo and Jerusalem' (A. D. F. Randolph & Co.), by Mary T. Carpenter, consists of sketches of scenes in and about these two cities. The author has some ability for graphic description, but her work is marred by carelessness and occasional flippancy. The chapters descriptive of the sheikh's house, the Copts, and the Jewish colony near Jerusalem are the most interesting. A striking proof of the change coming over Palestine is the fact that while thirty years ago there was not a house outside of the walls of Jerusalem, "now a solid flank of hospitals, convents, and dwellings reaches out almost as far as the eye can see." The price of land has risen in some instances twenty-four-fold. The largest proprietors are apparently the Russian monks, who "have acquired almost one-fourth of the city."

The Japan Society in London gives evidence of an active life in having on December 31, 1894, 634 members. The president is the Japanese Minister, the Viscount S. Aoki, and the honorary secretaries have their office at 20 Hanover Square, London, W. In volume second of Transactions and Proceedings in 1892-3 there are two valuable papers. Consul-General N. Okoshi writes upon Japanese proverbs, in which, besides giving a list of several score of these coins of speech, he shows how Japanese children learn them from the alphabet "proverb cards," on each of which is one of these products of "the wisdom of many and the wit of one." The large number of figurative expressions is also interesting, but these reveal the almost total lack of personification characteristic of the Japanese and other languages of Chinese Asia. Mrs. C. M. Salwey, the daughter of Dr. Birch of the British Museum, writes on Japanese fans. By her analyses and descriptions she shows how astonishingly large a place the fan holds in Japanese etiquette and economy, as well as in history and æsthetics. The folding fan is a pure Japanese invention, and, according to the testimony of Chinese historians, was introduced into China from Japan in the fifteenth century, while the flat fan is an evolution from the palmetto-leaf. With annotations by the learned secretaries and a description of the loan exhibition of fans, the paper is richly reinforced. It is not probable, however, that, in the present war with China, the iron-boned fan so much in vogue with the mediæval Japanese commanders is any longer used as a weapon either of offence, defence, or indication.

The Filson Club of Louisville, as number 10 of its publications relating to the history of Kentucky, has issued a sumptuous volume, by Richard Ellsworth Call, on the Life and Writings of Rafinesque. Constantine Samuel Rafinesque, the son of a Frenchman by a German wife, born in Turkey, educated in France and Italy, later a merchant in Sicily, a naturalist, professor of languages, and quack doctor in America, was one of the most eccentric characters in our early scientific annals. His relation to Kentucky arose from his appointment in 1819 to a professorship in the Transylvania University at Lexington. The college was then honored by the presidency of Dr. Horace Holley (whose name is systematically misspelled throughout the volume), and had a distinguished reputation as a centre of learning. Rafinesque was its first professor of natural science and modern languages, and spent seven years in Lexington. He possessed much ill-digested learning, extraordinary enthusiasm for travel, collecting and naming plants and animals; colossal vanity, unusual credulity, and yet a singularly fertile mind. In the earlier part of his life he was an acute and prolific writer, especially on botany and ichthyology. Under the pressure of misfortune his mind gradually gave way, and his later writings are mere literary curiosities. Not without genius, his work is generally wanting in common sense. The chief result for American science left by his labors is a flood of contested, largely unidentifiable, names, over which authors have quarrelled from year to year. Prof. Call's memoir is sympathetic and interesting, and is supplemented by a useful bibliography of Rafinesque's publications, most of which are now very rare.

The first (January) number of the *Astrophysical Journal*, "an international review of spectroscopy and astronomical physics," can scarcely disappoint any of its friends and subscribers, unless there was expectation of elementary and popular papers. Nine articles fill the body of this issue, and their authors' names—Michelson, Barnard, Rowland, Riccò, Pickering, and others—are sufficient guarantee of the worth of the magazine, were any needed. Of course these papers are too technical for notice here, but we may record that Prof. Pickering writes on the discovery of variable stars from their photographic spectra, Mr. Ellery (her Majesty's astronomer at Melbourne) presents several drawings of Mars with the great 4-foot reflector last May and June, Prof. Riccò relates attempts at photographing the solar corona from the summit of Mount Ætna; and every one delighting in fine pictorial presentation will rejoice at seeing the excellent reproductions of Mr. Barnard's splendid photographs of the Milky Way. The departments of minor contributions, notes, and reviews are ample. The young and gifted editor of this new journal, by the way, Prof. George E. Hale of the University of Chicago, has just been awarded the Janssen prize of the French Academy for his original and successful researches in detailed photography of the sun's surface and surroundings.

To the January number of the *Nineteenth Century* Mr. G. A. Aitkin, well known for his interesting discoveries in eighteenth-century literature, contributes an astonishing "find" in regard to Defoe's 'True Relation of the Apparition of one Mrs. Veal,' hitherto supposed to be one of the most veracious lies in literature. In collating the text of the 'True Relation' he found in the British Museum copy of the fourth edition of the pamphlet a manuscript Latin note indicating that the writer had questioned Mrs. Burgrave, whom Defoe represents as seeing the apparition, as to the accuracy of the statements contained in the pamphlet, and had corrected his copy in the few details necessary to bring it into complete accordance with her experience. Further investigation has enabled Mr. Aitkin to verify several of Mrs. Veal's references to individuals, and to draw the moral that Prof. Minto was scarcely justified in calling Defoe "perhaps the greatest liar that ever lived."

A biography of D'Entrecasteaux, the famous French navigator who commanded the expedition in search of La Pérouse and explored the coasts of New Caledonia and Tasmania, by Baron Hulot, occupies nearly the whole of the last *Bulletin de la Société de Géographie*. It is illustrated by several portraits and charts. There are also accounts of a French expedition in 1860 in the western Sudan, and of a more recent exploration of the region lying in the French Congo between Stanley Pool and Loango on the Atlantic coast. The map, which is full of minute details, shows the care and diligence with which the possessions of France in West Africa are being exploited.

A brief review of the work done by the United States Coast Survey in Alaska during the year 1893 is contributed to *Petermann's Mitteilungen* for December, 1894, by Mr. A. Lindenkohl. The other articles are upon the orography of the Spanish Peninsula, the geology of eastern Central Asia, and the dynamics of the atmosphere. This number also contains the usual classified index of the geographical publications of the year. Though far from complete, it is significant as showing, not only by the absolute decline of this literature, but by its change of character and location, that the work of the explorer is nearly finished. The whole number of publications noticed is 762, against 851 for 1893, and 1,170 and 2,092 for the two previous years. Africa has dropped from 542 to 102, and occupies the last place among the continents; Europe heading the list with 192, America following with 138, and Asia 134. As compared with last year, Europe and Africa have lost, America has gained slightly, and Asia considerably. In a supplemental number Dr. Carl Sapper describes the physical geography of Guatemala. The accompanying maps show both the geological features and the distribution of the flora of the country.

The western section of the Siberian Railway is finished to Omsk, and passenger trains have been running between St. Petersburg and this place, a distance of 2,128 miles, since September, 1894. The time occupied is four and a half days. According to the report of our Consul-General Jonas, "the mountain section, 200 miles in length, has been constructed without tunnels, at a cost of only 87,000 rubles (about $43,500) per mile—that is, about 15,000 rubles less than the original estimate." This railway opens up an area of land suitable for agriculture, and especially wheat, as large in extent as the States of Illinois, Iowa, and Wisconsin combined. A tide of immigration is already turned thither from European Russia, 18,000 settlers having arrived last summer.

The Geological Survey of Missouri has recently published two colored maps—the Bevier and the Iron Mountain sheets—with pamphlets of explanatory text, the first being prepared chiefly by Mr. C. H. Gordon, the second by Messrs. Winslow, Haworth, and Nason. The maps are on a scale of a mile to an inch from original surveys, and in their published form are very handsome products of cartographic art. The text for the Iron Mountain sheet contains some interesting illustrations, one showing a group of large granite boulders produced by local disintegration; another presenting a general view of the St. François Mountains, a name here advocated for the peaks of the Iron Mountain district, composed of ancient rocks which gained their mountain structure and form even in pre-Silurian time, and which are thus to be distinguished from the surrounding upland of the Ozark plateau of horizontal Silurian and later rocks. The texts dwell especially on the economic products of the two districts, iron ores and coal.

In the January number of the *New England Historical and Genealogical Register* one remarks as important a contribution of deeds of the Mather family of West Leigh, Lancashire, 1609 to 1632, from Mr. J. P. Rylands of Birkenhead. Mr. Waters's "Genealogical Gleanings in England" continue with much fulness the wills of the Saltonstall connection, to which are added a Willoughby assortment, and many others. Edward Palmer of London (died 1624) would fain have set up an Academia Virginiensis et Oxoniensis in Virginia. "The scholars of the said University, for avoiding of idleness at their hours of recreation, shall have two painters, the one for oil-colors and the other for water-colors, which shall be admitted Fellows in the same College. And further my will and mind is that two grinders, the one for oil-colors and the other for water-colors, and also colors, oil and gum waters shall be provided from time to time at the costs and charges of the said College, beseeching God to add a blessing to these my intents."

A notable change has come over the *Photographic Times* (New York: 423 Broome Street), which now calls itself "an illustrated monthly magazine devoted to the interests of artistic and scientific photography." For a long time illustrated, it now makes pictures a leading feature, but the quality of its articles seems at the same time to be undergoing an improvement, and the magazine is much enlarged.

The Providence Public Library has begun publication of a Monthly Bulletin, which, as may be inferred from Mr. Foster's previous ventures, deserves a place on the reading-table of every public library. Here, for instance, in No. 1, are reference lists on Dr. Holmes, on the Korean war, and on Buddhism (apropos of Prof. Rhys Davids's lectures). The library has, we learn, an "invaluable bibliography of municipal government, comprising about 1,000 slips, and as yet unpublished," the work of a woman.

—The revision for the second time, but more thoroughly, of his 'American Commonwealth,' by Mr. Bryce (Macmillan), has been a labor little less arduous than that of the original composition. Besides the ordinary distractions of the political arena, Mr. Bryce has had heavy duties and responsibilities as president of the Board of Trade. He has, let us not weary in repeating, been further handicapped by the necessity of manufacturing his book in two countries separated from each other by a week's time and three thousand miles of space. The enumeration would still be incomplete which did not mention the difficulties inherent in the shifting nature of our own political development. One may see traces of this in the footnotes touching Dr. Parkhurst and the Lexow Committee, and in the footnote *not* written recording the recent extraordinary Republican successes in the South. Even so cool and intelligent an observer as Mr. Bryce must be at a loss how to interpret our latter-day manifestations. Happily the first half of his work looks after itself, with need of slight revision, since it sets forth the framework and practical working of our form of government, State and national. To the second part he has contributed four chapters from his own hand. In one he returns to Tammany, and does Mr. Oakey Hall the justice to say that no share in the Tweed Ring's booty was ever traced to him, while not omitting to notice that Mr. Wingate's "elaborate and unsparing portraits of these four gentlemen" in the *North American Review* "evoked from them no contradictions, and certainly gave rise to no legal proceedings," such as Mr. Hall thought it prudent to launch against Mr. Bryce in England. The chapter on the Home of the Nation is a consideration of physical conformation and climate with reference to the chances of a future division of the bulky republic, and of possible new types of man to be evolved. Mr. Bryce foresees an undivided union and hardly any singularity of type unless on the Pacific coast. His chapters on the South and the negro we discuss in another column. The former contains some striking expressions, as that "It [the South] has suffered, and been regenerated, by a terrible war"; that leadership, after the war, fell "chiefly to those white adventurers whose scanty stock of portable property won for them the name of 'carpetbaggers'"; and the reference to "those amiable traits in the national character which often survive the sterner virtues."

—The last half of Mr. Conway's second volume of the Writings of Thomas Paine (Putnams) is occupied by the 'Rights of Man.' In the first half we meet with that adverse discussion of Virginia's claims to the Western territory which Jefferson had to contend against when he subsequently bespoke Virginia's bounty for Paine. In the controversial letter to the Abbé Raynal occur some interesting Revolutionary annals by an eye-witness. There is also a new document recovered through the French of Condorcet, being Paine's answer to four questions on the legislative and executive powers. Incidentally in this volume many timely observations are to be found. "We seek not," says our author, in his letters on "Peace and the Newfoundland Fisheries," "a fleet to insult the world or range in foreign regions for conquest." And in "Prospects on the Rubicon": "It is an error very frequently committed in the world to mistake disposition for condition. France, with a much better permanent condition for war than England, is in a less disposition to enter into one; and this want of disposition in her is mistaken in England for want of condition." A like mistake was committed by France in the case of Prussia in 1870. Paine, again, was an apostle of copyright, alleging that "in all countries where literature is protected (and it never can flourish where it is not) the works of an author are his legal property." He took the view, which now seems statesmanlike, that it would be wise to admit new States to the Union as soon as formed, but to exclude their representatives from a vote in Congress till after the expiration of seven years. In selecting this period, as in predicting accurately the end of our Revolution, he was perhaps unconsciously influenced by what he called the superstition as to "seven" of his British countrymen.

—Among the many items apropos of Du Maurier's masterpiece, not the least interesting is the closeness with which he has stuck to the facts. One's first impression upon reading how Svengali taught Trilby to sing—how he hypnotized her and commanded her to imitate the sounds he made on his flexible flageolet—was, no doubt, that this, at least, was a flight of poetic license. It seems, however, to be well within the possibilities. A case which in all essentials covers it was reported as long ago as 1850 by James Braid, the first of the successors of Mesmer to approach the hypnotic sleep from the side of science rather than of charlatanism. After speaking of the heightened sense of hearing under mesmerism and of the increase of muscular precision, they make, he says, "feats of phonic imitation" possible which are truly astounding:

> "Many patients will thus repeat accurately what is spoken in *any* language; and they may be also able to sing correctly and simultaneously both words and music of songs in any language, which they had never heard before—*i. e.*, they catch the words as well as music so instantaneously as to accompany the other singer as if both had been previously equally familiar with both words and music. In this manner a patient of mine who, when awake, knew not the grammar of even her own language, and who had very little knowledge of music, was enabled to follow Mlle. Jenny Lind correctly in songs in different languages, giving both words and music *so correctly and so simultaneously with Jenny Lind* that two parties in the room could not for some time imagine that there were two voices, so perfectly did they accord, both in musical tone and vocal pronunciation of Swiss, German, and Italian songs. She was equally successful in accompanying Mlle. Lind in one of her extemporaneous effusions, which was a long and extremely difficult, elaborate chromatic exercise, which the celebrated cantatrice tried by way of taxing the powers of the somnambulist to the utmost. When awake the girl durst not even *attempt* to do anything of the sort; and after all, wonderful as it was, it was *only phonic imitation*, for she did not understand the meaning of a single word of the foreign language which she had uttered so correctly."

This is exactly Trilby's case (only more so), except that there is nothing to indicate in the report that "the patient" remembered Jenny Lind's songs and could reproduce them afterwards; but the formation of a trance-state memory is a sufficiently frequent phenomenon. The quotation is from Braid's 'Observations on Trance,' page 43.

—Nothing more forcibly illustrates the caution with which the mathematical interpretation of certain problems in terrestrial physics

should be received than the redetermination, with the aid of the formulæ used by Sir William Thomson (Lord Kelvin), which Prof. Perry now furnishes regarding the possible age of the earth. Somewhat more than thirty years ago Prof. Thomson announced, as the result of an ingenious calculation based upon the loss of the internal heat of the globe, a time-limit to our planet of from 20,000,000 to 400,000,000 years, minimum and maximum, with a resolution to 100,000,000 years as probably most nearly representing the actual period. This conclusion, which has been received almost unchallenged up to the present year, is largely at variance with the views held by many of the more advanced geologists, who see in the slow making of rock-masses and the numerous revolutions and changes which the organic life of the globe has passed through, evidences of a far greater antiquity than the physicists of the Thomson school were willing to concede. Prof. Perry, who is himself a pupil of Lord Kelvin, now comes to the assistance of the geologists by stating (*Nature*, January 3), that if we assume, as we properly may, higher conductivity for the internal materials of the earth than we know to belong to the materials of the so-called crust—a very likely condition under the excessive temperature of the interior—then the Thomson limit of time must be very measurably increased; and, indeed, a startling calculation is made to show that "even for a perfectly solid earth an age 1,300 times the age given by Lord Kelvin" is not necessarily incompatible with such facts as are now known to us. In a personal letter addressed to Prof. Perry, and bearing date of December 13, Lord Kelvin admits the force of Prof. Perry's arguments, and, with a true scientific submission, says: "I thought my range from 20,000,000 to 400,000,000 was probably wide enough, but it is quite possible that I should have put the superior limit a good deal higher—perhaps 4,000 instead of 400."

—Meteorologists seem to be unanimous as to the necessity for investigation at high altitudes in free air—that is, as distinct from mountain stations. These last do not meet every requirement, because they are, after all, only points on the earth's surface, and therefore present different phenomena from those at great elevations removed entirely from the earth. Prof. Harrington, in a recent number of *Aeronautics*, recommends systematic exploration of the upper air by kites and by balloons, both with and without aeronauts. Pilot balloons carrying self-registering instruments are always of use; one such, in March, 1893, reaching a height of ten miles. But he considers that the best exploration of free air may be accomplished by a meteorologist himself making the ascent twice a day in a balloon with the instruments, taking a constant series of notes, reaching a height each time of about 20,000 feet, and persevering in all weathers and seasons. This more than any other method would add to that accurate meteorological knowledge which alone can be depended upon for forecasting the weather. Probably the first to attempt high-altitude observations by kites was Mr. E. Douglass Archibald of England, who sent up anemometers and obtained records of wind-velocity at a height of 2,000 feet. Later Mr. William A. Eddy of New Jersey perfected a kite which flies very steadily. A number of them strung "tandem" have reached altitudes exceeding a mile, with important instruments attached. Among other facts obtained with reference to aerial eddies was the rather interesting evidence that marked ascending air-currents prevail beneath cumulus clouds. Experiments made by M. Hermite of Paris, in 1892, with a balloon carrying automatic instruments, resulted in the balloon's reaching a height of 52,500 feet, or about ten miles. While the French experiments give many valuable results, their accuracy is lessened because the increased direct radiation of the sun was disregarded. But Dr. Assmann of Berlin has experimented for over two years in perfecting self-registering instruments which will work undisturbed at high altitudes. His accounts, in the *Zeitschrift für Luftschifffahrt*, of the voyages made by his balloon *Cirrus* carrying these instruments, is of great interest. The first attempt was in May, 1894, in the presence of the German Emperor. In July a second ascent was made, the balloon reaching this time a height of 53,560 feet, the greatest yet attained by anything made by man. All these attempts are treated at some length in the last numbers of the *American Meteorological Journal*.

—To explore the Korean language and literature will be the task of American missionaries and scholars for some years to come. Besides the monthly *Korean Repository*, already announced as projected at Séoul, we are in receipt of a valuable monograph of 250 pages on 'Korean Grammatical Forms,' by James S. Gale (the title of "Reverend," either whole or abbreviated, seems to be dropping off rapidly in the mission fields as at home). On a large page are given the written forms of actual examples of Korean speech taken from the lips of natives in various parts of the kingdom. The sentences are printed in *en mun* (native alphabetic characters) and in English translation with Roman letters. A valuable feature is a pair of parallel vertical columns on the left, wherein are shown and contrasted the variations between *en-mun* print, or book-form, and the actual vernacular. As the Korean alphabet is used almost wholly for the expression in translation of Chinese books, the *en-mun* standard forms do not give *all* the colloquial endings. The novels and children's tales are a little more copious in this respect. The student who wishes comfort and economy of eyesight is not likely to attack a native edition while this luxury of white paper and good ink, clear type and fair margins, is before him. One is freshly impressed, in examining this scholarly work, with the likeness in structure of the Korean language to the Japanese, the amazing wealth of conjunctions and honorifics, and the notable variations between the spoken and written forms. The impact of Western ideas will doubtless, as in Japan (where nothing short of the reconstruction of Japanese rhetoric is proceeding), compel the shortening of sentences, and economy in the use of honorifics and conjunctions. The book is printed at the Trilingual Press, Séoul, and seems remarkably free from misprints.

SIR JOHN MACDONALD'S MEMOIRS.

Memoirs of the Rt. Hon. Sir John Alexander Macdonald, G.C.B., First Prime Minister of the Dominion of Canada. By Joseph Pope. 2 vols., 8vo. London: Edward Arnold; Ottawa: J. Durie & Son. 1894.

THE political admirers of the astute Canadian Premier who died at Ottawa in June, 1891, will find much in Mr. Pope's memoirs on which to felicitate themselves and the Tory chieftain's enthusiastic following. Mr. Pope, it must be said, has done well for his subject, having, to be sure, as Sir John Macdonald's private secretary for a number of years and his accredited biographer, had unusual advantages, including access to state documents and official as well as private correspondence, extending over half a century of Canadian political life. The subject of these memoirs, on the other hand, is fortunate in having as the annalist of his times not only a well-informed writer and loyal friend, but one who had known the Dominion Premier only in later life, when he had cast off a good deal of the "old Adam" in him, and attained to the hard-won honors and dignity, the awards of a long, active, and, on the whole, useful career. We note this at the outset, since it accounts for the laudatory strain which, quite pardonably, runs through the memoirs, and for the fervor of the annalist who treats of the history, not quite so pardonably, from the point of view of the book's decorated and successful hero. Mr. Pope is, of course, right in being loyal to his late chief, and, in the literature of many present-day political memoirs, he can cite innumerable examples of writing history through the spectacles of him who has made it. We nevertheless regret, in the present case, that forty years or so of stormy Canadian history should not have been written with more judicial impartiality and less under the influence of close contact with the red ribbon of the Bath. Mr. Pope's work, however, must be taken for what it is worth, and that is not little, bearing in mind, as one reads it, that it is idle to look in personal memoirs or their equivalent—the life-record of an active participator in contemporary events—for the neutrality of the historian. The frank partisanship of the volumes (especially that of the first one) has, on the other hand, this value, coupled with the fact that the narrative is authoritative, that it presents the Tory as well as the individual case in the long and eventful history with which the work deals; and this must be of importance to the writer of any independent survey of Sir John Macdonald's era who may hereafter appear.

The interest of the biography to readers on this side the boundary line is obviously not great, except as it manifests the policy of isolation and unfriendliness which marks the attitude of the Tory party in Canada in its relations with the United States. We get an instance of this policy not only in the ultra-British tone of Ottawa politics, but more markedly in the manner and bearing of Sir John Macdonald towards our commissioners at the time of the Washington Treaty. The biographer, in dealing with the treaty and the Ottawa Premier's connection with it, as one of the imperial commissioners specially charged with Canadian interests, lets us see how hard a bargain Sir John desired to make, and how much he antagonized his British fellow-representatives in pressing Canadian claims upon the Commission, in the matter of the fisheries and the coasting trade. But for the friendliness of Lord de Grey and his English colleagues, and their desire, jointly with our own representatives, to bring the conference to a satisfactory issue, the negotiations, we see, came perilously near overthrow. Sir John Macdonald's letters to his Canadian colleagues on the negotiations will be found curious reading to our statesmen and people, while they show how aggressive was the Canadian commissioner's temper, and how insistently he fought for his own hand, in spite of the advantage which Canada was to gain in submitting the fisheries clauses of the treaty to separate appraisement and compensation by the United States. Not less

curious reading will these letters be to British diplomatists, with the frank avowal of their author's artfulness in setting the British Colonial Office against the Foreign Office, in his efforts to obtain support for his views at the conference.

The interest Canadians must have in these Memoirs admits of little doubt, though Dominion Liberals will, of course, have no sympathy with the biographer's Tory sentiments or with the party tinge given to the political history. Especially obnoxious, we imagine, will be the picture drawn by Mr. Pope of the Hon. George Brown, long the head and front of the Reform party in Canada, and for fully thirty years the political adversary of the Canadian Premier. Canadian methods of political warfare are doubtless not heavenly, and Mr. Brown was not only a formidable, but an irritating as well as ambitious opponent. Yet one can hardly deny him the merit, which his party shares, of fighting valiantly for reforms which the Tories continuously and stubbornly resisted, and that during long years of bitter political strife, unsolaced by either the honors or the emoluments of office. Throughout the first volume Mr. Brown is the biographer's *bête noire*; and, if we except the brief interval of cessation from political strife which heralded confederation, unconcealed is the animus with which he writes of him. Only during the period of the Coalition Government of 1864 are the lights softened on the harsh portrait of the great Liberal chief, while everywhere else in the book his memory is held up to ridicule, if not to execration. This, no doubt, in the biographer's view, is only Mr. Brown's desert for the life-long hostility of a rancorous political opponent towards the hero of his pen. This, also, we suppose, is his due for persistently and fanatically attacking Mr. Pope's coreligionists, the Roman Catholics of Quebec, in his personal organ, the Toronto *Globe*, and for flinging truceless defiance in that journal and on the stump at Torydom and all its works. The picture, nevertheless, we repeat, is a harsh one—harsher, indeed, than Sir John Macdonald, much as he disliked Mr. Brown, would have himself written, had he lived to review with his own pen the political contests that have passed into history, with the justification which time has placed upon the clamor as well as the accomplished work of reform.

The era immediately succeeding the Rebellion was the turning-point in the political history of the Canadas. It is the era in which reform was to see its work crowned in the overthrow of the oligarchical "Family Compact," in the application of the elective principle to the irresponsible legislative council, and the full attainment of responsible government. This is the period at which Sir John Macdonald entered political life, and the reader who knows anything of Canada's political past will naturally turn to it as a test of the writer's ability intelligently to deal with it. Need we say that its effective treatment should call into play the active sympathies of not only a well-informed but a strictly dispassionate writer, one who can speak for Liberalism as well as for Toryism, with a strong leaning just at this juncture towards the former rather than the latter? Unhappily, just here Mr. Pope disappoints his readers, for the history of the time, where it is not merely skimmed over, is made to glorify the subject of these memoirs and to cast a sneer at political principle when put forward by Liberals as a rule of action. Of grave moment were the questions that agitated the country at this period. They included such topics as the demand for responsible government, representation by population, secularization of the clergy reserves, abolition of seigniorial tenure, and compensation for rebellion losses. These were followed, a little later, by the agitation over the seat of government, which brought with it the episode of George Brown's two-day administration, and its Tory pendant, the "Double Shuffle," a tricky evasion of the constitutional rule which requires ministers, on taking or resuming office, to go to their constituencies for reëlection. Mr. Pope's treatment of these varied questions is, of course, in harmony with the attitude towards them of his late chief—an attitude which may be summarized by the writer's unqualified denunciation of Lord Elgin, and his extravagant praise of Sir Charles Metcalfe and Sir Francis Bond Head. The biographer's political bias is specially apparent, not only in his dislike to Lord Elgin, but in his withholding from that Governor the commendation which is his due for negotiating a reciprocity treaty between Canada and the United States, at a time when the outlook in the colony was particularly gloomy, and when even prominent Conservatives had but lately signed a manifesto in favor of annexation. Referring to this able Queen's representative, it is not a little curious now to recall the fact that it was Mr. Gladstone, then a Conservative, who in the English Commons attacked the Rebellion Losses Bill (a bill, it was said, for indemnifying rebels) assented to by Lord Elgin; and Lord John Russell, a Liberal, who defended the measure, and approved of the Governor-General's course in following the counsels of his Canadian constitutional advisers.

With more satisfaction do we pass to the chapters on the Confederation of the British American Provinces, in 1867, and to agreement with Mr. Pope in lauding Sir John Macdonald for the statesmanship manifested in this his crowning work. The task was herculean, as the aspiration was commendable, to knit together, under one federal government, the far-scattered peoples and sections of what now forms the Canadian Dominion; and Sir John Macdonald fully merits the chief credit in founding the new nation and in putting it on its feet. But the accomplishment of this great task was possible only through the coalition of parties, in 1864, and through the self-sacrificing aid of the Hon. Mr. Brown and his friends, for which Mr. Pope has, for once, the grace to be thankful. While Canada rightfully plumes herself upon the high status to which Sir John Macdonald, through this measure, was instrumental in advancing her (though, in passing, it may be said that he did not get his will in creating a "kingdom," rather than a dominion, to the north of us), it must not be forgotten that the new era owes as much to the deadlock of parties as it owes to the labor of any one individual politician. Indeed, so desperate, politically, was the situation that confederation was not submitted for the consent of the people, and in one province at least had to be forced upon it by arts which it would be a farce to call moral. To this day even, the province we refer to has to be maintained in the union by subventions, familiarly known as "better terms," and by vast expenditures of money upon so-called public works, to the serious augmentation of the Dominion debt. This, however, is the seamy side of the fabric which Canadian statesmen, or their friends for them, have bandied words with each other for the credit of weaving. Mr. Pope, though in this matter he does justice to Mr. Brown for the timely assistance he rendered his fellow nation-builder, gives more credit to Sir Alexander Galt than to any other member, besides Sir John, of the coalition Government who took part in carrying the measure. But we need not take issue with Mr. Pope in this matter. The father of Confederation, as Mr. Goldwin Smith once aptly said, was "Deadlock," and neither lofty nor patriotic were the political morals that brought about legislative deadlock in the shifting pre-Confederation administrations of the colony.

The founding of the Dominion lifted Canadian politics to a higher plane, and had a steadying and elevating effect upon Sir John Macdonald himself, assisted happily at this time by the restraining influences of his second wife, a lady of strong character and high social ambitions. The new era was full of opportunities for the exercise of Sir John's vast resources as a politician, his great skill in managing men, and his intimate knowledge of the needs of the country. There was the trouble first to be got over, however, in conciliating Nova Scotia, the province by the sea, which, led by its able son, the Hon. Joseph Howe, was averse to union with the old Canadas; and there were also difficulties in the far West, in obtaining possession of the surrendered domain of the Hudson Bay Company, and in attaching the crown colony on the Pacific to the Dominion. But the fates were propitious; and where they were menacing or churlish, political manœuvring, at which Sir John Macdonald was an adept, managed to smooth the path, though it was soon to bring about disaster in an unexpected quarter, in connection with the railway policy to which Confederation committed the central Government. In the affair of the Pacific Railway scandal, Mr. Pope contents himself, in the main, with setting before the reader Sir John Macdonald's own defence of himself and his incriminated Government. This takes the form of a long and exculpatory letter from the Premier to Lord Dufferin, then Governor-General, in which the First Minister rather unchivalrously shelters himself behind his dead colleague, Sir George Cartier, and, in the absence of a Carlton Club in the colony, pleads the necessity of "meeting fire with fire" in election campaigns, if he was to succeed in maintaining Conservative rule in the country. The result, as is well known, was the overthrow of Sir John Macdonald's Administration and the exclusion of the Conservatives from office for a period of five years—until, in fact, the formulation of the "National Policy" (protection for native manufactures) restored the party and its pardoned head to power. This occurred in 1878, when these memoirs practically close, if we except a chapter on Sir John's personal views on Imperial Federation and Irish Home Rule, and one narrating the facts concerning his last illness and death.

The story told in these Memoirs is well put together, and, allowing for its source, is by no means lacking in political interest. We could have wished that the writer had been more neutral and less swayed by a desire to "blacklist" his late chief's political opponents, with some even of his personal friends, and at least two of his quondam colleagues who had, for one reason or another, become obnoxious to him. On the other hand, we could have wished for more of a personal portraiture, exhibiting Sir John Macdonald as he was known to almost every Canadian, in the weakness as well as the strength of his individuality—serious in the council-room, witty in the legislative chamber, and human everywhere. Aside from the charm and *bonhomie*

of the man, it would of course not be difficult to solve the secret of his almost unvarying success, unless one's eyes were shut to, or the mind ignorant of, the methods of politicians in playing in our modern age the party game. To be just, however, there were more and higher things in Sir John Macdonald than the questionable gifts of the dexterous party leader and cajoler of his fellows. The enduring factors of his fame, besides administrative ability of a high order and hearty sympathy with the national aspirations, include personal honesty and a life of toil in the disinterested service of his country.

NINE NOVELS.

The Greater Glory. By Maarten Maartens. D. Appleton & Co.

A Change of Air. By Anthony Hope. Henry Holt & Co.

The Indiscretion of the Duchess. By Anthony Hope. Henry Holt & Co.

The God in the Car. By Anthony Hope. Appletons.

The Matchmaker. By L. B. Walford. Longmans, Green & Co.

Love in Idleness. By F. Marion Crawford. Macmillan & Co.

My Lady Rotha. By Stanley J. Weyman. Longmans.

Eyes Like the Sea. By Maurus Jokai. Translated from the Hungarian by R. Nisbet Bain. G. P. Putnam's Sons.

Timar's Two Worlds. By Maurus Jokai. Authorized translation by Mrs. Hegan Kennard. Appletons.

MR. MAARTENS is an exceptionally clever writer, a sayer of sayings, an observer of manners, a dissecter of morals, a moralizer upon life, a cynical humorist, a humorous cynic, a poet, a visionary, and a passionate enthusiast for freedom so far as it concerns the poorer half of humanity. Each of his novels breathes more or less of all these traits. His latest, 'The Greater Glory,' runs riot in them all, but particularly in that tense "scorn of kings" and passion for social revolution which have made so many a novel dull. To scourge the sins of Holland by merciless delineation of its morals and customs is one thing; to confront the reader of a novel with rhapsodies most like the pamphlets of socialism is another. In short, tensity is the sin of style into which this very able writer is falling. The interest of his book demands not less enthusiasm, but a lighter touch. We confess to a distinct weariness of the child of luxury who takes an incognito in the slums and writes poems for *The Cry of the People.* Nor do we find a convincing differentiation between the displaced Baron and the usurping Count. For all the details crowded upon them, they do not stand out in vivid relief from each other or from any one else. The author's burning-glass light after all does not illuminate. It is too glaring. The pictures of Dutch society, the jealousies between the "Mevrouws" and the "Juffrouws," "a distinction to be fathomed only by a Dutchwoman," the passing flashes thrown upon life's miseries and life's consolations, are in Mr. Maartens's wittiest and keenest mode; the disappointment lies in the prolixity of the story (at bottom a passable one), and in the telling of it with that mixture of irony and indirection which is at once searing and bewildering. But the world cannot afford not to hope for more writing from the pen that says: "The Dutch, great in painting, are dead to poetry. Even in painting, imagination is a sin. It was by imagination that our common mother fell. Had she been content to perceive that an apple is an apple, she might have been in Paradise at this hour as many a substantial Dutch burgher-mother is."

Anthony Hope's 'Change of Air' has the fresh sprightliness of all his works: the light and lively handling, the skill in keeping the little craft of story jauntily afloat, and the half-stagy dénouement, which frequently in Mr. Hope's stories holds a side glance towards dramatization. The sub-hero, Philip, is the real interest of the book in characterization—a sort of George Warrington figure, on whom is saddled the wisest and best of the book. The author loves him and has made him delightful. The hero, the genius, is more interesting to the women and men who surround him than the reader can well understand, but the hubbub his vagaries create in a country town is real enough, even to the inanities they give rise to. A good deal of padding has been done to supply the *dramatis personæ*, and rather shapeless padding some of it is; but on it, as on a background of not uncomfortable cushions, one may pass an hour of temperate amusement.

'The Indiscretion of the Duchess' returns to the vein of 'The Prisoner of Zenda,' but in no way repeats that story. Mr. Hope's devices in plot-making are distinctly his own. The most surprising inventions flow from his brain in novel combinations. Nineteenth-century adventures though they are, they are told with an old time air of romance that gives them the fascination of an earlier day; an air of good faith, almost of religious chivalry, gives reality to their extravagance. They come near to being pious. Moreover, what is lacking in many excellently told stories is the very sauce of the feast here, namely, a cleverness in epigram which marks Mr. Hope as a wit if he were not a romancer. Many thrilling tales have been written without containing such shrewd observations as these: "Discretion has two meanings—whereof the one is 'Do it not,' and the other 'Tell it not.'" "We do not always wish and hope for the same thing."

In 'The God in the Car' Mr. Hope strikes a note differing from any other in his lengthening scale—a note of less clarity and beauty than the others, but not without force. A man who rides, a Juggernaut, over all that lies between him and his ambition is a good subject for a story. To make the story good, however, there should be proof, not statement only, of Juggernaut's compelling power. This Juggernaut, who subdues men, women, and children to his will, and steps on them to rise, is such an intolerable boor and bore that his influence is hard to believe in. It is easier to side with the few who snub him than with the ninety and nine who let him ride over them. One must, therefore, admire the plan rather than the execution of this story, and be grateful for a liberal meed of brilliant sayings in Mr. Hope's most shining style—enough (sinister thought!) to make a calendar withal.

If there is the "patter" song, there is also the patter novel, and Mrs. Walford is its prophet, if not creator. 'The Matchmaker' is a very fair specimen of the school. It goes on and on amiably, observantly, humorously. The average mood of the average man and the average woman is reproduced with a skill which speaks well for the author's clear-sightedness and deftness of pen. To lend shadow to the monotone of every-day life, the dramatic and even the tragic are here and there invoked with not too great shock to the unities. It is well-trained, expurgated tragedy, on the whole, suitable for family use, and we fancy in Mrs. Walford's mind a preference for the domestic scenes to the glare of melodrama. She describes with positive unction, and as if from sheer exuberance of the humdrum, the village characters and their tiny concerns, but about her villains hang traces of bored conscientiousness. The fluttering anxieties of two spinsters about "the doings at the castle" fill page upon page; the childish banalities of the ladies of the castle fill pages more, so fatally well done as to carry their tiresome quality along with them, to some extent. The heroine who flashes like wildfire in and out, among the placidities of her fossilized kinsfolk in their Scotch island, is a merry, natural creature, young, piquant, meddlesome. The poor thwarted girl whose unhappy love story makes the tragedy of the book is possible enough for the purposes of a story, and is drawn with curious alternations of elaboration and vagueness, And, after all else is said, there remains enough old-fashioned love-making to yield the old-fashioned reader a modicum of calm enjoyment.

'Love in Idleness' is a charming name for a story. Bar Harbor is a charming place. Macmillan & Co. have published Mr. Crawford's story in noble print, on regal paper, with copious beautiful reproductions from photographs and less beautiful ones from drawings. The cover is stamped with a pretty gold network of flowers and leaves, a heart, and Mr. Crawford's autograph. There is some bright talk between the hero and the Professor on the boat which is taking them and the reader to Mt. Desert, but the fencing between the colorless hero and the repellent heroine is so near to slugging that one wishes there were more idleness and less love; decidedly Miss Fanny Trehearne should be disqualified by the umpire from playing. But ramble as he will from his highest standards, Mr. Crawford never fails to say many things that no one else says quite as well.

'My Lady Rotha' has the excellences of Mr. Weyman's other stories—their special qualities of adventure and chivalry woven into a whole whose interest is heightened by the glimpses into history which they furnish, adequately for the story-teller's purpose, indeed, yet ostensibly rather than really. There is a strange likeness in the local colors used to depict Holland in the time of Bloody Mary, Paris in Richelieu's day, and Germany during the Thirty Years' War; but it is always a coloring removed enough from the contemporaneous to make the reader feel that he is moving in a stirring past, and to soothe his mind with a gentle complacency at the thought that in these attractive tales he is reading history. We trust that Mr. Weyman will not seek to heighten the excitement of his stories by piling Ossa on Pelion in the matter of military atrocities, but we perceive a slight crescendo in that direction, to be deplored if his works are to maintain their reputation as books in every way delightful for the young reader as well as the old.

"Fiction is ceasing to be a branch of art, and fast becoming, instead, a branch of science," says the translator of 'Eyes like the Sea.' By way of antidote he introduces to us one of Jokai's hundred and fifty novels, as a representative specimen of Hungarian literature, and as one that supplies in its features of incident, invention, and humor a wholesome contrast with other Continental novels of psychology, physiology, and pessimism. Maurus Jo-

kai, says the translator, may be said to have created the modern Hungarian novel; and he adds that to Jokai, a veteran, is largely due the fact that in a degenerating state of fiction elsewhere in Europe the Hungarian novel remains healthy and humorous. For ourselves, we confess that the "cheery" quality of Jokai's work, so insisted on by his translator, does not forcibly stand out. We should rather call his humor the mother tincture of cynicism. It is not bitter, it is even jolly, but with a jollity that sits upon a profound melancholy like bubbles on a whirlpool. "This is a world of illusion," he seems to say; "the only way to endure it is to joke"—an attitude less of cheer than of resigned pessimism. The interest of his book lies first in the autobiographic portions, which tell of Jokai's own experiences as author, and above all as sharer in the revolution of '48, with a stirring and affecting picture of those ever-moving days. Next, and chief feature of the work as a novel, is the clever portrait of Bessy, with eyes like the sea and career as varied as her eyes. She is a masterpiece of characterization. At each point where her adventures threaten to make her intolerable, her dazzling audacity, pluck, resource, and even a sort of misguided loyalty, compel the reader's admiration. The author has remembered always to leave a drop of humanity at its most courageous in his analysis of this eccentric creature, which saves her from being the conventional adventuress, and keeps the world her kin, however disreputable she may be. Finally, there is a plenitude of wit and epigram to be found in the Hungarian novelist, and a full appreciation of the kindlinesses of life, though no great belief in their abundance.

'Timar's Two Worlds,' by the same author, is a larger work, more romantic in its construction and more powerful in its situations; a more fully fledged novel, in fact. The story is laid on original lines and in scenes unhackneyed by description. The Danube at its fiercest, and a certain "ownerless island" in the Danube, which blossoms like the rose with idyllic harvest, form the background to a tale of rare and even terrible interest. The history of the downward trend of the man who permits himself the first false step, until he determines to bear no longer a life grown unbearable, is full of significance as a lesson to the sinner, while the miraculous rescue and the withdrawal of the hero to a life of pastoral love, and the wholly uneven distribution of punishments and rewards among the innocent and the guilty, make an equally forcible appeal to the artist and to the pessimist for whom so much modern novel-writing is done. From any point of view this is a striking, even a seizing book, and it alone would mark Jokai as a rare writer about whose work hang the indescribable atmosphere of genius, the fecundity of invention, the exuberance of phrase, the poetic instinct for the meanings of things material and spiritual, which distinguish those interpreters of life who stand as kings among their fellows.

American Book-Plates. A Guide to their Study, with examples. By Charles Dexter Allen. With a Bibliography by Eben Newell Hewins. Illustrated with many reproductions of rare and interesting book-plates. Macmillan & Co. 1894. Small 8vo, pp. 437.

FOR the last two centuries book-collectors have had a pleasant fancy of marking their ownership of books by pasting therein little labels, generally inscribed with their names. As forgeries are comparatively unknown, and as there is a very general desire to possess relics associated with the personal surroundings of great men, it is not surprising that these evidences of ownership add greatly to the value of the volumes so enriched. An autograph or a marginal note is more precious, but the book-plate seems to bring the past into immediate contact with us.

But, alas, this is the age of fads and clubs. Not content with a rational enjoyment in the possession of the books once owned by our heroes, the collector arises to collect indiscriminately, to classify whimsically, to reproduce, to exchange, and to found a new cult. The book-plate, extracted from its proper home, is placed in an album, and its worship is as absurd and futile as that of a collector of the shoe-buckles of the belles of the court of Louis the Great.

Of this phase we will speak later. Of course, there is one view in which a collection may be valuable. As these book-plates are really small engravings, they form a subdivision of the history of art. Such work has often employed able gravers, and some few plates are worthy of attention as works of art. Occasionally, also, the design is worth notice for its literary merit or attractive for its quaintness. But inasmuch as the primary object of the book-plate is to mark possession, and as books were peculiarly the property of the rich, it would be expected that the majority of book-plates belonged to persons now forgotten by posterity, and that the designs were mostly armorial or heraldic.

Mr. Allen's book on American book-plates is one which owes its chief importance to the existence of the new processes of cheap reproduction. To put it plainly, the main interest lies in the pictures with which it is liberally adorned, and which, like all such reproductions, give the reader a good general idea of the originals, at the sacrifice of all the finer points of the artist's work. Mr. Allen has evidently collected material assiduously, though he does not show any capacity for arranging it, nor for writing a clear explanation of the value of the examples. He lacks entirely the historical instinct which would place his collections in a proper sequence. Certainly he should have treated of the engravers in their chronological succession, instead of an alphabetical one. In regard to them his knowledge seems to be slight, and his biographies are merely condensed from former authorities, without acknowledgment.

At the very beginning of his introduction, Mr. Allen makes the following remarkable confession:

"The larger part of our early plates are armorial in character; and while heraldry forms so prominent and important a feature, it is left practically untouched in the present volume. The number interested in the science is small, *the authorities on coats-of-arms and on blazoning differ*, and the present writer had not the time to make the thorough investigation necessary to a satisfactory treatment of this interesting branch."

Now there is no other science more simple and exact than that of heraldry and blazon. It is easily learned, and forms an international shorthand. It is peculiarly adapted to the construction of book-plates, and its use thereon has been of the greatest service to the kindred pursuit of genealogy. By omitting this large and interesting branch of the subject, Mr. Allen has greatly diminished the value of his book. We also regret the affectation of rules and styles, which would have been discerned to be unnecessary had an historical arrangement by artists been adopted; and generally the pomp and ceremony attendant on the publication of what is merely a scrap-book.

To pass to the consideration of the material herein found is a more grateful task. The reproductions of the book-plates of Washington, Franklin, Adams, Webster, Isaiah Thomas, and Oliver Wendell Holmes appeal to our sympathies. We seem nearer to the original owners when we see the evidences of their taste in these decorations. The quaint fancies shown in the larger examples from colleges and libraries are doubly interesting in the history of colonial art. So, again, the designs originating within the last twenty years among the present generation of book-collectors and book-lovers are often curious, if not conspicuous for good taste. The list of known book-plates, signed by the engraver, will be of service in many ways, especially when supplemented by dates. The descriptions, at least of the reproduced plates, seem to be unnecessary, while the long list of mottoes is the merest padding.

We regret that we cannot bestow higher praise upon a book which has very considerable merit; but in the interest of good literary work it seems necessary to protest against all attempts to make bulk take the place of careful and judicious research.

Six Dialogues of Lucian. Translated into English, with an introduction, by Sidney T. Irwin, M.A. London: Methuen & Co. 1894.

THERE are certain authors so ill-adapted for solitary study that the reader must for ever be looking up from his book for a friend to share his ecstasy. The student of Lucian seems to fall into this habit until there is nothing for him but to make a translation that shall give his non-classical friends the clue to his delight. Mr. Irwin has made the latest English contribution to this literature of love, and prefaced it by a pleasantly written introduction containing the usual apology, in the spirit of a man exhibiting his lady-love's portrait, and anxiously explaining that, lovely as it is, it does not do her justice. Although the present example is accurate and more vivacious than the average translation of a witty author, it still lays bare the fact, veiled to a certain extent for scholars by the inevitable charm of the original language, that Lucian was capable now and then of writing as dully as another.

Mr. Irwin makes no pretence of contributing to scholarship in the present book, and no one will quarrel with him for treating his Lucian as nearly as possible like a modern author. But Arnold and Pater have accustomed the reader of English classical essays to feel the iron of science under the velvet of style, and to enjoy himself in security. Mr. Irwin glides over some difficult questions with a confidence that makes one doubt his realization of the *ignes suppositos*, and does not seem to have given great heed to modern Lucianic authorities, although he does admit an appeal from Müller and Donaldson. Again, the note on Lucian's abstention from allusion to Rome and Roman writers would not have been written by a student of general Greek literature in the second Christian century, for such a student knows that the Empire and all its works were avoided by the Sophists with a delicacy equal to that of Mr. Wegg. But the book is useful as setting before the public some of the less read of Lucian's works, and it is cheering as a

token of the growing interest in this great writer among English-speaking scholars. Lucian's temperament is one with which the German genius is particularly unfit to deal. It blunders by taking him seriously—not when he jokes, for his humor is generally writ too large for misconception—but when he is serious. Mr. Irwin is right in treating the Dialogues of the Gods as so much pure literature, with no missionary motive behind them.

But in delivering us from the rehabilitated Lucian of the Germans, English scholars have foisted on us another delusion. Pater, whose delightful use of a fragment of the 'Hermotimus' in 'Marius' is largely responsible for Lucian's vogue, imposed him on the popular mind as a gentleman. The 'Hermotimus' had to be considerably assisted in bearing out this view, but, when all was done, Lucian emerged from Pater's refinery with the hall-mark of an Oxford man. Mr. Irwin has adopted this pleasing fancy, though with misgivings. It is an ungracious task to remind his readers that Lucian's ugly method of personal abuse, his vanity and his callousness, do not need the help of his indecency to bar him out from the little band of ancient gentlemen that stand beside Plato and Pliny the Younger.

Occult Japan. By Percival Lowell. Boston: Houghton, Mifflin & Co. 1894.

THIS work describes a distinct "find" by its brilliant author during a recent sojourn in Japan, viz., of an elaborate system of possession-trance practised by one of the sects of Shinto, the ethnic faith of Japan. Introductory or sequent to this main theme are accounts of Shinto miracles, pilgrimages, "gohei," and the Ise shrines. Last comes an analysis of the possession-trance and its congeners, hypnotic-trance and dreams, from the standpoint of monism and in the light of the most recent psychologic research. It appears that the peculiar impersonality of the Japanese race, previously treated by Mr. Lowell in his 'Soul of the Far East,' renders it specially capable of that discarding of all positive thought-content which forms the *sine qua non* of trance, whether possessory or hypnotic. While the latter is unknown in Japan, the former is surprisingly common, at any rate around Tokyo. In it the control is not, as in Western spiritualism, the spirit of a deceased person, but one of the myriad Shinto deities, who consents to answer through a medium—*nakaza*—the questions of an official interrogator—*maeza*—concerning "anything a man may want to know, from the nature of the gods themselves to the weather of the coming month." Much care was rightly bestowed upon tracing this curious cult to its real source, the primitive Shinto faith as distinguished from the imported Buddhism, and thus a distinct contribution has been made to what is at last receiving deserved attention, the ethnic faith of Japan.

The treatise stands a model of keen observation, deep insight, and scientific analysis, while over all this rigidly scientific material and method is thrown the charm of a style that implies the blending of scientist and poet. The abounding satire, epigram, alliteration, and metaphor would as much repay a perusal with purpose of entertainment, as its soberer merits would for instruction in an absolutely new field.

BOOKS OF THE WEEK.

A Winter's Tale. King John. 2 vols. [The Temple Shakspere.] London: Dent; New York: Macmillan. Each 45 cents.
Burgwyn, C. P. E. The Lost Diamond: A Play. Richmond, Va.: J. W. Randolph & Co. 15 cents.
Charles, R. H. The Ethiopic Version of the Hebrew Book of Jubilees. Oxford: Clarendon Press; New York: Macmillan.
Davidson, John. Ballads and Songs. London: John Lane; Boston: Copeland & Day. $1 50.
Edgren, Prof. A. H. Shakuntala; or, The Recovered Ring. Henry Holt & Co. $1.50.
Flint, Prof. Robert. Socialism. London: Isbister & Co.; Philadelphia: J. B. Lippincott Co. $3.25.

NOW READY
Dr. Parkhurst's Book
Our Fight with Tammany

By Rev. CHARLES H. PARKHURST, D.D.
12mo, $1.25.

CONTENTS

Society for the Prevention of Crime—Madison Square Pulpit's Analysis of Tammany Hall—Discourse of February 14 Reviewed and Reviled—Rebuked by the Grand Jury—Collecting Evidence—Affidavits in the Pulpit—Presentments by the Grand Jury Against the Police Department—Byrnes and the Great Shake-up—On the Rack—Mass-Meeting at Cooper Union—The Pulpit and Politics—Gardiner's Arrest and Trial—The Social Evil—Byrnes's Effort to Discredit the Crusade—First Attack on Devery—Denunciation and Whitewash—The Broome Street Mob—War on the Captains—The Chamber of Commerce Appeals to Albany—The Committee of Seventy—Election Appeal from the Madison Square Pulpit—Victory: Its Perils and Opportunities.

Dr. Parkhurst's book is a stirring story of the crusade against the Police Department and Tammany Hall, and is written in the author's characteristically uncompromising style, presenting a detailed account of the progressive steps which resulted in the Lexow investigation, police convictions, and the defeat of Tammany Hall at the polls.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 7, 1895.

The Week.

THE House is to vote on the Springer bill to-day. Should the bill pass, the Senate must act or refuse to act. The necessities of the Treasury, however, are immediate. The public were in a state of alarm on Wednesday week. A great deal of gold was drawn out under the influence of panic. If the banks had not stood firm, and refused either to draw gold from the Treasury for their customers or to receive special deposits of gold, we should have had a general panic, under the influence of which the Treasury would have lost every dollar of gold that it held, as rapidly as it could be drawn out. The negotiation for a $100,000,000 loan abroad has had a quieting effect, and for this President Cleveland is again entitled to the thanks of the business community and of the whole community. His services in this emergency have been no less than they were in the matter of the Sherman repeal bill.

In the Senate debate the question was raised whether there was any power to use the proceeds of bond sales to meet the current expenses of the Government. This is not a new question, nor is the answer to it new. After a greenback has been redeemed in gold, it does not cease to exist, since there is an express law which provides that it shall be paid out again. There is no way to pay it out except for Government expenses or for redeeming the public debt. Of course, the expenses must be paid before the debt is redeemed. This is merely saying that, with a given sum of money in the Treasury, the Government's present obligations must be paid rather than its future ones. Thus it comes to pass that while bonds can be sold only for the purpose of redeeming legal-tender notes, and while the gold received for bonds is used only for that purpose, the practical operation is the employment of the money to meet a deficiency of current revenues. It is true that this was not contemplated by Congress when the bonds were authorized, but neither was a Treasury deficit contemplated. The intention was to make specie payments effective and permanent; and while no such emergency as the present was then anticipated, the wisdom of that clause in the specie-resumption act has now been vindicated in a signal manner.

Whatever may be the true theory of the origin of the Treasury's troubles, it is as clear as a sum in simple arithmetic that the Government's present embarrassment is, in Mr. Wilson's phrase, as a banker, not as a paymaster. On January 31 there was a net cash balance in the Treasury of $99,897,337. That sum is enough to pay the running expenses of the Government for three months, even if not a penny of revenue came in. To be entirely fair, and leave out of consideration the subsidiary coin ($15,481,586), the Treasury has more than $80,000,000 in hand—seven times as much as Foster had in hand when the Republican era of great prosperity closed two years ago, and ample to meet every demand liability which can be presented to the Government as a paymaster for two months to come. But the Government is unfortunate enough to be a banker as well, and has outstanding something like $500,000,000 in notes which it is bound to redeem in gold, on presentation. But, alack! of gold to redeem them in it has but $44,000,000, and it is evident that it could be bankrupted to-morrow as a banker while remaining perfectly solvent as a paymaster. Salaries, supplies, interest—it can meet them all with cash payments and have plenty left; but the greenbacks and Treasury notes are all the while making their deadly round and threatening instant collapse of the whole fabric of the currency. Yet the *Tribune* says the greenbacks are the kind of money the people "like," and that nobody must lift a finger to get rid of them; so what are we to do?

When the House of Representatives fixed a time for taking a vote on the Pacific Railroad bill against the protests of the opponents of the measure, it was generally supposed that the same vote would be cast for the bill itself. It has turned out differently, the bill having been defeated by a large majority. Technically the bill is merely recommitted without instructions, but in the present state of the public business it might as well have been killed outright. There is no chance of its coming up again at this session. If a special session of the new Congress is called directly after the expiration of the present one, it will still be possible to save the Government's claim or the greater part of it; but if the next Congress should prove as impotent to deal with the question as this one, the whole will be lost. A crisis has been reached where non-action means foreclosure of the prior lien. The Government has no more rights than any other second-mortgage bondholder, and there is no more reason why the courts should postpone a sale under the first mortgage than in a case where private parties only are concerned. Indeed, there are some reasons why less delay should be granted. Usually the holders of junior securities come into court and plead that they have been taken by surprise, that they need time to collect the securities and take counsel together, and that they ought not to be called to a sudden determination of their rights and interests. Nothing of this kind can be said for the Government. It has had this matter under debate more than ten years, and when delay was no longer possible it has refused to take any action whatever. It is true that the Government can come in, at a sale under the first mortgage, and redeem the property from that lien, but to do so requires an act of Congress which we shall not get from this Congress and ought not to get from any, since the main line without the branches is not worth the first mortgage.

Why, it may be asked, does the House vote against its proper organ, the committee on Pacific railroads? The debate during the three days set apart for it shows that the most moving consideration was the sins of people who are mostly dead, and who, even if they were alive, could not be compelled to disgorge their ill-gotten gains. "If we pass this bill," said Mr. Snodgrass of Tennessee, "we shall condone all the frauds, all the crimes, all the thefts, all the robberies that these directors and stockholders have committed against the Government of the United States and the people of this country, and besides we shall continue to give them an additional subsidy for fifty years more." And rather than give them what is called an additional subsidy we will now hand over to them our entire claim and preserve our consistency. True, we shall not prosecute anybody for these frauds, crimes, thefts, and robberies long past, whether the perpetrators be alive or dead, but we shall preserve our consistency at the expense of $116,000,000. It is needless to say that such a course would not be pursued by any private creditor.

Congress having thrown over its shoulder the sum of $116,000,000, by voting against the Pacific Railway funding bill, may have a chance to reject $75,000,000 which, it is understood, will be offered as a lump sum for the Government's claim on all the subsidized roads. It is proposed to attach an amendment of this kind to one of the appropriation bills as a last chance to get anything. The original issue of bonds in aid of these roads was $64,000,000, upon which interest has been paid to the amount of $102,000,000. The roads have repaid $50,000,000 by transportation and sinking-funds, leaving the balance of debt mentioned above. If an offer of $75,000,000 is made now for the Government's claim in full, it ought to be accepted instantly. That sum would meet all the maturing bonds known as the "currency 6s," and leave a margin of nearly $11,000,000 to be applied on the back-interest account.

The introduction in the Senate of a bill to retire Justice Jackson of the United States Supreme Court upon a pension, although he has served only two of the ten years ordinarily required, is interpreted as meaning that there is no hope of his rendering further service upon the bench, owing to his impaired health. The appointment of a Democrat as his successor will involve no change in the division of the judges between the two parties, as Jackson, although appointed by Harrison near the end of his administration, to succeed Lamar, is a Democrat. With the retirement of Jackson there will be only three of the nine members of the bench whose appointment dates back of 1888, and one of these three, Field, will before long be compelled to abandon his post by the increasing infirmities of old age. But if Cleveland should appoint his successor, it would make no change in the party division, as Field, although appointed by Lincoln in 1863, is a Democrat. There are now five Democrats and four Republicans on this bench, but it would puzzle anybody to tell with which party a judge sympathized from anything in his decisions.

The leading architects of the land, who have been working with patriotic zeal and disinterestedness to get a law passed by Congress which should put the office of supervising architect upon a basis that would enable it to command the best architectural talent of the country in the construction of public buildings, have discovered that somebody at Washington has suddenly thwarted their plans. Mr. Carrère, who declined Secretary Carlisle's offer of the position of supervising architect a few days ago, says the general impression among the architects and others interested in the proposed reform is that Logan Carlisle, son of the secretary, is the man who has blocked the movement. It has been known for a long time that the secretary's son was his "wicked partner" in the administration of the Treasury Department. No matter how virtuous may be the father's professions in regard to civil-service regulations, architectural or other reforms, if Logan takes a different view, the professions go to the wall. Logan is an enthusiastic spoilsman of the old school, and delights in nothing so much as snubbing reformers and blasting their hopes. His presence in the Treasury Department has been a constant scandal since his first appearance there. That he should be able to upset so desirable a reform as the adoption of a new and workable system for the supervising architect's office, a system which had been drawn up to meet and had met the approval both of the secretary and the assistant secretary, shows that he is a power for harm which ought to be destroyed even if it requires Presidential authority to rid the Treasury of the further scandal of his connection with it.

Poor, ignorant Gresham goes on his blundering way, getting one troublesome international question after another settled in the most stupid fashion. His Japanese treaty, for not negotiating which, and then for negotiating which, he was so justly denounced and exposed by the *Tribune*, has just been ratified by the Senate. Prior to that his Chinese treaty, covering so many points of international difficulty, was negotiated and ratified. In between came his dealings with Great Britain, resulting in the final abandonment of the English protectorate over the Mosquito Coast—a protectorate which had bothered all the really great minds in the State Department since Marcy's day, only to be disposed of for ever by an ignoramus. These three great achievements in two years by the most imbecile secretary that ever dismissed a subordinate and forced him to write for the *Tribune*, show us what might have been done in the same time by a man of average ability. One has to go back to the days of Hamilton Fish to find a parallel to what this laughing-stock of the nation has accomplished. It would add much to the general hilarity over his colossal and criminal blundering if he should succeed, in the next two years, in negotiating a treaty of arbitration with the European powers. That would complete and round out the career of a dunderhead in a way to make it wholly unique.

The Democratic managers in Tennessee seem bent upon carrying through their scheme for keeping the governorship from the Republican who received a majority of the votes on the face of the returns at the November election. Although the Constitution requires the turning over of the office to the man whose election is shown by the returns, and although it has been the invariable custom to follow this rule, the fact that the margin in favor of Evans, the Republican candidate, was very narrow has been too strong a temptation for the dominant ring, and the Democratic Legislature sustains Gov. Turney in the claim that he can hold over, pending a contest, the result of which is a foregone conclusion. It is encouraging to note that there are earnest protests from leading Democrats against this policy. A number of the most prominent party journals have opposed the scheme, and the editors evidently find abundant support among their readers. One of these newspapers, the Nashville *Banner*, publishes a very forcible letter against the conspiracy from Mr. John S. Bransford, a veteran Democrat, who makes an eloquent appeal to the young men of the party to arise in their strength and force the usurpers to yield. The *Banner* declares its conviction that "the overwhelming majority of Democrats oppose the revolutionary and indefensible policy pushed by a partisan lobby in the Legislature," and it calls upon the people to make this opposition effective by letting members of the Legislature know their sentiments and demanding that the law-makers do their duty. It seems doubtful, however, whether the scheme can now be blocked. If it is carried out, it is altogether probable that the revolt of honest Democrats against the management of their party will give the Republicans a majority too large to be tampered with in 1896.

The effect of office in raising a man's opinion of himself has often been curiously illustrated in this city, where we have frequently seen an unknown person, drawn from the liquor shop or the petty clerkship, and converted into a "commissioner," suddenly begin to give tongue on taxation, or rapid transit, or "the wealth of New York," or other great public interests with all the authority of a Turgot or a Hamilton. But the working of the principle was probably never more curiously illustrated than in the case of Mr. Lexow. He was and is a comparatively young and quite unknown lawyer, who got elected to the State Senate from the village of Nyack, and was, we presume by Mr. T. C. Platt's suggestion, put on the committee to investigate the police of New York. This committee at the outset was certainly not intended, or, at all events, not expected, to do anything of consequence, and when it came down here very few people in New York had ever heard of Mr. Lexow. The work before the committee was done by Mr. Goff, and Mr. Lexow simply sat still and listened. But no sooner was it all over, and no sooner had the committee made a rather silly report, than the citizens of New York found that they had got, in the person of this obscure lawyer, a real master, who knew what was good for them better than they knew themselves, and disposed of men like Mayor Strong, James C. Carter, Dr. Parkhurst, Mr. Charles S. Smith, and Mr. Larocque, and the like, with contempt as a "gang of reformers," of whom he was "sick and tired." For mass-meetings got up by them to express the opinion of those who won the election on his bills he expressed similar scorn. But the most diverting of his utterances appeared in the *Tribune* on Sunday. Said he:

> "I have personally felt the pulse of public sentiment during the last fortnight, speaking with all kinds of men, who represent every shade of feeling, and I have found the opinion in favor of a bi-partisan Police Board to be overwhelming."

Of course the only pulse he could feel "personally" is that of T. C. Platt. Nobody else of any weight would let such an absurd body get near him, least of all "public sentiment." When he talks of "public sentiment" he must mean that of Nyack, where, we have no doubt, he is a very big man; but why should the public sentiment of Nyack govern New York? and why should its great men take the place of our great men?

Gov. Morton, not being so great a man as Lexow of Nyack, is not able to share the latter's contempt for criticism, mass-meetings, and "gangs of reformers." He looked forward with so little pleasure to the prospect of being grouped with Platt and Lexow in the protests which the citizens of New York were to make in mass-meeting on Monday evening, that he sent for Lexow on Friday, and told him he must so amend one of his police bills as to give Mayor Strong the power to appoint the commission to reorganize the force, since he (the Governor) would not sign the bill if the appointing power were given to himself. As this was the point in the bill upon which Lexow had refused to yield a few days earlier, and in refusing had expressed his contempt for criticisms and mass-meetings, the Governor's demand was a hard blow to the great Senator; but Platt gave him orders to yield to it, and he did so as gracefully as possible. It should be said of the Governor that he has merely put in execution the purpose which he announced soon after the bill was introduced by Platt through Lexow. He was quick to see that Platt, in preferring him to Mayor Strong as the appointing power, not only violated the spirit of the Constitution, but held up the Governor before the people of the State as a more pliable Platt man than the mayor.

The anti-Platt meeting on Monday night was one of the most enthusiastic, one of the largest, and, as regards composition, one of the most thoughtful and intelligent, that have ever met in the Cooper Union, and the oratory was worthy of the meeting. Gen. Swayne's definition of the relation of party to good government was as effective a bit of political moralizing as has ever been heard on a platform; and Mr. Carter's description of the Lexow attempts at legislation as "the boldest, the most impudent, and the most inexcusable piece of audacity in proposed legislation ever made known in the city of New York, which has seen many instances which would almost come up to it," brought down the house. Dr. Parkhurst was never in happier vein, and must have recalled to many present the great days of Henry Ward Beecher, who was, at his best, undoubtedly the most telling political orator of the last generation, and, unless it be Dr. Parkhurst, has certainly no successor. When one, in listening to these orators, and looking at the meeting, remembered how much it represented of the intelligence, public spirit, and patriotism of New York city, how much of its trade, commerce, industry, and good citizenship, and by what great popular majorities its position about city government had been backed up at the polls, one could not help marvelling at the audacity and impudence, in Mr. Carter's words, of the opposition got up by Platt with his handful of obscure, uninfluential, and insignificant followers. Platt against the city of New York, Lexow against 154,000 city voters, "Lou" Payn against the bar, Fish against the clergy, Fred Gibbs against the Chamber of Commerce, "Jake" Patterson against the Good Government clubs—sounds surely like a very unequal fight.

Gov. Morton's approval of the acts of the former State Civil-Service Board, placing all the employees of the State Department of Public Works under civil-service regulations, is causing deep pain to Platt's new head of the department, Mr. Aldridge of Rochester. The latter finds it very difficult to make a "clean sweep," with these regulations in force, for the present employees refuse to resign, and he is unable to find sufficient reasons for removing them. Nothing is so exasperating in the Governor as his tendency "to pander to the moral sentiment of the community," and Platt will be goaded into taking violent measures against him before long unless he develops more hardihood on the subject of public opinion. It is most irritating to have the Governor consent to place a Platt worker like Aldridge in office, and then place the office under regulations which make it impossible to use it in the interest of Platt politics.

The real trouble with the Governor lies in the fact that he is himself a citizen of New York city. He has spent many years of his life here, has held an honorable and influential position in its social and business circles, and knows decent public sentiment when he sees it. When he comes to this city he associates with the very people who make that sentiment, and he is the first Governor that we have had for many years of whom this can be said. When Hill came here while he was Governor, he met nobody except Croker, Gilroy, Grant, and the Tammany gang. He seldom went into a respectable private house, or had any intercourse with the respectable elements of the city population. The same thing was true to a great extent of Gov. Flower. Platt made a great blunder in not favoring the nomination of somebody from the rural districts, and we have no doubt that he sees his mistake now. He and Lexow and the rest of the Platt faction despise decent sentiment without much personal discomfort, because they seldom or never come in contact with it. That is what makes Lexow's statement that he has "personally felt the pulse of public sentiment" so delightfully ridiculous.

President Eliot's characterization of intercollegiate football, in his annual report, is the utterance of a man who refuses to surrender either his reason or his responsibility to a popular and passing craze. Out of the mouths of the apologists for the game, he condemns it. They would restrain on the day of the great match the brute instincts which they have been sedulously cultivating through three months of training, by "employing more men to watch the players," so as to prevent foul and vicious playing. What sane man can dispute President Eliot's conclusion, that "a game which needs to be so watched is not fit for genuine sportsmen"? Nor will it be any easier for men whose livelihood or fame or animal gratifications do not depend upon the game, to disagree with his verdict that it is "unfit for college use." In this he speaks as the educator, mindful of his duty to the young men under his care and to their parents; farther on he speaks as an American citizen who would not see the intellectual and moral standards of his countrymen turned topsy-turvy. The justice and the pungency of the following sentences it would be hard to overestimate:

> "It should be distinctly understood, however, that the players themselves have little real responsibility for the evils of the game. They are swayed by a tyrannical public opinion—partly ignorant and partly barbarous—to the formation of which graduates and undergraduates, fathers, mothers and sisters, leaders of society, and the veriest gamblers and rowdies all contribute. The state of mind of the spectators at a hard-fought football match at Springfield, New York, or Philadelphia cannot but suggest the query how far these assemblages differ at heart from the throngs which enjoy the prize-fight, cock-fight, or bull-fight, or which in other centuries delighted in the sports of the Roman arena."

The London *Statist* has an interesting though conjectural estimate of the amount of British capital invested outside Great Britain. Last year the value of the imports into the United Kingdom exceeded the value of the exports by £134,000,000. The British vessels entering and clearing with cargoes during the year measured about 50,000,000 tons, which at 10s. per ton would represent earnings of £25,000,000; to this should be added the earnings of English ships which did not touch at English ports; also the commissions and insurances, amounting in all to £40,000,000. The foreign and colonial borrowings during the year amounted to £30,000,000, while advance orders for machinery, etc., would account for £6,000,000 more. Adding £36,000,000 to the £134,000,000 excess of imports and deducting the £40,000,000 referring to the shipping, we have as a remainder £130,000,000. Large amounts of capital invested abroad were brought home to London, but these withdrawals were offset, the writer thinks, by the interest which became due in 1894, but which the English capitalists did not receive, because of default. Next, the net imports of coin and bullion of all kinds amounted to £10,000,000, making the total assumed receipts on capital invested abroad £140,000,000. Capitalized at 5 per cent. this sum would represent an investment of British capital outside Great Britain amounting to nearly 3,000 millions sterling, or fifteen billions of dollars, which probably understates the real amount.

"REASONABLE WAGES."

MR. CARROLL D. WRIGHT has an article in the current number of the *Forum* on "Steps towards Government Control of Railroads," in which he maintains that the bill now pending in Congress, providing that railroads shall pay "just and reasonable wages" to their employees, and providing for the submission of all differences between them to "a properly constituted tribunal," is a step, though a subordinate one, in "the silent revolution now going on," which is finally to place the Government in control of the railroads. The principal step is the pooling bill, which provides that charges to shippers shall be reasonable. The former bill, he declares, will make railroad employees "quasi-public servants"; and "though as a rule he would not allow the Government to fix the wages of railroad employees," nevertheless he holds that, "inasmuch as it is its right and duty to prevent the interruption of interstate commerce and the obstruction of the mails," in the exercise of this right it "ought to have a voice in making terms and adjusting the conditions of the employment of employees engaged in such service." Curiously enough, too, he declares that the Chicago strike, which did not arise out of a dispute between railroads and their employees at all, "must be recognized as a factor in producing the changes in the federal law now going on," for it "is dissipating a good deal of the haze which has hung before the eyes of both labor and capital." He also maintains that such Government interference on behalf of railroad labor would be a parallel to the Government interference, through the pooling and interstate commerce bill, on behalf of merchants and shippers.

Now, it is not a little singular that so acute a man as Mr. Wright should not perceive the radical difference between Government interference on behalf of shippers and Government interference on behalf of labor, which lies in the fact that in the one case the Government controls, or can control, both parties, and in the other it controls only one. It can make the shippers pay whatever the railroads charge, because the railroads furnish their only means of transportation, and it can make the railroads charge only reasonable rates, because it can punish the officers or remove them for disobedience. But although it may compel the railroads to pay "reasonable wages," it cannot compel the employees to consider them reasonable, or to accept them. In spite of Mr. Wright's experience with the Chicago strike, there is one bit of haze it has not removed from his mind. He is still, apparently, under the impression that laborers would not or could not strike if a Government tribunal said the wages were reasonable, or that in any dispute with the corporations labor was in the wrong. If the Government decided against labor, it would have no power whatever to enforce its decisions or make the men work on terms prescribed by it; and if they refused to abide by its decisions, as they undoubtedly frequently would, it would have to keep the roads open by military force, just as it did last summer, and let the railroads get new labor as best they could. Never was there an odder hallucination than the notion that laborers would not strike if they were called "quasi-public servants." They would strike under that appellation just as readily as under their present one, whenever they wanted something which "the properly constituted tribunal" refused to give them. Where the Chicago strike was illuminating was in showing the length to which "organized labor" is prepared to go in asserting its own claims against the rest of the community; for in that case the railroads of the country were blocked, and the mails interrupted, in order to compel a private carriage-builder in one State to make concessions to his employees which he said he could not afford. In that strike no special reverence was shown for "Government," any more than for any other power. It was treated like any other "foe of labor," *i. e.*, like anybody else who said the demands of labor were unreasonable.

Moreover, all interference of Government between railroads and their employees would necessarily be the interference of politicians between a large body of voters and a small body of property-holders. Anybody who supposes that under these circumstances the large body of voters would not generally get the best of the controversy, is not familiar with the history of labor strikes in this country. It may be laid down as a general rule that nobody is so competent to define the term "reasonable wages" as the persons who are to pay them, acting in concert with the persons who are to receive them. What is reasonable wages in any particular business depends partly on the cost of production and partly on the state of the market. No outsider could know much as to the effect of either of these agencies on the rate, even if he were not a politician or a man with a "political future." A permanent tribunal for fixing the rate of wages would, therefore, either have to consist of representatives of the parties to the bargain or of incompetents. As a representative of the Government it would be a ridiculous body. In considering it, too, we have to take into account the present labor notion of reasonableness. The general notion of labor to-day is that it is entitled to all profits, and ought not to be asked to pay anything for superintendence. It thinks the unions could run the roads under the supervision of a grand master-workman. What Mr. Wright and those who agree with him should favor, if they wish to deal fairly with the property-holders, is the purchase of the railroads at a fair valuation. It is only as Government property that Government can manage them at all, and as such they would probably be run, like the post-office, without reference to profits, and the taxpayers would make wages "reasonable."

Mr. Wright and many other good people are trying to make legislation and governmental machinery supply the place of knowledge, good sense, and self-control on the part of the class of the community from which railroad employees are taken. This class is at present governed almost absolutely by very ignorant and unprincipled leaders, to whom disputes with employers are useful, as tending to magnify their office and display their power, and exalt what is called the laboring class as against the rest of the community. Men like Debs are "tickled to death" by being able to block the national highways, and suspend business, and compel the Government to treat with them, or inquire into them, on a footing of equality. The proposed legislation, of which Mr. Wright approves, would not diminish the importance of this class one iota. On the contrary, it would increase it. The countenance given by such articles as Mr. Wright's to the assumption that in blocking the highways of a great nation in order to make Pullman arbitrate, Debs was more than half right, and was removing "haze from the public mind," impedes the process of education by which alone the labor problem can be solved.

A USEFUL DEMONSTRATION.

COL. WARING has been at the head of the Street-Cleaning Department for a little more than three weeks, yet in that short time he has forced from even Tammany critics the concession that the streets of the city have been cleaned as they have not been cleaned before in the memory of the present generation. He has had several snow-storms to contend with, and has grappled with them in a manner to astonish the oldest inhabitant. The snow has disappeared from the principal streets and avenues of the city in a manner which, after our experience with Brennan and Andrews, has seemed positively miraculous. Citizens have been astonished on waking in the morning to find that the snow which filled the streets in front of their houses at nightfall had vanished in the night. The unfamiliar spectacle of gangs of able-bodied sweepers and shovellers really working like other laboring men, while a boss stood over them directing and prodding them, has caused the casual wayfarer to pause and ask himself if his eyes were not deceiving him. Nothing of the kind had ever been seen by him before. He had been familiar with the gangs of infirm and decrepit creatures, never seen anywhere else save on park benches, who held brooms and shovels for no other purpose than to lean upon them and discuss questions of politics and government. The new gangs are made up, apparently, of less thoughtful men, but they do more street-cleaning, and their advent is one of the wonders of the period.

And how has this wonder been accomplished? Simply by treating the question of cleaning the streets as a plain business matter, to be met and executed by business methods. Col. Waring has done nothing more than put "politics" out of the department. Instead of asking an applicant what his "pull" was, before "putting him on a broom," he has inquired into his capacity to work. He gave away the secret of his method when he said, in response to a critic who had spoken of the "positions within his gift" as commissioner, "There are no positions in my 'gift.' No position in the department is going to be given away to anybody; a full equivalent in work will be returned for it." By following out this principle in all branches of his department Col. Waring has succeeded in a fortnight's time in so reorganizing his force that it is really cleaning the city. Could anything be simpler than the means by which this wonder has been accomplished? It has not cost a penny more than the old method of not cleaning the streets cost. On the contrary, we believe it is a fact that the colonel finds the appropriation ample for not only cleaning the streets but keeping them clean.

Yet when Col. Waring's appointment was first announced, the city was fairly crowded with wiseacres who were wagging their heads over his foredoomed failure. They were absolutely sure that he could not succeed. Why? Oh, because nobody except a visionary reformer or dreaming mugwump believed that the streets of New York could be thoroughly cleaned. Were not the streets of other great cities of the world kept clean? Possibly they were, but there was something peculiar about the streets of New York. The pavements were different from those of other cities, and then look at the trucks: no other city allowed trucks to be stabled in the streets. Was not there a law against such stabling? Possibly, but you could not enforce it, you know. Could not the trucks be moved or the pavement under them be swept by a competent force? Ah, there you hit the point. You could never get in New York a competent force. Why? Because you could never quite remove the department from politics, and even if you could you would still be unable to get such a class of men as they have abroad. Finally, you must remember that we are living in America, not Europe, and must take things as we find them.

This state of mind, and it was as general as it was tiresome, was the result of years of contemplation of political street-cleaning. The task which had never been surmounted came to be looked upon as insurmountable. While boasting ourselves to be the most indomitable and ingenious people on the face of the earth, we were willing to confess that the cleaning of our streets was a problem of such superhuman difficulty that we must give it up. The daily spectacle of private contractors cleaning separate blocks and groups of blocks perfectly, did not shake this doubt of our capacity. Cleaning the whole city was merely applying to every block the simple methods which succeeded in a single block, but we quailed before such a tremendous generalization, and said no, it is too much to expect of us; it cannot be done, and if you were not a thoroughly impracticable person—a theorist, in fact—you would see it could not be done. Well, it has been done, and by a theorist, too.

Col. Waring has conferred an unspeakable boon upon the community by shutting off this refrain from the chorus of "well-nows" who are always sure that, however useful plain common sense may be in other matters, it is utterly useless in politics. He said at the outset that cleaning streets seemed to him to be, after all, only a human operation, requiring no supernatural powers for its success, and he has demonstrated as much. He was the first appointee of Mayor Strong on the platform of non-partisan, business administration of municipal government, and his success shows the practical wisdom of that platform. For the first time in a quarter of a century at least, the experiment has been made of running a great municipal department, with a large force of men, on business principles and without political interference, and the result has been that a task which was given up as insurmountable under twenty or thirty years of political administration has been accomplished triumphantly within three weeks. That is an achievement which ought to close the mouths of the "well-nows" for all time.

There is something more in this triumph of common sense than a defeat of "practical politics." Col. Waring well says that the true measure of the health of a community is not its death-rate, but the health-rate; that there may be a vast amount of sickness and of costly disability with a very low death-rate, but that a high health-rate is an unfailing index of good sanitary conditions and insures a low death-rate as a matter of course. His cleaning of the streets does not stop, as Tammany's did, short of the tenement-house districts. He cleans the whole city, and in so doing brings one part of our municipal administration to the level of civilization for the first time in many years. Nothing could do more for the health of the whole city than this, and nothing carry more happiness to the homes of the poor. We are at last doing our simplest duty to the most helpless portion of our population in one direction, and the example should be followed in all others. Honest and economical administration should follow clean and healthy streets, in order that the burden of living may be made as easy as possible for the poor. This can be done if Mayor Strong is given the power to fill every municipal office with men of the Waring type, who will apply the same common-sense methods to all branches of the city service. The mayor is ready to do this, but Boss Platt refuses to give him the power. Let us send Platt about his business, and usher in the full era of common sense in city government.

ORDER OUT OF CHAOS.

If you want a thing done, says the proverb, do it yourself. Acting on this principle, Mr. John G. Ames, the accomplished superintendent of documents, Department of the Interior, has produced a 'Comprehensive Index of the Publications of the United States Government, 1889-1893.' "I have repeatedly urged that provision be made by Congress," he says in his letter of submittal to the secretary of the interior, "for the preparation of such an index, not only of documents yet to be printed, but also of those already published. As Congress, however, failed from session to session to make such provision, I took upon myself, about three years ago, the task, additional to the current and prescribed work of my office, of preparing an index of the documents issued during the period covered by the Fifty-first and Fifty-second Congresses." Mr. Ames's chief, Secretary Hoke Smith, proved not unappreciative of this disinterested labor, giving it, along with his imprimatur, his "hearty commendation," and the assurance that "it will be welcomed as a most acceptable contribution to this class of literature by members of Congress, by officers of the Government, and by the public at large."

Time will show whether the average congressman, whose imagination was too feeble to make the mere mention of such an index secure his vote for it, as for a measure of public utility and even necessity, will appreciate the work now that it is done, and will order its continuance by a regular force. No intelligent person, in or out of Congress, can examine Mr. Ames's Index without blessing him for it, and seeing in it a help to consistent and thoroughly informed legislation and much else besides. For one thing, it makes the public document no longer lumber in our public libraries, but a part of the general circulation. Consider only that it renders our consular reports available, and that it must react on these favorably by encouraging consuls to put forth their best endeavors for a better destination than the waste-basket. All these reports are entered topically, and possess often a curious if not always an immediately practical interest. Consul Wildman, for example, at Singapore, defines the local disease called *beriberi*, noting its symptoms and treatment. Consul Griffin, at Sydney, treats of the rabbit pest in Australasia. Similar domestic topics are the ramie industry in America, and the introduction of the *Icerya purchasi* and its parasites into California. Indeed, there is hardly any subject which we need be surprised to meet with, since important papers in the

publications of the Smithsonian Institution, the National Museum, the American Historical Association, etc., are entered. Thus, we find slavery in the Territories discussed by the late President Welling, bibliographical notes on Eliot's Indian Bible, by J. C. Pilling, a history of the Sutro tunnel, accounts of lumpy jaw in cattle and of smokeless powder, a recommendation that the slums of cities be investigated by the Commissioner of Labor, a resolution looking to the better ventilation of the dining-room of the House of Representatives, etc., etc.

The political history of the period is, of course, accurately reflected in this Index. Silver and the silver-pool investigation, lotteries, the eight-hour law, the Homestead troubles, the Chilian imbroglio, Chinese immigration, the movement to elect Senators by the people, the World's Columbian Exposition, the experiments to control rainfall, the International American Conference — such are a few of the more conspicuous rubrics. Each department of the Government naturally has its separate list of publications displayed, as have its bureaus and functions —lighthouses, fish and fisheries, and the rest. To be remarked especially are the long lists of findings by the Court of Claims and cases referred to it (more than seven pages of names altogether); of pensions recommended (thirteen pages in double columns); of public buildings recommended (a page and more); of bridges recommended to be authorized; of recommended corrections in the military record (two and and a half pages of names); of public documents recommended to be printed. Every name, personal or geographical, in these lists is entered again in the general alphabet. Finally, the writers of papers, the authors of consular reports, the Senators and Representatives who report for committees, the cabinet officers and heads of bureaus, are all grouped in a Personal Index, which completes the serviceability of this admirable key.

Mr. Ames's conception of his Index, which we wish we could describe in his own words, seems to us very just, and the execution of it as nearly perfect as could be expected. Every journalist ought to desire to possess, and every library ought to be supplied with, this volume—a quarto of less than 500 pages—which should be the first of a series carried punctually forward from year to year, or from Congress to Congress, or in four-year periods, as the best judgment of experts may determine, and also gradually extended backwards. The present compiler's endeavors to regulate the shocking waste in the distribution of public documents are well known. With the new value given to them by this Index, it ought to be possible to establish once for all a system of exchange and sale which should greatly reduce the expenditure for public printing. The new Public Documents bill will do much to prevent reduplication of documents. Many, says Mr. Ames, "are published as Executive or miscellaneous documents of the Senate or House of Representatives; again, in a different style of binding and with a different title, as reports or publications of an Executive department; and again, with still another title, as reports of a particular bureau or office of the department." Meantime, this medley is threaded by his Index, for which, in closing, we join our thanks to those of the secretary of the interior.

MR. ABBEY'S DECORATIONS FOR THE BOSTON LIBRARY.

LONDON, January 19, 1895.

THERE is no doubt that the achievement of American artists has been great since the memorable year 1876: one has but to turn to the work of individual painter and sculptor, illustrator and engraver, for proof. But hitherto little has been accomplished in the way of mural decoration.

If this is, in a measure, because of the small chance offered to these artists, the neglect of the art is certainly not peculiar to America and Americans. Accomplishment has been only less limited in European countries, where the existence of fine traditions makes the neglect all the more unpardonable. The Italian rests upon his laurels, satisfied with the past's masterpieces. The Englishman, with sporadic enterprise, has allowed Whistler and Burne-Jones to decorate a few of his private houses, and Ford Madox-Brown at least one of his town halls—at Manchester—and he has taken pride to himself for giving Leighton and Poynter the freedom of South Kensington's Museum walls, with results the most disastrous, for letting Richmond loose in St. Paul's to experiment with mosaic, and for yielding other of his famous churches to the irresponsible amateur. Austrians and Hungarians rejoice in the flamboyant outbursts of Makart and Múnkacsy, in whose hands, surely, decoration has gone quite mad, while the Frenchman alone has reason to congratulate himself on commissioning his great men, now Puvis de Chavannes, now Besnard, to cover with their designs the walls of public buildings in Paris and the provinces. It is because the record of modern mural decoration the world over has been so meagre that more than a purely local or American interest is attached to the work of Mr. Sargent and Mr. Abbey for the Boston Public Library. Its importance in America can scarcely be exaggerated. A step in the right direction, doubtless, was made in Chicago; but the ephemeral nature of the buildings decorated, and the short time granted to artists for the task, necessarily detracted greatly from the value of the decoration done. Boston, practically, has supplied the first opportunity for serious effort.

A portion of Mr. Sargent's ceiling was exhibited in last spring's Academy, when I had occasion to speak of it. Now, Mr. Abbey is showing, in one of the smaller London galleries, so much of his frieze as is finished. Of course, as was the case with the ceiling—well arranged though it was for exhibition—the frieze cannot but lose from being seen in its present crude surroundings of red-draped walls. The designs, meant to be incorporated with a definite architectural composition, and to be placed at a certain height (nine feet) in a certain light, now hang at a much lower level than is eventually intended, in a different light, and with absolutely no architectural framing. However, it is possible to form a very fair idea of the scope and accomplishment of Mr. Abbey's decorative scheme. The subject, as the one design sent to Chicago explained, is the Quest of the Holy Grail. One may be inclined to question this choice as utterly irrelevant. It is not easy to understand the relation of Holy Grail to Boston Library. Of old, the artist, in decorating walls of church, or palace, or public hall, went for inspiration to appropriate holy legend or historic association, as did Sodoma in Monte Oliveto, Pinturicchio in Siena for instance, or in Venice, Titian, Tintoretto, and Veronese, the greatest of all the great masters of the art; and no one can doubt that colonial Boston would have furnished Mr. Abbey with more than one theme made to his hand. Or again, the modern, with Puvis de Chavannes, is content with allegory that belongs to no special period or tradition, and is without archæological responsibility. However, the paramount consideration is, not subject, but treatment. And it is in this respect that Mr. Abbey has the greatest surprise in store for his admirers. That he would reveal the utmost research and learning, that he would be accurate and careful in detail, that his archæology would be beyond reproach, one knew beforehand. But one was not prepared to find that, in working for the first time on so colossal a scale, he could still succeed in lending to his figures the same elegance and dignity, to his composition the same grace and spaciousness, that have ever distinguished his black-and-white drawings.

The designs so far completed are five in number: Galahad, as a mere babe, visited by an angel bearing the Holy Grail; as the youthful knight, after long vigil, ready to set forth upon the quest; installed by Joseph of Arimathea in the Seat Perilous of the Round Table; with the other knights, receiving the episcopal benediction for the search, now formally approved by Arthur; in the hall of Amfortas, the spell-bound, watching the Procession of the Grail.

It is in the first of these that greatest concession has been made to decorative conventions. A flat pattern of blue and gold, treated as so much wall-paper, is background for the nun who upholds the child and the wide-winged angel-bearer of the Grail. The figures are, however, rendered with absolute realism, so that they seem literally cut out from this conventional background, upon which they cast no shadow and the nun by no possibility can find resting-place. Here, Mr. Abbey, in blending realism and convention, has attempted the impossible, with inevitable failure as result. The figures are delightfully drawn, the pattern is skilfully executed, but the combination proves strikingly incongruous. In the four other designs he has broken away from all concessions and is frankly realistic. In fact, he is to be compared in his work not to a man like Puvis de Chavannes or Burne-Jones, with whom he has nothing in common, but rather to Besnard or Jean-Paul Laurens; though probably he has been more directly influenced by Sargent and Helleu.

In line and arrangement the Round Table, shown in Chicago, is best, with its sweeping curves of white angels and golden haloes; but one cannot help wondering if much of the beautiful detail will not be lost when the whole is seen from the proposed height. The three other designs have an architectural motive, suggested largely, I believe, by the wonderful old Romanesque work at Le Puy. In composition none surpasses the fourth, with its stately group of kneeling knights, each resting on

his shield and holding aloft spear and banner. But in freedom of handling and general technical execution the fifth and last is by far the most successful. Nothing could be more majestic and impressive than the figure of the pale Galahad in his flowing red robes, as he stands by the sleeping king; movement could not be more rhythmically expressed than in the procession of strange, mystic beings; while, simply as a piece of masterly painting, the group of low-bent figures to the left is most remarkable. Indeed, it seems a sacrifice of a fine picture to make this design wholly subservient to decorative ends.

Although one may criticise Mr. Abbey's frieze, it is safe to say that no American except Mr. Sargent could produce anything to compete with it; and this one ventures to assert even after having seen the decorations at Chicago and much of Mr. Vedder's later work. In carrying out a purely decorative convention, it may be that Mrs. MacMonnies is more than a strong rival, though in technical proficiency she is hardly his equal. But if Mr. Abbey does not fulfil the decorative conventions now accepted, that is no reason to declare him in the wrong. Has not Albert Dürer recorded the severity with which he was taken to task by contemporary Venetians for daring to defy tradition? However this may be, it is certain that Mr. Abbey and Mr. Sargent between them are giving the initiative to mural decoration in America, and that the Boston Library, in commissioning them, has inaugurated a most notable departure. The work now needs but the active coöperation of Mr. Whistler, who already has been invited to take his share in it. N. N.

Correspondence.

THE PRESERVATION OF CARLYLE'S HOUSE.

To the Editor of The Nation:

Sir: May I be permitted to enlist the aid of the *Nation* towards making more generally known in the United States the movement which has been set on foot in England for the purchase and preservation of the house which Thomas Carlyle inhabited in Chelsea for more than forty years? This movement has the support of many distinguished men; at its head is Mr. Leslie Stephen, known to many Americans not only as an eminent author, but as the originator of a similar movement for placing a memorial to James Russell Lowell in England.

The amount required for the purchase and repair of the house, for insuring its being kept in good condition for the future, and for the custody and exhibition of the personal relics of Carlyle, of which it is to be the depository, will probably be from £2,500 to £3,000. The commencement made is by no means discouraging, but it is felt that America might aid very powerfully, not merely by subscriptions, but by the moral influence of example.

I need say nothing to the readers of the *Nation*, either in defence of the general principle that the vestiges of great men ought to be cherished and preserved, or of its particular application to Carlyle. Still less need I seek to extenuate those passages in his conduct as regards the United States which are undoubtedly subjects for regret. His faults, as with all men of unusual force, were inherent in and inseparable from his great qualities. *Si non errasset, fecerat ille minus.* I will only ask leave to mention three considerations which might not so readily occur to the mind: (1) the extent to which America is herself responsible for Carlyle by the recognition she accorded to him, through Emerson and others, when he had as yet met with but little in his own country; (2) Carlyle's own selection of Harvard College as the recipient of his library; (3) the significance of international coöperation for such purposes as a sign of the times, and its happy effect in promoting amity and good feeling. We have recently placed memorials of Longfellow and Lowell in English public edifices, and have been repaid by the public dedication of a bust of Keats, a movement originated in America.

I have only to add that the treasurer of the fund is an American gentleman long resident in England, B. F. Stevens, Esq., known for his publications on Columbus and Franklin, by whom subscriptions will be received at 4 Trafalgar Square, London.

I remain yours very truly,

Richard Garnett.

British Museum, January 19, 1895.

THE KANSAS MORTGAGE-REDEMPTION LAW.

To the Editor of The Nation:

Sir: In your issue of January 24 you refer, in an editorial, to the recent mortgage-redemption law of Kansas as a Populist measure and a result of the Populist rule in Kansas. The *Nation* is usually well informed and accurate in its political history, but it seems to have absorbed the impression, general throughout the East, that all of the vagaries which have prevailed in Kansas in recent years are due to the Populists. The fact is that the Populists have never been in control in Kansas, excepting in the executive department. At one session of the Legislature the Populists had the House, while the Republicans had the Governor and the Senate. At the next session the Republicans had the House and the Populists had the Governor and the Senate. The responsibility for legislation, therefore, rests equally on these two parties. Further than that, the mortgage-redemption law of which you speak did not originate with the Populists. It was introduced in the House by J. F. Grunlee, a Republican member from Hutchinson, a wholesale grocer and Republican leader, and is commonly known as the "Grunlee mortgage law." It passed the Republican House by an almost unanimous vote, and was sent thence to the Populist Senate.

I may further mention the fact that at the previous session of the Legislature, when the Populists had the House, the House passed a much more reasonable and desirable mortgage law, which was killed by the Republican Senate, not because it was too radical, but because it originated with the Populists. The Republicans, during this period, were vying with the Populists in catering to the same sentiment. This mortgage law has been championed by the Republican press of the State as a Republican measure.

There are some Republicans and some Democrats in Kansas who have not been in sympathy with the hatred of creditors and capital that has been raging there for the past few years, but the Populists have not been perceptibly ahead of the Republicans in promoting this sentiment. Joseph Withrow.

Topeka, Kan., January 28, 1895.

PITHECANTHROPUS ERECTUS.

To the Editor of The Nation:

Sir: I have not been able yet to obtain a copy of Dubois's memoir on "Pithecanthropus Erectus," mentioned in the *Nation* for January 17 (p. 52), but the good summary and copies of illustrations published by Prof. Marsh in the *American Journal of Science* for February (pp. 144-147, pl. 2) have furnished data sufficient at least for a suggestion. Your notice well calls the find "remains of a preeminently hominine anthropoid." I cannot, indeed, find any *generic* differences between the remains and the corresponding parts of a man. The reference of such remains to a distinct family—*Pithecanthropidæ*—is, therefore, baseless; no differential characters have been given, nor can be given, from the material observed. The differences observable between *Hominidæ* and *Simiidæ* are very slight, independently of the psychical ones and their direct coördinates in the skull; there is no room for a *family* intermediate between the two. What may be the value of the differences between the so-called *Pithecanthropus* and *Homo*, I am not prepared to say. I will confess, however, that I cannot appreciate any. Of course, the exostosis of the femur was pathological.

Permit me further to correct a misconception respecting the views held by American palæontologists. None of authority, so far as I know, deny the close relationship of man to the *Simiidæ* and the derivation of man from a primitive form of that family. The only contention of any importance is whether man and the *Simiidæ* are derived from a lemuroidean stock directly or from the monkeys. Under such conditions, then, the view that man is derived from a form intermediate between existing Simiids and man would not be at all "at variance with that held by some of the American palæontologists."

Theo. Gill.

Columbian University, Washington, D. C., February 2, 1895.

Notes.

G. P. Putnam's Sons have in preparation an edition of Marryat's 'Midshipman Easy' with designs by representative American artists; the Baroness Tautphoeus's 'At Odds,' uniform with her 'Initials' and 'Quits'; and the 'Richelieu' and 'Agincourt' of G. P. R James, which may be followed by other selections from the same voluminous novelist.

The fourth of the five volumes of Prof. John Bach McMaster's 'History of the People of the United States' will be issued directly by D. Appleton & Co.

Macmillan & Co. announce a translation, by Dr. A. C. Porter, of Strasburger, Noll, Schenck, and Schimper's 'Lehrbuch der Botanik'; also, a translation of Dr. Ernest von Halle's report on American Trusts to the Verein für Sozial-Politik, thoroughly revised and enlarged; and a biography of Adam Smith, by John Rae.

Henry Holt & Co.'s February announcements include Ten Brink's five 'Lectures on Shakspere,' translated by Julia Franklin; and 'Jack o' Doon,' a romantic tale of the North Carolina coast, by Maria Beale.

Roberts Bros., Boston, publish this week a new edition of five of the late Robert Louis Stevenson's works in as many volumes, uniform in size and binding, including 'Travels with a Donkey in the Cévennes' and 'Treasure Island'; the fourth volume of Renan's 'History of the People of Israel'; and 'The

Woman Who Did,' by Grant Allen. Later, 'The Sons of Ham,' by Louis Pendleton; and 'Prince Zaleski,' by M. P. Shiel.

'Four Years of Novel Reading,' edited by Prof. Richard G. Moulton of the University of Chicago, will shortly be issued by D. C. Heath & Co.

'We Three and Troddles,' by R. Andum, with eighty-three illustrations in silhouette by A. C. Gould, is an English humorous work about to be published by Henry Altemus, Philadelphia.

Ginn & Co. have in press for the University of Pennsylvania 'A Primer of Mayan Hieroglyphics,' by Prof. D. G. Brinton, and 'The Rhymes of Gower's Confessio Amantis,' by Prof. Morton W. Easton.

B. F. Stevens, London, will shortly publish a small foolscap quarto volume, by Mr. Henry Harrisse, under the title of 'Americus Vespuccius: A Critical and Documentary Review of Two Recent English Books concerning that Navigator.' This bibliographical and historical survey will show the part taken by the merchant princes of Augsburg and Nuremberg in the celebrated expedition of Francesco d'Almeida to India in 1505, and will demonstrate when, where, and by whom, in what language and in what form, the alleged Vespuccian 'Reyse van Lissebone' of 1508 was originally written.

The seventh volume of *Garden and Forest* (New York), conducted by Prof. Sargent of the Arnold Arboretum; the sixth volume of that "entertaining magazine for lawyers," the *Green Bag* (Boston Book Co.), edited by Horace W. Fuller; and the twenty-fourth volume of the *Overland Monthly*, edited by Rounseville Wildman (San Francisco), have come to hand. Each abounds in illustrations, each in its own sphere or place is without a rival, and we can but wish a long life to each.

In a pamphlet of thirty-six pages entitled 'Note on the Ancient Mexican Calendar System,' and printed by Schulze in Dresden, Mrs. Zelia Nuttall publishes the most recent results of her researches in this difficult and complicated province of Aztec archæology. She calls attention to the institution of the *macuiltianquiztli*, or market, which was held every five days, and to the important fact that "the regular rotation of market-days and the day of enforced rest every twenty days were the prominent and permanent features of the civil solar year." Furthermore, "the religious-festival periods were partly movable and partly ruled by the central ritual year contained in each solar year." There is also a table showing the dates in the Julian calendar to which the days that begin the different Mexican years correspond. The substance of this pamphlet was communicated to the Tenth International Congress of Americanists, which met in Stockholm last summer. Fuller information on the points discussed will be given in a larger work now in press.

We are glad to see printed by itself Prof. Edward S. Morse's address, "On the Importance of Good Manners," delivered last year at Vassar College on Founder's Day. It is in large measure a criticism of our public and private manners by comparison with those of the Japanese, and may be recommended for reading in schools or for circulation in city quarters where the defilement of the streets is most outrageous. The little pamphlet can be procured for five cents apiece, or fifty cents a dozen, of H. B. Hastings, Box 250, Boston.

The lists of works on Korea, Japan, and China contained in the January Bulletin of the Boston Public Library are timely and valuable. A general reference, under the subheads Commerce, Manufactures, and Education, to the "Consular Reports" published monthly by the State Department, and giving much useful information on these and kindred subjects, would have made them more complete. The illustrations of this number are twelve views of old buildings and streets in the north end of Boston. The library was opened in its magnificent new quarters on February 1.

The fifth number of the Bulletin of the Bureau of Rolls and Library of the Department of State (bearing date May, 1894, though just issued), opens with a list indicating the arrangement of the papers of Madison, Jefferson, Hamilton, Monroe, and Franklin—the last collection being the pious work of Henry Stevens, who supplied "a perfect typewritten copy of every piece, made to correspond in matter to the originals." Here is the draft of Franklin's famous letter to Strahan, July 5, 1775, ending: "You are now my Enemy,—and I am, Yours, B. Franklin." There follows a continuation of the index to "Chapter A," miscellaneous papers of the Revolutionary epoch, which is not bad reading. The entries are mostly of writers, but are sometimes topical, like "Women in Office," a memorial of Mary Katherine Goddard of Baltimore, Dec. 23, 1789, asking to be reinstated in the postoffice, which she had held for fourteen years. The appendix (or two-thirds of the Bulletin) consists of a literal print of the U. S. Constitution and of its ratifications.

Mr. Raymond L. Bridgman's article in the February number of the *New England Magazine* on "A New Birth [Wanted] in the City and State" is remarkable chiefly for its assertion of a steady decline of late years in the quality of the delegation to the Massachusetts Legislature from the cities of the State, from Boston in particular. "Greatly and sadly deteriorated" is his phrase for the metropolis. His belief that "the managing politicians would be overjoyed to strengthen their tickets by the use of well-known and influential names" seems naïve enough, with Dr. Everett's experience fresh in our minds. A paper on the famous Lowell Institute of Boston ends with a complete list of lecturers and topics from the commencement in 1839. It goes well with an instructive review of "The Rise and Decline of the New England Lyceum System," by the Rev. E. P. Powell. Mr. Chadwick's historical sketch of the Harvard Divinity School can be read with pleasure even by Calvinists, and is the literary feature of the number.

The *Sketch*, the London newspaper which is published in the interest of the music-hall (as the variety-show is called in England), and which many libraries have subscribed for under the impression that it is purely a journal of literature and art, reaches a degree of indecency in some of its late issues which ought to insure its being removed from the shelves of rooms in which self-respecting folk are wont to congregate.

After nearly half a century of useful corporate life as a college exclusively for young men, Beloit College, Wis., has, by unanimous vote of its Board of Trustees, decided to admit (in and after October, 1895) women to all its regular courses and degrees—except to the preparatory department, technically known as "The Academy." This question has, it appears, been before the authorities for several years, and President Eaton, in making his announcement (January 16) of the proposed change to the present students—"interrupted by an applause which promised to break into cheers"—explained in a very manly way the reasons which had induced the Board to reverse the tradition of the past fifty years. While specific announcements of details are not yet issued, it is unofficially stated that the women will be instructed in the same classes with the men, but that "the woman's department will receive its appropriate development, with an organic life of its own worthy of Beloit College," and that, as soon as funds are available, dormitories for the new students will be erected on a woman's campus.

Although one of the youngest of British Universities (chartered in 1833), Durham could hardly discard without a struggle the conservative instincts which she inherited from ecclesiastical forbears. It is therefore matter for encouragement that, at its last convocation (in December, 1894), held in the venerable Castle Hall, Durham University voted a petition to the Queen in Council, praying her to grant power to confer degrees on women. It appears that in 1881 "regulations" were passed in convocation providing that, under certain specified restrictions, female students might be admitted to a degree in Arts; as a matter of fact no further action was taken, and the University was advised that its charter gave it no authority to grant degrees to women. The fact that there are at present more than 180 women students at the Durham College of Science doubtless partly explains the clause in the petition which recites, in explanation of the request, that since 1881 "the demand . . . has largely increased, and that the need for providing for the granting of degrees to women in all faculties, except that of divinity, has become widely felt." The votes in favor of setting the seal of the University to the petition were 17 to 1, and the result "was received with applause and hurrah."

Dr. Hans Reusch, director of the Geological Survey of Norway, gives an account of the "Norwegian coast plain" in his last annual report, illustrating its extension along the Atlantic border by an outline map. Unlike our Atlantic coastal plain, which consists of gently sloping marine sediments, once beneath the sea and now elevated to form part of the continental border, the coastal plain of Norway is regarded as the result of long-continued denudation, by which the resistant and disorderly rocks of the Scandinavian mountain-peninsula have been worn down close to sea-level along the Atlantic margin. Here and there remnant mountains still surmount the plain; and in consequence of a general elevation since its production, numerous valleys have been eroded in its once even surface. Fiords result from a partial submergence of these valleys, more or less modified by glacial action. Dr. Reusch calls attention to the control exerted by the coastal plain on the distribution of population; hundreds of thousands, out of the two millions of Norwegians, live on this surface of moderate relief. A brief abstract of the original paper is given by Dr. Reusch in the Chicago *Journal of Geology*.

Speaking of the relation of coastal forms to the conditions of population, mention may be made of a recent brief article by Dr. Fr. Ratzel, in which he shows that the ratio of area to periphery of a country constitutes only one peculiarity, and not the fundamental peculiarity, of coastal form, in spite of the importance that has been attributed to this ratio by many geographers. Ratzel instances our northeastern coast as an example of a very irregular land outline, but one which has nevertheless not sufficed to determine the seat of large populations, because of the comparative-

ly rugged and inhospitable interior. To the latter relation, therefore, Ratzel would give greater prominence in the discussion of coastlines than it has usually received. The article referred to is in the *Jahresbericht* of the Geographical Society of Munich.

We are requested to state that contributions to the projected English Dialect Dictionary from this side of the water should be sent through the American Dialect Society, of which Mr. E. H. Babbitt, Columbia College, is secretary.

—Vicarious globe-trotting—to Oudeypore or Guayaquil and Panama—is as a matter of course included in the entertainment *Harper's Magazine* offers to February readers. "New York Colonial Privateers" and "French Fighters in Africa" also make part of the programme; the handsome periods of Mr. Janvier's resonant style setting off the slightness of matter in the one article as Frederic Remington's brilliant illustrations do the descriptions of Poultney Bigelow in the other. The theme pertinent to any and every audience is, however, Herr Antonin Dvorák's "Music in America." It is needless to decide whether Herr Dvorák writes more as patriot or as musician. Certainly none should be able to resist the appeals he stoutly makes to national feeling, though there may be some who will take issue with his theory of the possibilities of the national melodies, as there are already those who find fault with the use made of them in a composition of his own. The recent example of his own country, Bohemia, gives weight to the buoyancy of his belief that the musical apathy of the country may be overcome, and music speedily assigned its rightful place in popular interest; and to complete the friendliness of his attitude, and condone the frankness of his criticism, he has found something to say for the quality of the American voice—has even been "startled by the strength and the depth of the voices in the boys who sell papers on the street." An article on "Art in Glasgow," which no one interested in the development of contemporary schools can afford to overlook, is contributed by Mrs. Pennell, while those who have followed Richard Harding Davis's excellent piece of fooling, "The Princess Aline," must hope that its conclusion next month will be as pure in tone, as light and sure in touch, and as humanly sound at the core as the two parts that have gone before.

—Besides the portion of its contents that is to be foreseen within a hair's breadth of certainty, there is likewise in *Scribner's* an element of the unexpected to give the number liveliness of interest. Also in the category of the actively interesting, though not in that of the unforeseen, belongs the article on James Anthony Froude, which, in the hands of Mr. Birrell, becomes a skilled appreciation. The one saying, that "sacerdotalism, whether enthroned in the Vatican or burning borrowed candles in Lambeth, was the enemy at whose head he aimed his blows," gives approximately the key in which the article is written, and the other, that for the last forty years of his life Froude "was a great, though careless, artist in words," the substance of its literary verdict. "Giants and Giantism" is the title of the novel paper in which Dr. Charles L. Dana seeks to annex new ground for the neurologist's ever-spreading territory. The brain of the giant is found to be the seat of his diseased growth, and anatomical investigation seems to prove that he is merely one more victim of the neurosis or nervous disorder which, in varying forms, it has become popular to diagnose in the case of writers, musicians, and *fin-de-siècle* women. The final conclusion, that acromegaly, or giantism, is a legitimate object of attack on the part of students of preventive medicine, opens up still another of the sanguine vistas in which that hopeful branch of science is continually growing richer. Bret Harte's "Question of Privilege" is a metrical *tour de force*, with mirth in the broad humor of its verse, but none in the picture of life it inimitably outlines—though hardly inimitably for those who remember "Doesticks's" Congressional debate in which the ante-bellum Southern sensitiveness discovered the dragging in of the negro question even in a poetical quotation ("The rose you deftly cullèd, man").

—The *Atlantic*, too, has a paper belonging in the line of what passes for new under the sun in methods of thought and observation, in the shape of an elaborate "Study of the Mob," by Boris Sidis. Mobs, the paper explains, are hypnotic phenomena manifested on a large scale, predisposition to hypnotism being produced in masses (as it is in the minds of individuals through any "quiet, uniform, and incessant perception," such as the passes of the hypnotizer), by monotony, as in the Siberian province of Yakutsk, where cases of spontaneous hypnotization are on record; and by social pressure. Social pressure, when laws and regulations press on the individual from every side, when personality is suppressed, when relations in life are fixed, is an even more fundamental factor than monotony in the production of "that peculiar hypnotic state of fascination which is so highly favorable to the formation of mobs." Russians, soldiers, and women is a new classification arising from an examination of the conditions of life which show the two hypnotic factors at their highest powers, and Russia is found to be the country whose history "is a mob history." There is an enlargement of the point of view thus presented of Russia in the following paper, by James Mascarene Hubbard, which describes that empire as a civilizing force in her conquered provinces in Asia. Facts of railroading, of engineering, of fleet-building, of manufacture, irrigation, and agriculture, are marshalled in support of the view that Russia's aggressive policy in the Caucasus and Central Asia, is justified by her civilizing agency, and that "the Russian has accomplished in twenty years what the Frenchman has failed to secure in Algeria in sixty years." This is a paper of the class, not too widely distributed, which passes the reader from place to place, not with intent of time-killing, but of gathering data for intelligent thinking. Mrs. Alexander Graham Bell's article on "The Subtle Art of Speech-Reading" has the prime merit of recording individual experience in language that distinctly represents it.

—An important topic—the preservation of national and State forests—is discussed in the *Century* in a series of letters from writers qualified to represent the varying points of view that must be considered in the interest both of the forests and of their proposed guardians. Pending the foundation of a school of forestry, which, after the example of Prussia, France, and England, is the only course open to an intelligent understanding of the necessities of the case, and during the years required to give its course of instruction at least once, protective control of the forests by the Army is called for by the consensus of opinion of the writers. A supplementary course of instruction in forestry for officers and military cadets, either at West Point or elsewhere, both for the present and in the future, is urged from most quarters, though the balance of evidence is against placing the entire care of the forests permanently in the hands of the Army. A standing need, however, of the Army, as the executive of an administrative staff of trained foresters, with the work of both supplemented by a protective staff "consisting of forest guards, and including private soldiers and non-commissioned officers, to whom lessons in forestry might be given at the post schools," is clearly explained in a letter by Gifford Pinchot, from Biltmore, N. C. The discussion has been called forth by a plan suggested by Prof. Charles S. Sargent of Harvard for forest preservation by military control, and the one point on which there is unanimity of conviction is the immediateness of the need for preservation. Probably the most widely read papers of this issue will be Mrs. Fields's recollections of Dr. Holmes, to which a number of his unpublished letters give a substantial charm of personality, and Mrs. Van Rensselaer's agreeably written "People in New York." There is printed word for believing Sir Edwin Arnold's "Passing of Muhammad" to be a "dramatic sketch"; otherwise, although passed from lip to lip among his wives, it might have been mistaken for one of the most undramatic of narratives.

—The fourth Occasional Paper of the John F. Slater Fund is a statistical sketch of the negroes in the United States, prepared by Mr. Henry Gannett of the Geological Survey, and deals with figures, but only very moderately with the reasons underlying the figures. It appears that in 1790 the negro element composed 19 per cent. of the total population, and in 1890 it was 12 per cent.; there were 18 times as many whites and 10 times as many blacks in the country in 1890 as in 1790; and for the last census period (1880–90), the percentage of increase of whites was 26.68 against 13.51 of the blacks, or almost double. Every combination of figures shows that in actual numbers the blacks are increasing; but one decade with another the relative increase has been less than, and it has been steadily surpassed by, that of the whites. It does not appear sound, however, to say, as is done (p. 9), that because in the first fifty years (1790–1840) the whites had increased more rapidly than the negroes (4.5 times to 3.8 times), therefore the greater increase of the whites (3.9 times against 2.6 times of the negroes) in the last half-century is not due to the enormous white immigration that set in in the forties. It would rather appear that the diminution of the white ratio (.6) implies a marked falling off in the natural increase of the whites during the period of reinforcement from abroad. Should this influx from which we are now suffering happily be checked, the decreasing proportionate increase of the whites would still further diminish. Since the cessation of the slave-trade (1808) the blacks have received no foreign addition. But it is doubtless true not only that the whites will always be dominant in numbers, but that the relative proportion of those of wage-earning years will always be greater. This last, however, involves questions of vital statistics and of domestic education, physical and moral, among the blacks not touched upon in this paper.

—Comparing the two races within the former slave States, where more than nine-tenths of the negroes are found and where the whites

have been very slightly affected by migration, the relative proportion has remained practically the same: 65 whites to 35 negroes in the hundred in 1790, 63 to 37 in 1840, 69 to 31 in 1890. During the first fifty years the Southern negroes increased more rapidly than the whites, but less rapidly in the last half-century, although it may be doubted whether there has been the same careful enumeration since the blacks acquired a full instead of a fractional representative value. In Southern towns of 8,000 or more inhabitants in 1860, 10.9 per cent. of the whites and 4.2 per cent. of the negroes were found; the reasonable explanation being that the negroes were held for labor in the fields. In 1890 the proportion of whites and negroes in these towns was 15.7 and 12.4 respectively. Two opposing forces influence the negro: his gregarious tendency, which leads him to the cities, and his inferior equipment for the competition of trade, which tends to keep him a tiller of the soil. Topographically the negroes are in excess in the low-lying, heated, and rainy regions, for which cotton, sugar, and rice are probably primarily responsible. Geographically the negroes are decreasing in the northern tier of the Southern States, and are drifting south. How far that is a migration and how far it is a question of vital statistics is not known. The vital statistics all through the rural South are unsatisfactory. The relative mortality of the negroes in the large cities is nearly double that of the whites, and the birth-rate must also be greater. Nothing is known of the relative morbidity of the race as a whole. The apparent criminal rate is much higher among the blacks; but discussion is empty until it is known how the laws are enforced, and especially the character of the crimes. The proportion of increase among the enrolled negro school-children in the twenty years from 1870 to 1890 was two and a half times that of the whites, and it is said that five years ago 43 out of every 100 negroes over ten years of age were able to read and write. If that is the fact, it seems to imply a large adult death-rate as well as great interest in primary education, for practically no Southern negroes could read or write in 1860. The extreme difficulties that beset negro education in many localities make this proportion of literacy the more remarkable and commendable. This paper, published at Baltimore by the trustees of the Slater Fund, is illustrated by seven diagrams and maps. In plate iii, "white" should read "negro."

—The significance of the coöperative undertaking conducted by Mr. Traill in his editing of 'Social England' has already been spoken of in these columns, on the occasion of the appearance of the first volume. The defects of the second volume—covering the period from the accession of Edward I. to the death of Henry VII.—which has just been issued by Messrs. Cassell and Messrs. Putnam, are the same as those of the first: too great a multiplicity of interests, and an evident disproportion in the space allotted to the several topics. Yet the idea of the book is an excellent one; and it contains a great deal of good work, ranging from painstaking compilations from secondary authorities up to the brilliant essays —too few and too brief—with which Prof. Maitland lights up the history of English law. We hope we may regard these as foretastes of that great history of English law which we have so long been expecting from him. And while such contributions as these, and those of other recognized authorities on their subjects, like Mr. Hubert Hall, make the book desirable by the scholar, the fairly high level of its execution throughout and the modernness of its tone will commend it to our colleges. Fortunately, the writers are sufficiently at variance among themselves to set their readers thinking.

—The third volume of Dr. Hans Blum's 'Fürst Bismarck und seine Zeit' (Munich: Beck) contains a history of German affairs from 1863 to 1867. The most conspicuous events of this period were the wars against Denmark and Austria, the details of which do not come within the limits of the present work. Strategic movements and bloody battles are mentioned only so far as they exerted a more or less direct influence upon diplomatic negotiations. It was in this field that Bismarck conducted his sharp campaigns and won his brilliant victories, without which the most splendid and decisive feats of arms would have failed of their ultimate purpose. The masterly skill with which he prevented any intervention of the European powers during the hostilities with Denmark in 1864, and fairly forced their consent to the annexation of the duchies, was something of which he had every reason to be proud, and is still fain to speak as the most difficult and most successful of all his diplomatic achievements—a judgment which every reader of Blum's clear and consecutive account of the matter will fully endorse. In 1866 he had not only to conciliate foreign nations, but also to curb the impetuosity of military leaders who, as he wrote to his wife, were intoxicated by success and seemed to think they had conquered the world and could use their pleasure in disposing of it. "It is my ungrateful task to pour water into their too exhilarating wine, and to remind them that we are not living alone in Europe, but with three neighbors." There is no lack of spicy incidents and comical *contretemps* growing out of his relations to intriguing diplomatists and to hostile members of the Chamber of Deputies. One day the Austrian ambassador to the Federal Diet, Count Rechberg, received a despatch instructing him to vote with Prussia for a certain important measure, accompanied with a confidential letter directing him to induce the representatives of the other German states to vote against the measure and thus defeat it. In his haste he handed the wrong paper to Bismarck, who read and returned it with the remark: "There must be some mistake here." Rechberg saw his blunder, and grew pale and excited. "Don't be disturbed," said Bismarck; "you did not intend to give me this document, and therefore you have not given it to me, and I am wholly ignorant of its contents." In fact, he made no mention of it in his official reports, and thus won Rechberg's gratitude, besides having him henceforth "on the hip."

THIERS REDIVIVUS.—I.

History of the Consulate and the Empire of France under Napoleon. By L. A. Thiers. 12 vols. London: Chatto & Windus; Philadelphia: J. B. Lippincott Co. 1894.

History of the French Revolution. By L. A. Thiers. 5 vols. London: Richard Bentley & Son; Philadelphia: J. B. Lippincott & Co. 1894.

"THERE is not one only, but there are twenty different methods of writing history. It may be written in the style of Thucydides, Xenophon, Polybius, Livy, Sallust, Cæsar, Tacitus, Comines, Guicciardini, Macchiavelli, Saint-Simon, Frederick the Great, or Napoleon, and be superlatively written, although very differently. I would desire nothing better of Providence than to have acquitted myself as the least eminent of these historians, in order to feel certain that I had done well, and that I should leave behind me a memento of my ephemeral existence."

A man who ventures to introduce himself to his readers in such company—though it be done in the garb of modesty rather than of offensive self-conceit—has certainly no mean opinion of his own worth. Does posterity recognize the right of Louis Adolphe Thiers, who penned those lines in the preface to his 'History of the Consulate and the Empire'—written ten years after the publication of the first volume of the work—to name himself in the same breath with those illustrious men? We cannot argue this from the fact that forty (and partly more than fifty) years after the publication of his two voluminous works, judicious publishers deem it a good commercial venture to offer a new edition of the English translation to the public of Great Britain and America. In all probability the extraordinary revival of interest in Napoleon and his epoch is at the bottom of this republication. The great political rôle played by Thiers himself can hardly have entered into the calculation. Steam and electricity have made the world live fearfully fast, and nearly twenty years have passed since Thiers practically stepped down from the political stage. Men and women under thirty years of age at least have no immediate consciousness of his having been one of their great contemporaries. The works must sell as the productions of the historian and not of the statesman Thiers, or they will not sell at all. We think that they will sell; but is it desirable that they should find a good market? That is a very different question, and the right answer to it is by no means an unhesitating and unqualified yes. We should say, that depends upon how they are read. It seems unnecessary to add, "by whom," for the scholar must turn to the original. The republication being a translation, it can be intended only for the general public.

The general public cannot be expected to hunt up what competent judges said forty to fifty years ago. Nor would they know, even if they did, what the present standing of the historian Thiers is. If the "Preface to the English Edition" of the 'History of the French Revolution' was to be retained as an integral part of the reprint, it should have been dated, for one finds in it the following assertion: "It [the History] may justly be pronounced the best that has been written on a very momentous period; the safest, as well as the most entertaining; and when we refer to the long list of eminent authors who have employed their pens in the description of this gigantic moral earthquake, it is no slight commendation to be placed at the head of the phalanx." As to the "most entertaining," it would be bootless to controvert the proposition as long as tastes differ. But how about "the safest"? The work done in this field by French and foreign scholars during the half-century that has elapsed since Thiers wrote his history is stupendous. By the hundredweight new material of importance has been brought to light from the dusty alcoves of public and private archives. Trained historians—many of them men of a very high, if not the very highest, order—have sifted it critically and determined its bearing upon the evolution of the grandest historical drama. If, in spite of all that, the son of a poor workman of Marseilles, whose professional training was that of a lawyer, not of an historian, and who devoted by far the

larger half of his time to journalism and politics, is still the safest guide through the bewildering mazes of the French Revolution, he must have been much more than a prodigy; he must have been a genuinely inspired seer. By supernatural intuition he must have divined what he could not know, for the documents revealing the facts had never come under his eye. Nobody has thus far felt tempted to stand sponsor to such a superlatively absurd claim. Nobody can, therefore, deny that Thiers's History of the Revolution must be of necessity in a high degree antiquated.

This is not saying that it does not still deserve to be read. In a sense it really is, as the preface to the English edition avers, "a classic." To those, also, who are in search of something more than mere entertainment its perusal will be profitable. The easy and graceful flow of the narrative, the unaffected and well-tempered simplicity of style, the elegant and exquisitely proportioned structural arrangement, the unsurpassable lucidity of statement, can be studied to great advantage not only by the historian, but also by the journalist, the novelist, the lawyer, the pulpit orator, the economist, the teacher—in short, by everybody who, for the benefit of others, has to put thoughts into language and to present facts. But to direct any one who primarily wishes to learn what is known to-day of the true history of the French Revolution above all to Thiers, is far worse than to urge Niebuhr rather than Mommsen, Ihne, Marquardsen, etc., upon the student of Roman history—far worse because Niebuhr's critical scholarship lit a powerful beacon-light which, so far as its rays penetrated, dispelled darkness for ever, though they did not bring the effulgence of the noonday sun. Thiers, as the historian of the Revolution, was not for a single year anything of the kind. Unequalled as the narrator of its course, he had, as a critical investigator of it, even in his day, not only his peers, but his superiors. Again, as to original research, he holds no mean place among the historians of the century, but the fame he is justly entitled to in this respect was principally, though not exclusively, achieved in later years. Certainly a vast amount of reading was done for the History of the Revolution, but much of it was done for him by others; and the public meant no offence when, in the earlier years of Thiers's fame as an historian, they habitually adorned him with a tail—"*les historiens de Mons. Thiers.*" Such reading as he did himself was not done so much in the spirit of the plodding scholar, who patiently devotes days, weeks, and months to clearing up a doubtful question, because he has no ulterior object, searching after truth for truth's sake, but rather in the spirit of the intensely interested spectator, who cares more to see and to understand than to know, and therefore always rests satisfied if he feels reasonably convinced of having grasped correctly the situation as a whole and the positions of the principal figures.

The assertion that Thiers cared more to understand than to know calls for an explanation. In the first-mentioned preface to the 'History of the Consulate and the Empire' he declares "intelligence" to be the quality the historian needs above all, and elaborates this thesis almost to the extent of an essay. His argumentation is eminently characteristic of him, and delineates with graphic precision his own way of studying and writing history. Thiers was possessed of a truly prodigious amount of what he understood by intelligence. His every fibre quivered with it. He could not help being intelligent as to everything, for it was his very nature. In a sense there was no merit in the wonderfully transparent lucidity with which he presented everything, not only when he wrote, but also when he addressed the Chamber from the tribune. It required no effort on his part to make the intricate plain and the involved perspicuous. He did not unravel the tangle; it was no tangle to him. Under the influence of sentiment and ambition, he did at times strive to close his ears against the promptings of this domineering intelligence, but he succeeded only very indifferently. Nevertheless, though he was amazingly intelligent, he was by no means possessed of an intellect of the first order. Whatever he saw he saw with remarkable clearness, but neither was his range of vision extraordinary in extent, nor did he see everything that lay within its limits. He characterized himself as "devoted to the modest worship of good sense" (*Hist. of the Cons. and the Emp.* v., 3); and truly, for his intelligence, though prodigious, was after all only the intelligence of good or common sense. It was clear, comprehensive, keen, sure-footed, and good taste, tact, and sparkling *esprit* served it as most helpful handmaids; but it was neither profound nor lofty. He therefore could become famous and do meritorious work of a high order, but the wreath of real greatness was not within his reach, either as historian or as statesman. If his character had been moulded on a grand scale, it might have counterbalanced and even outweighed his intellectual limitations. But the deeper cause of his intellectual qualities not rising to a higher level was exactly that his character, though of untarnished respectability, wholly free from low and sordid ingredients, and capable of a devotion challenging admiration, was, after all, in the main not above the common stature. As his intelligence was preeminently that of common sense, so were his moral standards in politics commonplace, and the political ideals he was striving after those of the common crowd—using the words in their natural meaning, and not in the customary disparaging sense. In his whole way of thinking, feeling, and aspiring he was the most exquisite embodiment of the typical traits of the French *bourgeoisie* the nineteenth century has produced—the weak and reprehensible more or less toned down and smoothed over, and the strong and good partly developed almost to perfection, but still—to paraphrase *King Lear*—every inch a French *bourgeois*, nothing else and nothing more.

The writer of the preface to the English edition of the History of the Revolution calls Thiers "a worldly statesman, with no strong passions or prejudices to mislead his judgment." He might have added—nor with strong convictions to bar his way. Not that he was not honest in his convictions, nor that he lacked convictions to which he was, in a way, faithful throughout his life. But neither upon his intellect, nor upon his sentiments, nor upon his conscience did these convictions have sufficient hold to prevent certain other sentiments of his, which collided with them, from getting the better of them and of him. He did not renounce or deny his convictions, but, under the pressure of those other sentiments, he became very accommodating, bidding the convictions just to keep discreetly in the background for the time being, and utilizing his dialectic powers for establishing a *modus vivendi* between yes and no. His lack of profundity stood him in good stead in this intellectual and moral thimblerigging. If he had not kept so near the surface, he would have found it less easy to persuade himself, even more than others, that this weakness was in truth a great merit.

"I have endeavored to stifle within my own bosom every feeling of animosity; I alternately figured to myself that, born in a cottage, animated with a just ambition, I was resolved to acquire what the pride of the higher classes had unjustly refused me; or that, bred in palaces, the heir to ancient privileges, it was painful to me to renounce a possession which I regarded as a legitimate property. Thenceforward I could not harbor enmity against either party; I pitied the combatants, and I indemnified myself by admiring generous deeds wherever I found them."

That is, according to his own declaration, the spirit in which he had studied and written the history of the Revolution. Can a more appropriate spirit be conceived of? If the question could have been submitted to a vote of all the factions, ought he not to have been their unanimous choice as historian of the Revolution? For surely each had good cause for gratification and none any reason to complain. *Sine ira et studio*, and in addition a heart large and generous enough to have a responsive pulse for all! "Objectiveness" is recognized as a prime requisite of the historian's mind. Is this not objectiveness in the sublimest form?

An eminent German historian thought differently. Ludwig Haeusser thus depicted the results of this way of looking at history:

"Thiers has made us share and live through all the sentiments of the different epochs; we rejoice, embrace, rhetorize with the Constituent Assembly; we bluster with Camille Desmoulins and the Palais Royal; we become fanaticized with the Convention and weep with the imprisoned royal family; and though our hearts must ache in accompanying the Gironde to the guillotine, we can, after all, not help looking with sympathetic admiration also upon the fabric of terror which Danton, Robespierre, and Barère are erecting. No party has a right to complain, for each finds a side dressed up to its taste by the author; nobody is angry; circumstances, fate, necessity are responsible for everything; all individuals, from Louis XVI. and Marie Antoinette down to Robespierre and Marat, were at bottom unexceptionable people."

So it is; "this tolerant fatalism" practically eliminates moral responsibility. The history cooked by Thiers according to the above-mentioned recipe is a very palatable and easily digestible dish, but a close analysis reveals the fact that the ethics contained in it are so diluted as to remind one of Abraham Lincoln's meat broth made from the shadow of a pigeon that had died of starvation.

This in part accounts for the admirable success with which Thiers has lived up to his maxim that "the reader must be spared all effort of attention." It besides points directly to the foremost among the reasons why, as the preface to the English edition states, "he has no tendency to enter into long investigations of causes which he leaves the reader to discover for himself." Thus he has as much consideration for himself as for his readers. It is an excellent device to spare himself arduous efforts, but it proves that, though he is more anxious to understand than to know, his desire to understand is confined to pretty restricted limits. But if the author does not take the trouble to search for the causes, and the reader is spared all effort of attention, it is easy to imagine how that must affect the reader's really *understanding* the period whose history he is told. Certainly, it is not the historian's function to indulge in moralizing homilies, but to present facts. But the causes are an essential part of the facts—we are tempted to say that they are in a sense their vital principle. If the facts are not fully

grasped in their double character of effects and causes, so that the story clearly reveals "the causal *nexus*" of an organic tissue, we do not get the true historical facts, but merely their shells. History then fails to fulfil one of its principal, most responsible, and most beneficent tasks.

The muse of history stands foremost among her sisters, provided her records are written in such a manner that she can rightfully engrave upon her tablets the inscription, *Mortui vivos docent*. Strange as it may seem at first sight, Thiers was, in spite of all we have said, only too ardent a votary of this principle. It would be doing singular injustice to him to consider the History of the Revolution merely as a history. To-day it is nothing but that; originally, however, it was, besides, something else, and, judged from the historical point of view, something greater than a mere book. Though, as we heard Haeusser say, nobody was angry and each party found a side dressed up to suit its taste, it was conceived as a political manifesto, and as such it became a political deed of far-reaching, beneficent effect. It was a political manifesto against the Bourbonism incapable of either learning or forgetting anything—the Bourbonism outdoing the "red Terror" by the "white Terror"—the Bourbonism saddled with the "*chambre introuvable*"—the Bourbonism making the day of the execution of Louis XVI. an official day of national prayerful contrition—the Bourbonism inflicting upon the "*France intérieure*," *i. e.*, the overwhelming majority of the nation that had willed the Revolution, the audaciously arrogant and shamelessly egotistical rule of the "*France extérieure*," *i. e.*, the emigration—the Bourbonism glorying in the "missions," with their revival of mediæval fanaticism and their gross mediæval tricks—the Bourbonism of the "Congregation" and the Jesuits, readmitted into the realm and lifted into power in flagrant violation of the law—in short, the Bourbonism which systematically led up to the July ordinances of Charles X. and Polignac, and thereby to the July Revolution. The faith of the people in the Revolution was revived. Though they continued to be cut up and rent into factions, the reading of these records, more fascinating than the most interesting novel, was a powerful factor in rallying them on the common ground that, in spite of everything, it had not been all a terrible mistake, for which the nation ought to do penance in sackcloth and ashes. Those who wanted to draw this inference from the fact that the brothers of the decapitated king were seated on the throne, were understood to be the true enemies, and the only enemies common to all whose hearts beat strongly and warmly for the welfare of whole France. Therefore it was an excellent tactical move to spare the feelings of all and have a kind word for all. It was the surest means to make all join minds and hands in resisting the attempt to have the vicious idols smashed by the Revolution again set up on their pedestals.

Besides, it was the stepping-stone to the ulterior end. Contending against the lapse of the Restoration into headlong reaction would naturally lead to the reawakening or the strengthening of the positive attachment to the great underlying ideas of the Revolution. To prevent the resuscitation of the hated *ancien régime* from its bloody tomb was not enough. What was sound in the tenets and maxims of the Revolution had to be made again active forces in the minds of men, and thereby in the institutions of the country. This, too, required the conciliation of as many as possible, and it could best be attained by moderation, and by propagating the true faith indirectly by means of an inspiring narrative of its history, rather than by direct preaching and the display of a partisan spirit. The astute mind of Thiers saw all this the clearer because he was by temperament as well as by conviction a moderate Liberal, and his great natural abilities as a political tactician were developed to a high degree of perfection in the school of journalism under restrictive press laws. Other historians might have seen it too, and still would not have allowed it to exercise any influence whatever upon their work. With Thiers that was wholly out of the question, because he was primarily and above all a politician and not an historian. That the rôle of the historian exercised such a powerful charm upon him was in great measure due to the fact that history could be made a serviceable vehicle for political purposes, and he made it such a vehicle consciously and of set purpose. To say that he would not have become an historian if history could not have been utilized in this way, would be to overshoot the mark. But that he never lost sight of this fact, and that it was at times the uppermost consideration in his mind, can be irrefutably proved from his works. The critic of the historian Thiers who does not constantly ascertain when the volume in hand was written, what the political situation of France was at the time, and in what predicament it put the politician Thiers, is sure to make an occasional slip and to pass by many a suggestive or even important point. On the other hand, if he does not fail to make these inquiries, it will be fully revealed to him how the marked growth of the historian Thiers stands in close causal connection with the ripening of Thiers the public man (composed in about equal parts of the politician and the statesman) in the school of disappointment and adversity, into a full-sized statesman only slightly tainted with the proclivities of the politician.

ALBERT MOORE.

Albert Moore, his Life and Works. By Alfred Lys Baldry. London: George Bell & Sons; New York: Macmillan. 1894. 4to, pp. xii, 110. Many illustrations.

Albert Moore (christened Albert Joseph) was born in 1841, the son of William Moore, a portrait-painter living at York and not without reputation, who, like his more distinguished son, has found a place in the 'Dictionary of National Biography.' Albert Moore exhibited two studies in the Royal Academy when he was only sixteen, and from 1860 to 1893 his pictures were constantly shown at the Academy, as well as at the Grosvenor Gallery and other public exhibitions in London, and larger works in the way of wall-painting were executed in different parts of England. No man's work excites greater interest among artists, and none proves more interesting to the student. He is, however, very little known in this country, and even in England is seldom named as a really eminent and distinguished painter. The 1889 edition of Bryan's Dictionary knows him not; the almost all-embracing Seubert, edition of 1882, barely names him as a "*Mlr. der Gegenwart in London*"; Müller's 'Künstler-Lexikon' gives him one of the briefest of notices; Clement and Hutton, in 'Artists of the Nineteenth Century,' give him only eight lines besides some quotations. It is not more than justice requires that the present very handsome and very important book should be devoted to this artist, who, as Mr. Whistler has said, just missed being a very great man.

The book shows at once how he missed greatness and how near he came to it. It is a record of a busy life, and of a large production of the most artistic, the most comforting, the most gratifying and delightful pictures, in which, however, there is lacking that divine fire which burns in two or three men in a century. The book contains many full-page photographic pictures, of which ten are photogravures, and contains also head- and tail-pieces and other text illustrations, bringing the whole number of reproductions of Moore's work up to about eighty, and including also a portrait of William Moore and two photographs from life of the artist himself. This is what is most important in it, as may be said without disrespect to a very competent writer. The text, which is not very voluminous, devotes a chapter to the artist's biography; then two chapters to a record of his works, "From Year to Year," 1857 to 1874, and 1875 to 1893; then a chapter to his "Working Principles" and one to his critics. A list of Moore's pictures, the years of their production, and the places of their exhibition, and a full index, complete the book.

No modern painter has lived more wholly in his art of painting than Albert Moore. His pictures have nothing to do with literature or with history, with peasant-life or child-life, with anecdote or with mysticism. He chose as his subjects things which would be lovely in pictures, and kept steadily before him as his one end and aim the production of pictures which would be delightful to look at. That is to say, he was as indifferent to story-telling in art as Paul Veronese. And if it is an adequate description of Veronese to call him a decorative painter, it is equally sufficient as a description of Moore. All depends upon what you mean by "decorative." If it is decoration to produce in painting what no other art can supply, and to ignore that which another art, namely, the art of words, can do better, then the Cinquecento man and the modern man are decorators alike.

One of Moore's most valuable pictures is "The Quartette," painted in 1869 and exhibited in the Royal Academy. It is three feet long and contains seven figures. Four men are seated on a prominent seat, a solid bench running the whole length of the room as we see it: above them is a shelf of which there is something to be said. Between the men and the spectator stand three women, two together and half-embraced, the third alone, all looking fixedly and as if in a trance at the musicians. For the four men hold two violins, a viola (probably), and a 'cello; and a concerted piece of music is in process of execution. The double-bass lies upon the shelf above, and vases filled with flowering branches occupy the rest of it. The four men are dressed somewhat in ancient Greek taste, three of them in loose draperies and the fourth in leopard-skins; their hair is in short curls; one wears a slightly indicated cap, and one a fillet. The three women are all clothed in abundant drapery, more ample than the Greek, more free and loose than the Roman models; and their hair is dressed in the simplest way, drawn back loosely and coiled at the back of the head. The musicians are intent upon their delightful task, the women as intent upon the music and the musicians. There is no other thought, no lingering or suggested love-making or purpose apart from the music; so much general or unpainterlike subject there is and no more. And

the picture is rife with interest. It is impossible to weary of it; young people and old, beginners and veterans in the study of gallery pictures, love it alike. Examination shows that the figures are admirably drawn and posed, the draperies most skilfully cast, the faces full of quiet expression.

The indifference of the painter to archæology is complete. Not only are the garments and draperies of no historical epoch, but the exquisite designs of parts of furniture, doors, screens, and the like are not to be classified as of any epoch, nor does Mr. Moore hesitate to put a violin or a palm-leaf fan into the hand of a figure draped in what may pass for a classical fashion. The violin and the fan are beautiful in form, and that clearly suffices for this singularly abstract and ideal art. The picture called "Dreamers" was exhibited at the Royal Academy in 1882, and is four feet long. We propose to describe it at the risk of making the reader laugh. A long bench here also runs along the wall, and it has a moderately high back upon which the head of a sleeper may be laid as she sits upon the bench. Three such sleepers there have been, beautiful girls, but one of them has just waked, and has raised herself; the other two, in attitudes repeating each other in many respects, are deep in their dreams. A lovely pattern covers the wall, and another adorns the stuff which covers the sofa, but the girls are in drapery of unfigured stuffs, and this and some other drapery forms a large part of the subject of the picture. The sleepers are sound asleep: they are heavy on the bench and their heads are heavy on the ledge which supports them. The awakened girl is only just conscious of the external world.

An excellent critic, considering these pictures of no literary or anecdotical subject, in which the human figure, nude or draped and treated for itself alone, is always the principal thing, declares that Moore's way of looking at his subjects and at his work was a sculptor's way. To this it may be answered that he cared too much for color, too much for lovely patterns in color, too much for flat designing as if of inlay, as contrasted with relief designing, to be called a would-be sculptor. Moreover, the excellent use of landscape-backgrounds, as in "Follow My Leader" (1873), "Oranges" (1885), and "An Idyll" (1891), as well as the use of landscape for more than a background, as in "Waiting to Cross" (1888), and "The Loves of the Winds and Seasons" (1893), is proof enough of the painter-like mind of the man.

His peculiar use of color is also to be kept in mind. The picture called "A Revery" was exhibited at the New Gallery in 1892, and was afterwards sent to the Chicago Exhibition: it contains but a single figure, and is not quite four feet high. A draped woman is sitting in a very rich, throne-like chair; behind the chair is a screen most elaborately adorned with a flat pattern; and a marble inlaid floor receives the sitter's feet. The lady holds a fan, and some large flowers are thrown loosely upon the pavement beside her; other flowers fill large vases, and a branch of marigolds comes into view from beyond the frame in the upper right-hand corner. All the tone of color is high and pale. The drapery is generally yellow, cream-color and orange; the chair is ivory inlaid with pearl; the screen is pale-green and silver. A tendency to very light colors exists in all of Moore's work that we know of or can get word of. He saw colors as most men see them, and was not in his choice of them akin to the "Impressionists," but the colors which he cared for and desired to render were always the bright, pure, and light ones. This peculiarity of his work has brought on the argument which our author holds with Mr. Sidney Colvin, admitted to be the most sympathetic critic of all those who have analyzed in the journals Moore's work as a painter. Mr. Colvin is quoted as having said that, after all, "the kind of color which has been practised by the Venetians and by all the great schools of painting in Europe" is to be preferred. Mr. Baldry takes exception to this dictum in a very sensible way, like a student of Japanese painting and of the new thoughts that art has given to the West, like a champion of free thought everywhere. The Venetian color was a convention, he declares; and no one can gainsay him. Why should we not have other and different schemes of color, each admitted as good in its way? "The lover of the old convention admits nothing as color which is not low-toned and heavy, full of mysterious gloom. The laughing brilliancy of the open air, the sparkle of light, the dainty pattern of bright hues, softened and diluted by the all-pervading radiance of the scene, give nothing better than what Mr. Colvin calls a 'thin and abstract system of color.'" So protests Mr. Baldry against a too conservative criticism; and these words may remain the last of our notice of his hero—certainly one of the most eminent of modern artists—and of the very valuable book devoted to him.

RODWAY'S BRITISH GUIANA.

History of British Guiana, from the year 1668 to the present time. By James Rodway, F.L.S. Volume III. 1833–1893. Georgetown, Demerara: J. Thomson. 1894.

To Americans, British Guiana is a place the very name of which is all but unknown. Some learned of it for the first time on visiting the World's Fair at Chicago, where the exhibits of the colony were displayed to such advantage by Commissioner Quelch as to attract considerable attention; but here again not a few persisted in identifying Guiana with Guinea. There are, nevertheless, merchants in New York and other commercial centres who have interests of a very solid kind in the trade going on between Great Britain's colony on the mainland of South America and the United States. From Portland, Me., and Boston, whence are shipped cargoes of ice and iced provisions; from New York, whence go a number of general cargoes; and from Fernandina and other ports in Florida, whence are exported quantities of pitch-pine lumber—the year round there are vessels over which float the stars and stripes, bound to Georgetown, the capital of British Guiana, or to New Amsterdam, another port of the same colony. From the latest published customs returns of British Guiana, it appears that the value in gold of the last year's trade of the colony with the United States amounted to, in imports, $2,310,000, and in exports $4,312,000; the latter consisting mainly of the sugar so famous as "Demerara," the name of the most important port of the colony. The tyranny of the Sugar Trust and the barrier of high duties, have hitherto prevented Americans from enjoying the luxury of the straw-colored grains of the Demerara sugar.

It is of this colony that a history has just been completed by Mr. James Rodway, F.L.S., the accomplished librarian of the Royal Agricultural and Commercial Society of British Guiana, and the editor of that Society's scientific journal, *Timehri*, so called after the aboriginal word, in Guiana, for the mysterious picture-writings on some of the rocks in that part of the world. It is not only in *Timehri* that the editor's contributions will be found. He has written papers in such London periodicals as *Natural Science* and the *Cornhill* and *Longman's;* and his delightful paper upon "Orchid-Hunting in Guiana," which appeared a few months ago in the *Cornhill*, attracted deserved attention. Mr. Rodway's literary and scientific labors have just been further manifested in his production of a work entitled 'In a Guiana Forest: Studies of Nature in Relation to the Struggle for Life' (London: T. Fisher Unwin; New York: Scribners).

Having already noticed in the *Nation* the first two volumes of Mr. Rodway's History, it is only left to deal with the third, which brings the narrative down to 1893. Seeing that, in 1895, the third century will be completed since Sir Walter Raleigh made his first voyage to Guiana (of which he has left us an account in that "quaint and curious volume," published in 1596 with the title of 'The Discoverie of The Large, Rich and Beutiful Empire of Guiana'), Mr. Rodway has produced his work very timeously. Time is still working wonders. When, in 1876, we gave ourselves up to celebrating the centenary of the Declaration of Independence, people in Old England sagely remarked that the observance of centenaries was characteristic of a young nation with a short history. All this sagacious superiority is now cast aside; and not only has the centenary of a great event, like that of the defeat of the Spanish Armada, been commemorated, but "celebrations" of centenaries are so much the fashion that not only events but individuals also have their centenaries honored in the Old Country. Edmund Gibbon has just had this honor. Who knows but that Sir Walter Raleigh, whose Life the same Gibbon once contemplated writing, may receive this distinction in 1895 from his countrymen, who regard him as a great Englishman? Americans, too, may have something to say of one who did so much to promote English colonization in the New World.

It is of the period from the emancipation of the slaves, in 1834, to the present time, that Mr. Rodway's third volume treats. The history of British Guiana has, since the emancipation, been very much a history of its plantation labor question; for, until the rise of its gold industry, in 1888, the colony was for the most part a vast sugar-plantation. The timbers of British Guiana are not sufficiently well known to cause any great development of trade in that respect, although the "greenheart" is so celebrated for its enduring qualities as to be sought for when great harbor works are being constructed. To the building of a pier at Ostend, or towards the making of the Manchester ship-canal, many a great "log" of "greenheart" has gone from the colony. And yet the sugar industry has so overtopped that of timber that the latter has not hitherto been regarded as "a good second" to the former. Shortly after the abolition of slavery a large number of the emancipated laborers left the plantations. Wages rose accordingly. The planters soon found that they could not afford to continue cultivation at such a high cost for labor. They had been accustomed to the African as a tiller of their fields, and they sought to procure African laborers from out-side. The British Government, then maintaining a squadron on the West Coast of Africa for the suppression of the

slave-trade, forbade the recruiting of laborers in that quarter. In the neighboring West Indian colonies, the local planters wanted their own people, and discouraged recruiting for British Guiana. Laborers were brought from Madeira, the Azores, from the East Indies, and from wherever else they could be got. Even a few Germans and Irish were imported. At last, immigration from India and China became an established fact, and now 4,000 or 5,000 coolies are annually imported from India. As these East Indians have all hitherto enjoyed the right of a free return passage to India, at the expiration of ten years' residence in the colony (a right which many have exercised), and as the number of females introduced is less than that of the males, this system of immigration has not proved, up to the present time, as successful for purposes of colonization as could have been wished. The amount spent upon immigration, from first to last, by the planters and the Government of the colony together, exceeds twenty-two millions of dollars. The pluck with which the sugar industry has been maintained in British Guiana, and the scientific skill with which the manufacture of the staple has been carried to perfection, have as yet survived the harassing expedients of the Sugar Trust and the discouragement of an American high tariff. The American consumer may yet find in "Demerara crystals" one of the needs of his breakfast and tea-tables.

To a description of the rise and development of the gold industry of the colony, Mr. Rodway devotes two chapters. From a tiny shipment of 250 ounces in 1884, the export has risen to 137,629 ounces in the colony's last financial year. This is the product of surface washings solely. Various enterprises for quartz-mining in the colony are now under way; some local, others with outside capital. Among the latter is the New York and British Guiana Gold Mining Company, with a capital of a million dollars, nominally. Of the fact that gold abounds within the colony, experts have no doubt; but, as is elsewhere the case, Nature opposes many difficulties to the collection of the precious metal. Diamonds have been found in British Guiana, but not as yet of any solid commercial value.

The question between Great Britain and Venezuela as to the boundaries of British Guiana is not unknown in the United States. It was touched upon in the *Nation* when Mr. Rodway's first two volumes were discussed. In the third volume of his work the author gives a chapter to the subject. He deplores the short-sightedness of the colonists of a previous generation, who, in 1840, declined to contribute half the expense of a survey which the British Government had employed Sir Robert Schomburgk to make, with a view to define the colony's boundaries. At a subsequent date, a geological survey of the colony, towards which the British Government gave a grant in aid, was discontinued at the instance of the colonial legislators. "It was the old story," says Mr. Rodway: "unless practical results were obtained at once, the thing was no good, and the expense unwarrantable." The maps compiled by the geologists who made the survey are now much sought after.

The fair city of Georgetown, the capital and chief port of the colony, has a chapter to itself. The development of Georgetown from its germ, the little hamlet of Stabroek, first projected by the British during their occupation of the then Dutch colony in 1781, and actually begun by the French during their occupation in 1782, and then continued and carried out by the Dutch when the colony was restored to them, down to the Georgetown of to-day, with its 55,000 inhabitants, is shown with clearness. For a sub-tropical city, Georgetown is quite up to date. Lying five feet below the sea's level at high-water mark, sanitary measures have effected so much as to make the town a fairly healthy place. With its broad streets, crossing one another at right angles, and its numerous private residences adorned with trees and plants of various shapes and colors, there is much to please the eye of a visitor. In business matters there is much to show that colonists keep abreast with the times. Overhead, numerous wires span the wide streets, for telegraphic, telephonic, and electric-lighting purposes. Sixpenny telegrams were in vogue in British Guiana before they were adopted in the United Kingdom; and the addresses are not charged by the colonial post-office. The citizens of Georgetown rejoice in a day-and-night telephone service, and they use gas or the electric light in their houses, as they prefer. The city itself is lighted in both ways. Ice is not only imported from Boston and Maine, but is manufactured in the colony. With ice selling at one cent for two pounds, the inhabitants of British Guiana are able to have cold water, which is now held to be a necessary of existence, always on hand. There are two cathedrals in Georgetown and two public gardens. In one respect at least the postal administration is ahead of that of many a larger place, for letters posted in the city for delivery within go for a one-cent postage rate. Needless to say that Georgetown has its firm of universal providers, in the shape of "The Great Demerara Supply Stores." That this enterprising business establishment has a nice respect for the veracities may be gathered from one of its recent advertisements in a Georgetown newspaper. Therein, after declaring its "popular prices for every article," and "everything fresh and up to date," these public benefactors include in their tempting list of goods on sale, "Hatchets, same as used by George Washington, 64 cents each."

That a history such as Mr. Rodway's should have been printed and published in a tropical colony with less than 300,000 inhabitants, most of whom are of the humbler classes, is highly to the credit of Mr. James Thomson, the proprietor of the "Argosy" Press, whose enterprise in this matter must be regarded as a public service done to British Guiana.

B. F. Stevens's Facsimiles of Manuscripts in European Archives relating to America. 1773-1783. Vol. XXI. Nos. 1814 to 1860. London. April, 1894.

BEFORE approaching the more important contents of the opening volume in the third decade of this great work, it seems a fitting moment to speak once more in praise of the performance as it advances towards completion. Not only is the interesting character of the documents fully maintained—though rarely some paper is offered whose presence could be spared—but there is no discernible falling off in the quality of the paper, or in the well-nigh faultless execution (in facsimiles) of the originals, and of the clear and beautifully written translations. The technical effect is brilliant and stately, a thorough and careful piece of workmanship. Until this monument is done it will be difficult to appreciate the significance of seemingly unrelated portions, but a word of commendation is not out of place at any time, and it is a pleasure to give it.

Vol. 21 closes as it opens, with Vergennes still trying to make Spanish and French diplomacy run in double harness; but, with all the great minister's astuteness, he finds Florida Blanca decidedly offish, especially so because D'Aranda at Paris is favoring almost with enthusiasm the French rather than the Spanish home policy. The documents to and from Vergennes and Montmorin are too long and too intricate for elucidation, but their theme is simple and their logic irresistible except to the Spanish King and his irritated minister, who show an almost impious unwillingness to see that Providence is pointing the way for the houses of Bourbon to join forces against the common foe. In forestalling any prestige which England may gain with America, by themselves treating definitely, though secretly, with the Deputies, the two crowns necessarily commit the colonies to a furtherance of their own interests in the New World. It is not easy to determine how sincere Vergennes was in thinking that the natural relationship between the mother country and her revolted colonies was likely to prove deeper than any temporary animosities between them; but it is reasonably certain that, to his mind, everything hung upon the way in which English opinion would swing after the assembling of Parliament. Should the North ministry or its successor decide to grant all concessions short of actual independence, or should it waive that last obstacle, there was, in his mind, only one policy for France—to act with promptness and to render any English overtures impossible by treaties of alliance and of commerce. He will induce Spain, if persuasion and gentleness can do it, but he makes it clear that France will pursue her course in any event.

The evidence offered in a detached way throughout these documents makes it difficult to say just what caused the procrastination of the Spanish court. The wounded pride of Florida Blanca at finding himself pushed by a foreign minister of only coequal power with himself towards accepting a course of conduct repugnant to his sovereign's moral judgment and to his own *amour propre*, is certainly a possible explanation. The only strong excuse freely sent back to the repeated messages from Versailles through the French ambassador was that the Spanish fleet would be in danger should England learn of any such provocation as a treaty with America. Vergennes in answer gives ample assurance that the fleet shall be rendered secure, but the most that can be elicited in return is the vague promise that should war actually ensue, Spain will not refuse to bear her share in it.

Before the volume closes, that happens (though we get no definite facts as yet) which is a common matter of history: the United States and France, on February 6, 1778, enter into two treaties, one of alliance and one of commerce. Stormont repeats a rumor of the event on the same day to Weymouth (No. 1857). Antecedent to this, but in close connection with it, comes document No. 1831, which deserves careful attention. It is Monsieur Gérard's "Narrative of a conference with the American commissioners," on January 9. It shows how cautiously the steps towards a definite conclusion were taken. Flattering to national pride is this untouched "negative" of our comparatively unsophisticated deputies, calmly and cleverly playing the game of statecraft, with three great Powers and thirteen colonies in the pool.

Let us turn from this side of the picture to Lord Stormont, still pertinaciously and hopelessly representing a fast losing cause. His complaints are the same, though deeper and

louder, that France is acting out a perfidious policy. The phrase pleases him if nothing else does. His work is so nearly done that it would be unprofitable now to describe it minutely. Just one success is vouchsafed to him when he reduces his great adversary, the French Minister of Foreign Affairs, to absolute speechlessness. Stormont, after the Queen's ball of January 21, when he hears that twenty-one French ships of the line are to be put into commission at once, goes to Vergennes and asks him of this news, then questions him point-blank as to the truth of rumors concerning the treaties with America. Stormont writes to Weymouth, "He seemed more embarrassed than ever I remember him, plaid with his fingers, and remained quite silent" (No. 1846). Vergennes himself, in a letter to Noailles (No. 1848), relates this interview very accurately, but explains, more lamely than is his wont, his silence on the ground that he cannot speak without first knowing the pleasure of the King.

How did Stormont get his intelligence of the treaties so soon and so accurately? France had used every effort to preserve the secret, at least while Spain was still so coy. Of the two treaties, that of commerce, if made public, was the least calculated to work mischief, but secrecy for both was most desirable. A little later, February 6 (No. 1858), Stormont speaks of a new source of information, "Mr. James," who wishes "to shew his Regard for Great Britain by giving useful intelligence, for which He expects a handsome acknowledgment"; and as an earnest "a gratification of Fourscore or a hundred Guineas" is suggested for the worthy fellow. It was not probably this "Mr. James" who revealed the treaties, nor could it easily have been the engaging Paul Wentworth, who, seriously annoyed at the intrusion upon his privacy of persons connected with the French secret service, had taken alarm and called on M. Favier on January 11 (No. 1833), clad "in top boots and frock coat," to say good-bye, and to make a final proposition that Favier should form a fourth in a partnership for speculation. The correspondence is to relate only to the operations in the money market, but the Frenchman refuses on the ground of having no exclusive information. "I would not even see you, nor have any correspondence with you, even for commissions for razors, English beer, peppermint-water, pickled salmon, and lottery tickets; in a word, I could know nothing certain except through some confidence which I should not care to abuse." After this positive answer the two parted cordially, and, so far as is to be seen, Mr. Wentworth withdrew from Paris, grieved as he said (No. 1832) at the "inefaceable unpleasantness of having been taken for a spy."

No. 1837, which does not bear the name of the writer or of the person to whom it was addressed, although Le Ray de Chaumont may have received it, reveals an attempt on the part of some partisan of England to induce France to "sell out" the colonies, by forming a commercial union with her ancient enemy. The writer maintains that no one in France rightly understands the theories of commerce. The desire to propitiate must have been active to induce him to say: "I am persuaded that if France, in the present conjuncture, treated openly and in good faith with Great Britain, she would obtain all that would contribute towards establishing peace on a solid basis." Unenthusiastic as the French King often showed himself to be towards America, he was not likely to be beguiled in this way, so long as Vergennes alertly stood between his master and the indifferentism of Maurepas. That, by the way, was a wise saw which, in a letter to Montmorin (No. 1847), Vergennes says that he once learned from M. Chauvelin, Keeper of the Seals, that "the whole science of politics was concentrated in the two words *foresee* and *forestall.*'

From Edinburgh to the Antarctic. By W. G. Burn Murdoch. With a chapter by W. S. Bruce. Longmans, Green & Co. 1894. 8vo, pp. xii, 364. Illustrated.

THOSE interested in Polar exploration and adventure have long known Dundee as a Scotch New Bedford, from which many whale-ships hail. The brothers Gray, masters and owners of such craft, have even an international reputation. Yet evil days have come for the whaling industry. Their prey, taught by experience, lurks in inaccessible recesses of the ice, or has been so reduced in numbers as to make the pursuit unprofitable. Whalebone of the better sort has risen in value until five dollars a pound has been named in the quotations. One right whale carries in his mouth a ton of baleen, while the oil pays the freight. This is a little fortune, and two or three whales will pay for a voyage. But in Spitzbergen Seas, Baffin's Bay, and the North Atlantic region generally even the two or three can no longer be had. The Dundee masters do not like long voyages, and have become so domesticated that they feel defrauded if they cannot winter at home. But something had to be done, or the business would come to an end.

Whalemen are prone to legend, and their "yarns" are proverbial. There is always a lost bay where the young whales are born and oily millions are basking in security behind a protective line of sand and breakers, waiting for the lucky master who shall again discover the hidden inlet. In a certain latitude, longitude uncertain, so-and-so has sighted an enormous school of sperm-whales, very shy, with a diabolical faculty of eluding the boats and disappearing in the fog. However, by proper means, something might be done even with them, if all else failed. Then there is the long-lost island in the North Pacific where the fur-seals winter, reported in the last century by a Russian boat crew driven far from land by storms, with no instruments but a compass, and finally reaching Kadiak by a miracle. Even last year a vessel sailed in search of this mythical island, as many have done before, seeking the goddess Fortuna in the bewildering fogs and murderous southeasters of the Eastern Ocean.

In an unguarded moment Sir James Ross referred to some whales seen in Erebus and Terror Gulf, during his antarctic expedition of 1842, as "right whales." This expression was recalled by the Dundee whaling-masters when their arctic work no longer prospered. In 1891 a voyage to the antarctic was mooted, but came to nothing. In the following year Mr. Kinnes succeeded in enlisting capital in the project, and four whale-ships, the barks *Balæna*, *Diana*, *Active*, and *Polar Star*, were outfitted. The largest, the *Balæna*, registered 260 tons, with a 65-horse-power auxiliary engine. The fleet agreed to rendezvous in the South Shetlands, where Ross's whales were to be sought for. The Royal Geographical and Meteorological Societies were naturally interested in the project, and contributed instruments for scientific observation; while some public-spirited individuals arranged that the ships' surgeons should be men of scientific tastes, supplied with the necessary equipment for doing incidental scientific work. The surgeon of the *Balæna*, Dr. Bruce, and a young artist who signed articles as surgeon's assistant, at a shilling a month, with no advance, are the authors of this volume.

To sum up briefly the commercial results of the expedition, no right whales were found, though "finbacks" abounded; but the vessels turned their attention to sealing, came home "full," and made a prosperous voyage. The *Balæna* left Dundee in September, 1892, and reached the Falkland Islands on the 8th of December. She arrived in the South Shetlands early in January, 1893, started on her homeward voyage February 18, and reached Dundee on the 30th of May. It would seem from the text that the commander of the *Balæna* was not favorably inclined towards the scientific utilization of the voyage. That his men should work on Sunday all day and well into the night killing and flenching seals was "a wark o' necesseety," but making "picturrs on the Lord's Day o' Rest is an awfu' like thing." Nevertheless, in spite of obstacles, hardships, and deprivations, something was accomplished.

The South Shetlands were probably first sighted by Dirck Gerritz in 1599, but were first made known by William Smith in 1818, while Graham Land beyond them was discovered by Biscoe in 1832. They were surveyed by Ross in his remarkable antarctic expedition of 1842–43, and the subsequent progress of discovery has been in the line of unimportant if useful detail. The Dundee fleet added almost nothing to the chart, but a Norwegian ship which they met, the *Jason*, Capt. Larsen, traced the eastern shore of Graham Land to 68° south, noting two active volcanoes which he called Mt. Jason and Mt. Sarsee. The same mariner brought from Seymour Island, fossil shells and coniferous wood, of Tertiary age, the first relics of this sort which have been obtained from the antarctic lands. These show, of course, that a warmer climate once prevailed there.

The *Active* determined the insularity of Joinville Land by passing through a strait previously unknown. The climate of the region showed remarkable uniformity; the temperature averaged during the whole of their stay about one degree below the freezing-point, this in the height of the antarctic summer. The lowest was 21 degrees, the highest 38 degrees Fahrenheit. Except where too steep for snow to lie, the land was wholly ice-bound, and no land vegetation of any sort is reported. The seals, which insured the commercial success of the voyage, were of four kinds, all peculiar to the antarctic region: two sea-leopards (*Stenorhynchus leptonyx* and *S. weddellii*), the white crab-eating seal (*S. carcinophagus*), and Ross's seal. Unused to man, they made no attempt to escape. Their slaughter was indiscriminate and painful to witness. An examination showed their stomachs to contain fish, crustaceans, an occasional penguin, and "ballast" in the shape of small stones. Some of the arctic pinnipeds also are known to take in "ballast." Birds were plentiful, especially the penguins; about twenty species in all were recognized, including the Cape pigeon, smaller albatross, and the sheathbill, or *Chionis*. The comical antics of the penguins were a never-ending source of amusement. Taxidermists as well as ordinary readers may find profit in the study of the spirited and characteristic sketches by Mr. Murdoch, which give a very different idea of the penguin from the specimens usually found in museums.

The aspect of antarctic ice is notably differ-

ent from that of the arctic regions. Huge table topped vertical-sided bergs are the rule, and the irregular pinnacled ice of the north is seldom represented. The beauty of color and grandeur of form were the admiration and the despair of our artist, who endeavors to paint in words, not without success, some of the marvels he found beyond the powers of his brush.

Much of the book is naturally devoted to the voyage and the stay at the Falklands, the latter impressing Mr. Murdoch more favorably than they did Darwin. Altogether, unfamiliar scenes are agreeably depicted; and if the artist's sketches have suffered somewhat in "processing," they still lend much of interest to the text. The maps are excellent, but there is no index.

From the Greeks to Darwin: An Outline of the Development of the Evolution Idea. By Henry Fairfield Osborn, Sc.D. (Columbia University Biological Series.—I.) Macmillan & Co. 1894. 8vo, pp. 259.

THIS is an attempt to determine the history of Evolution, its development and that of its elements, and the indebtedness of modern to earlier investigators. The book is a valuable contribution; it will do a great deal of good in disseminating more accurate ideas of the accomplishments of the present as compared with the past, and in broadening the views of such as have confined themselves too closely to the recent or to specialties. Through philosophy, history, theology, and general literature, the author has extended his search to the remotest suggestions. His account is connected and well written; it contains many a surprise for those who, working without backward glances, have taken zoölogical science to be a concern only of to-day. Nearly all of our theories are in some way followed back to the oldest speculations. The aquatic origin of life and the germ of Evolution are traced to Thales and Anaximander, spontaneous generation to Xenophanes, natural selection to Empedocles, adaptation to Democritus, pangenesis to Hippocrates and Heraclitus, and so on. Indebtedness to the ancients, as also what is owed to the later Bacon, Buffon, Lamarck, and many others of the series reaching to the present time, is set forth in a manner that will go far toward modifying prevalent estimates of the proportions of noted authorities. To be entirely complete, the discussion should include Inorganic Evolution.

The point of view is conservative; consequently, while it appeals to the larger circle of readers, this work may not satisfy radicals of either of the so-called modern schools. The conclusions are mainly personal, and are subject to changes by others. It will be questioned whether the influence of the ancients has not been estimated too highly, and too often imagined to exist. The basis of modern methods is traced to the philosophers, but the true basis of the science of nature lies in the things themselves, and they suggest the methods. Distinctions should be made between the probabilities of influence from the purely speculative, and coincidences arising from the study of the same objects; direct influence, in addition to the historical connection, existing in the one case and not in the other. In coincidence of conclusions on natural objects between a later writer and an earlier, again, the probabilities of direct influence may be said to be greater if both are wrong than if both are right. Whether points like these have had sufficient consideration in this work must be determined by subsequent studies.

The author's three stages in the discovery of a law of nature are, "first, that of dim suggestion in pure speculation, with eyes closed to facts; second, that of clear statement as a tentative or working hypothesis in an explanation of certain facts; and finally, the proof or demonstration." Preferably, the first stage should be observation, the second comparison and speculation. Science has suffered too much from statements of what is seen with eyes closed to the facts. Working hypotheses should not be valued so high, especially if they are theories not formed by the student himself. They may lead to brilliant thought, but are mostly unproductive of valuable results. Most of the early investigators too readily left observation for guesswork, and, once entangled in "working hypotheses," never again freed themselves. That Cuvier, when he left his objective studies for speculation, was exceptionally unsound, is very true, but it is equally true that his retarding influence was most felt through the adoption of his conclusions as working hypotheses by his followers. The author says (p. 9): "Young Darwin was among the few who kept before his mind [their minds] both theories." "There were but two theories to choose from, the special-creation theory and the transmutation theory. He took them up with an open mind" (p. 232). Darwin's statement (p. 234) is: "I worked on true Baconian principles, and, without any theory, collected facts on a wholesale scale, more especially with respect to domesticated products, by printed inquiries, by conversation with skilful breeders and gardeners, and by extensive reading."

It is in the approach to the present time that we notice in our author a slight lack of proportion. A final estimate of Darwin as compared with his predecessors is hardly possible while standing so near. The valuation of his service in the overthrow of the theory of special creations is fair; that of his special theories has the appearance of a compromise. The fact of survival is much less acceptable as proof of fitness than twenty years ago, and the tendency is to question, in definite application, the notion that "the less fit have perished," as thoroughly as we should question, say, the notion that "the progeny of the less fit, from the greater strain exerted upon the parents by the modifying agents, are the more adaptable." Hence it is evident that we are not yet prepared for accurate appreciation.

As a whole the book is admirable. The author has been more impartial than any of those who have, in part, anticipated him in the same line of work.

George William Curtis. By Edward Cary. [American Men of Letters.] Boston: Houghton, Mifflin & Co. 1894.

INASMUCH as Mr. Cary's personal approach to Mr. Curtis was from the side of politics and reform, while political journalism is his own vocation, it was to be expected that his book would be more satisfactory on this side than on that of literature pure and simple. Nevertheless, if the work is anywhere preëminently good, it is in the chapters that concern those years when Mr. Curtis was writing the 'Nile Notes' and 'The Howadji in Syria,' 'The Potiphar Papers' and 'Prue and I.' Nowhere a mere eulogist, Mr. Cary's discrimination between 'The Potiphar Papers' and 'Prue and I' is clear and fine, and, a little later, his indication of the failure of 'Trumps,' and the circumstances and habits that contributed to that failure, is as frank as the most candid critic could desire.

Both on his father's and his mother's side Mr. Curtis's ancestry is traced back to the first settlement of New England. The first Curtis brought over a certificate of his conformity to the Church of England and of his being "no subsidy man"; wherein the seekers for ingenious parallels will find one with the most distinguished of the line. The Curtis of Revolutionary times was a stiff-necked Tory of Worcester, Mass., who made his peace with the local patriots in 1777. Mr. Curtis's brother Burrill, whose death bas just been announced, furnishes valuable pages about their parents and their boarding at Brook Farm. Another informant represents George as seeming twenty-five when he was only eighteen, "with courteous recognition of others' convictions and even prejudices, and never a personal animosity of any kind"—phrases descriptive of his later and his latest years. At this time there was a singular maturity in his letters written to his father, of which Mr. Cary gives a few admirable examples. He saw and heard Webster at Bunker Hill in 1843, and took his measure pretty well for a boy of nineteen summers: "Too great for party; not yet great enough for quiet independence." A letter of 1844 calmly contemplates disunion as the outcome of slavery aggression, and argues its advisability. This and other letters of the same period indicate that Mr. Curtis's anti-slavery enthusiasm in 1856 was not so new-born as it has heretofore appeared; that he was in the van before he went abroad, but that three years of travel and the subsequent literary engrossment meant a certain arrest of his anti-slavery development.

The chapter on the Howadji books is interesting on more than one account. Compared with earlier writing in Curtis's journal and elsewhere, their style is artificial—a sympathetic adaptation to the Oriental theme. There is little indication of his learning how to write. The leading characteristics of his style appear in things he wrote while yet a boy, but it was chastened and subdued as time went on. The relations of father and son come out clearly in a letter written in 1851, when the 'Nile Notes' had been publicly reproved upon the score of immorality, and the father had been grieved at what seemed too much excuse for the assault. A mingled deference and independence is the prevailing note, though the latter may be in the ascendant when "the Howadji" says: "Had I written a book to please you, I would not have published it, because it would not have pleased myself. . . . The essential spirit of the book is precisely what I wish it." Something of the violence with which Mr. Curtis lashed out in the 'Potiphar Papers' is due, perhaps, to the spasm of virtue which his 'Nile Notes' excited in "the best society" of New York in 1851. A number of letters to Charles F. Briggs reflect the humors of his experience in the lecture field, and the buoyancy of his spirits while he was at once lecturing, writing books, and contributing to the papers and the magazines. We do not seem to find as full an account as we should like of the scope of Mr. Curtis's lectures. Such a one as that of 1859 on "Modern Infidelity," which he delivered to forty two lyceums in one winter, marks indelibly the force of his appeal to private reason from any authority whatsoever, and one craves some mention of it as an illustration of Mr. Curtis's religious thought, and his publication of it without the least equivocation or disguise.

Coming to the dreadful winter of 1860–'1, we

find Mr. Curtis with Horace Greeley, John A. Andrew, and many others contemplating disunion as the ideal solution of the crisis, in case the South declined to yield her claims. This attitude was so common among the Republican leaders that it is not to be wondered at in any particular case, but it is certainly surprising to find Mr. Curtis warmly approving (much more warmly than Whittier) Seward's speech of January, 1861. For that speech certainly did betray the anti-slavery principles in a most gross and miserable fashion—surrendering the Territories to slavery or freedom as one or the other might be voted up or down, and proposing an unalterable amendment to the Constitution prohibiting national interference with slavery in the States. The war once found inevitable, Mr. Curtis bent all his energies to shaping it into an instrument for the destruction of slavery. There are many beautiful letters in the book; there is no other so beautiful as that written just after the death of Lincoln, nor is it possible to read it without "a great trembling of the heart." In the chapter on Mr. Curtis's connection with *Harper's Weekly* we have the criticism of an editor on an editor, and it is the more valuable on this account. His editorial style was not that of his essays or orations. It was a talking style:

"He seemed to have his reader as clearly in his mind as if he were sitting before him, and he reasoned with him, appealed to him, suggested to him, as he would have done had their eyes met. And the editor did not make the mistake of either overrating or underrating the person to whom he addressed himself. I have sometimes thought that this imaginary companion was conceived by him with a very serious reference to the character of the *Weekly* as it was when he took charge of it, and that his typical reader was one who primarily liked to look at pictures, and whose interest, thus attracted, was to be directed by the writer."

Arriving at Mr. Curtis's connection with civil-service reform, Mr. Cary is in closer sympathy with his subject than at any other point. He bears new and valuable testimony to the sound, practical, common-sense dealing of Mr. Curtis with the whole business. The political reaction of 1874 and 1876, so closely following on the great Republican victory of 1872, was no whit in excess of his anticipation. The Hayes-Tilden electoral commission was his original device for solving the problem; but how he relished the purely partisan character of the decision we are left in doubt. In the spring of 1877 Hayes offered him his choice of the great foreign missions, but his lack of legal training was a bar to his acceptance of any of them, together with his fear of doing a less influential work. His break with Conkling followed soon, and then in 1884 the more signal one with Blaine and the Republican party. We are duly shown what long and ample preparation there was for the course which he eventually pursued. The utter silliness and immorality of those who hold each member of a convention bound to support the action of the majority, do not, perhaps, deserve attention, but there is a letter (p. 291) which may be commended to the victims of such gross illusion. Moreover, we are reminded that a motion for such a construction failed in the convention, those favoring it withdrawing it in face of Mr. Curtis's vigorous opposition, as if they dared not put it to the test. The reasons for his support of Mr. Cleveland in 1888 are summarized very carefully in a letter to some stranger who had written him a letter of friendly criticism and disapproval.

Of Mr. Curtis's more personal and private life, his tastes, his friendships, his domestic life, his religious attitude, Mr. Cary has written with brevity and reserve, but with a discriminating touch. Taking his book as a whole, those must have known Mr. Curtis extremely long and well whose good opinion of him is not enhanced by this entirely simple and sincere portrayal of his character and his career.

Among Men and Horses. By M. Horace Hayes, F.R.C.V.S. Illustrated by reproductions from photographs. London: T. Fisher Unwin; New York: Dodd, Mead & Co.

Captain Hayes was born in the County of Cork. He was three years a cadet at Woolwich, went to India and became a captain in "The Buffs." He has been a voluminous writer on horsy and veterinary topics and is a good and recognized authority. This book is a rambling record of his very active life in all parts of the world. It is very readable, and its interest is enhanced by much that is instructive, for Captain Hayes knows his Horse well, and he has appreciated the phases of human nature with which his peculiar experiences have brought him in contact. Like most of his class, he has a somewhat obscure notion of the line of demarcation between the sportsman and the sporting man, but his instincts tend to the better side. He says that "in the vast majority of cases the ordinary Englishman's love for horses is more love for gambling. If this were not so, we would find that horse-shows would be better attended than race-meetings. . . We all know that racing cannot be carried on without betting. . . . 'What I likes about racing,' said a young so-called sporting publican, who was a devoted student of the turf from a 'tape' and 'price-list' point of view, 'is to see my two "quid" coming into the straight, a dozen lengths in front of everything, and all the rest pulling up.'" The author has, nevertheless, the racing man's admiration for a good bettor, as for example: "Cremorne beat him by a short head. . . . 'What difference does that make to you?' said some one to George Payne. 'A hundred thousand, my boy,' coolly remarked dear old George, as serene as the moon."

He describes himself as "knocking about at race-meetings with all sorts of sporting characters, getting up boxing and athletic matches and other 'divarsions' dear to the heart of an Irishman." But he had a more serious and a more serviceable side, and he has done a great deal for the horse and for horse-owners. His books, 'Points of the Horse,' 'Veterinary Notes for Horse-Owners,' and 'Illustrated Horse-Breaking,' are capital. He devised a system of breaking which seems to be of more general application than Rarey's; and with his wife, who rode the reformed brutes the minute they left his hand, he made the tour of the colonial world, giving lessons and public exhibitions, and getting material for some of the most entertaining portions of his book.

As to Buffalo Bill's buckjumpers, he says:

"If any of these animals really did buck, which I rather doubt, it was in the feeble manner which might have been expected from 'trick' horses which had to do their 'turn' twice a day for months, if not for years. Besides, buckjumping is a vice which no horse will continually practise unless he receives the frequent encouragement of throwing his man off. The cowboys seem hard, active, fearless fellows, with whom it would be more pleasant to drink than to fight. No comparison can be drawn between their riding and ours, as the two styles are entirely different. Whether their bronchos buck or only pigjump, the feat of sticking on them is not very difficult when it is allowable to use a saddle of about fifty pounds in weight, and to hold on to it with one or both hands. The size and shape of their saddle are no doubt regulated to attain comfort in their hard work, and not merely to enable them to stick on. Had they practice in our saddles and in our methods, they would no doubt acquit themselves creditably, like the fine fellows they are."

He is very sensible on the subject of giving water to a heated horse:

"Applying the golden rule of treating a horse as I would wish myself to be treated, I introduced in India, many years ago, the practice of giving a horse in training a fairly liberal drink of water, immediately after he had done his work, before sending him back to his stable—and with the happiest results. By my example and writings, I destroyed, in India, the old and cruel myth of a drink of water being dangerous to the health of a heated horse; supposing, of course, that the water was not too cold. Take, for instance, a man who is exhausted and streaming with perspiration after doing some violent work. What, may I ask, is the first thing he does? 'Takes a drink, if he can get it,' you naturally reply. And after he has had his whiskey and soda, glass of beer or shandy-gaff, cup of tea or glass of water, what does he say? 'By Jove! that has done me a power of good,' or words to that effect, you answer. Right again, my reader, and so would your horse say, under similar circumstances, were he able to speak. But I fancy I hear you observe that even horses have been known to drop dead from taking a drink when they were hot. Such instances, I admit, have undoubtedly occurred; but only when the imbibed fluid was comparatively cold, in which cases it caused death by nervous shock. The precaution of slightly warming the water, or of giving it only in small and repeated quantities, is not difficult to adopt."

In connection with training, he says:

"The easiest way to get down weight—without resorting to the continued use of medicine, which cannot help being injurious to the health—is that of abstaining from taking any fluid during meals, and for, say, an hour and a half after meals; no restriction being placed on its consumption before meals, so long as the one and a half hours' interval after them is observed. This I found very efficacious; but could not continue it, as it brought on rheumatism, on account, I presume, of the food being presented to the organs of digestion in too concentrated a form. A large amount of fluid is certainly required by the systems of most persons, to, so to speak, wash out the tissues and thus to prevent the deposition in them of deleterious products, the presence of which is apt to give rise to rheumatism and other untoward results."

Suggestive quotations might be extended ad libitum. In fact, there are few better books for the odd moments of one who has an interest in horses and horsy things.

Le Vatican, les Papes et la Civilisation; Le Gouvernement Central de l'Église. Paris: Didot; New York: Dyrsen & Pfeiffer. 1895. 4to.

Even the presses of Didot have not often favored the public with a more sumptuous volume than this. Few subjects offer so rich a field for the illustrator as the central church and palace which epitomize the history of Latin Christianity in all its vicissitudes, and on which the piety and wealth of Europe have lavished all the treasures of art. For the worthy treatment of so attractive a theme the resources of the illustrator have been taxed to the utmost. Engravings and chromos, woodcuts and process cuts, have been employed in profusion, and he will be hard to please who does not find here what will satisfy his curiosity if untravelled, or recall pleasant memories if he has been fortunate enough to stand under the Dome of St. Peter's and wander through the loggie and library of the Vati-

can. Everything is here depicted, from the archaic seal of Pope Anaclet to the *fin de-siècle* face of Cardinal Gibbons; from epigraphs in the catacombs to frescoes of Giotto and Raffaele and sculptures of Michelangelo and Canova; from delicious alleys and parterres in the gardens to the secret apartments of the Conclave; from the shrewd, intellectual countenance of Leo XIII. to groups of his officials and servitors, his Swiss Guard and Noble Guard.

There is also much to interest in the text, though it is scarce to be reckoned worthy of the illustrations. It is true that we have an introduction by Cardinal Bourret and an epilogue by the Vicomte de Vogüé, while the body of the work has been contributed by three former members of the French School in Rome, who are evidently thoroughly familiar with their subject. The first 233 pages are occupied by a general view of the history of the papacy by M. Georges Goyau, which may be summarized as an eloquent *plaidoyer* in justification of the Syllabus of 1864. All the mediæval claims of the Church are assumed to be its inalienable rights, however obscured by the Cæsarism of the Christian Emperors and the irreligion of modern godless generations. Luther, Zwingli, and Calvin, we are told, "claim to maintain a religion, and they claim that this religion was a branch of Christianity." As for science, the writer complains that after the Reformation "it ceased to accept as postulates the dogmas revealed by Christ or taught by the Church. . . . If it came across them and found them true, it adopted these communications of God. God had to allow himself to be surprised, *flagrante delicto*, in material exactitude."

Of course from an essay written in this spirit there is not much to be learned except the curious recrudescence of mediævalism which the Holy See is stimulating with some success. Of greater value is the second essay, also by M. Goyau, on the central government of the Church, giving us an inside view of the organization and machinery through which the two hundred millions of the Roman obedience are spiritually governed. Of the vastness and intricacy of this business a glimpse can be had from the single fact that the archives of the Datary, from the accession of Martin V., in 1317, to Pius VII., contain 6,690 volumes of supplications addressed to the Pope for benefices and for dispensations to marry within the prohibited degrees. The third section is by M. André Pératé, and is entitled "The Popes and the Arts." In the space of about a hundred pages it gives us an interesting sketch of the patronage of art in the papal court, and its influence on the artistic development of Europe. Finally, another hundred pages, by M. Paul Fabre, describes the Vatican Library and its vast accumulations of literary and historical treasures, which the enlightened liberality of Leo XIII. has thrown open to scholars of all nations and creeds. In the paragraphs, however, devoted to the library under Pius IX., M. Fabre preserves a discreet and significant silence with regard to its most industrious and illustrious custodian, Augustin Theiner.

Yet, after all, in turning over the pages of this splendid book, the thought awakened by its ostentatious display of the magnificence of the papal court and its surroundings is, what Jesus of Nazareth, if He returned to earth in his humble guise, would think of his representative, and what his representative would think of Him.

As a Matter of Course. By Annie Payson Call. Boston: Robert̀s Brothers. 1894. Pp. 125.

JUDGING by Miss Call's title, her book might be a novel by Howells, but in reality it is a treatise on mental hygiene, big by reason of the importance of its stuff, even if small in the number of its pages. They that are whole need not a physician; but they that are making themselves whole can find no better ally than the author of this unpretending volume. In her previous work, 'Power through Repose,' Miss Call preached the gospel of muscular relaxation to her countrymen; here it is the gospel of mental relaxation. Both gospels are needed by our people sorely; but few realize the unnatural state of "contraction" of every sort in which they live, and a special grace from on high is usually needed to reveal to us that there is a way out, so simple and near-lying that to overlook it would seem impossible, save for the fact that the very tension and pressure and hurly-burly in which we live in our prison close the valves of the opening to so narrow a crack that we roll over and over it without perceiving it to be there. To ignore things, to be willing that they should take their course, to let go our hold on them and on ourselves, and throw overboard a good lot of our supposed higher consciousness—these sound in one sense like immoral maxims, and for some people they would be immoral maxims, but to the over-tense and over-careful and irritated type of spirit they are the only outlet to a wholesome moral life.

The merit of Miss Call's book is in inducting the reader into this philosophy in detail. We might give extracts, but out of their context and place in the general argument they would probably sound more trivial than they are in the book, so to cite would be unfair. Moreover, Miss Call's style shines more by sincerity and plainness than by rhetorical ability. Her book, had it a little more brilliancy, might well take a place with us similar to that which Feuchtersleben's 'Diätetik der Seele' has held in Germany, and go through edition after edition. This would seem only natural in a work which must meet the exact need of so many persons, and of which the quality is so peculiarly real and penetrating and the humanity so rare.

BOOKS OF THE WEEK.

Alarcón, P. A. de. El Final de Norma. W. R. Jenkins. 75 cents.
A New Gospel of Labor. Seattle, Wash.: S. Wegener. 50 cents.
A Selection from Child Life in Poetry. Boston: Houghton, Mifflin & Co. 15 cents.
A Selection from Child Life in Prose. Boston: Houghton, Mifflin & Co. 15 cents.
Baldry, Alfred L. Albert Moore, his Life and Works. London: George Bell & Sons; New York: Macmillan. $22.50.
Baring-Gould, S. Noémi. Appletons. $1.
Beazley, C. R. Prince Henry the Navigator. Putnams. $1.50.
Bercy, Paul. Lectures Faciles pour l'Étude du Français. W. R. Jenkins. 30 cents.
Bernard, V. F. L'Art d'Intéresser en Classe. W. R. Jenkins. 30 cents.
Bhikshu, Subhadra. A Buddhist Catechism. Putnams. $1.
Bowyer, J. T. The Pollinctor. Richmond, Va.: J. W. Randolph & Co. 50 cents.
Bradford, Dr. T. L. The Life and Letters of Dr. Samuel Hahnemann. Philadelphia: Boericke & Tafel. $3.50.
Bridges, Robert. Milton's Prosody. Oxford: Clarendon Press; New York: Macmillan. 40 cents.
Butcher, Prof. S. H. Aristotle's Theory of Poetry and Fine Art. With a Critical Text and a Translation of the Poetics. Macmillan. $3.25.
Call, R. E. The Life and Writings of Rafinesque. [Filson Club Publications.] Louisville: J. P. Morton & Co.
Callaway, Prof. Morgan. Select Poems of Sidney Lanier. Scribners. $1.
Chesney, Gen. Sir George. Indian Polity: A View of the System of Administration in India. 3d ed. Longmans, Green & Co. $6.
Cornwell, W. C. The Currency and the Banking Law of the Dominion of Canada. Putnams. 75 cents.
Corson, Prof. Hiram. The Aims of Literary Study. Macmillan. 75 cents.
Cowan, Prof. Henry. Landmarks of Church History to the Reformation. London: A. & C. Black; New York: A. D. F. Randolph & Co. 30 cents.
Crockett, S. R. The Stickit Minister. M. J. Ivers & Co. 25 cents.
Croquet, C. P. du. La Conversation des Enfants. W. R. Jenkins. 75 cents.
Crawford, F. M. The Ralstons. 2 vols. Macmillan. $2.
Cunningham, Prof W., and McArthur, Ellen A. Outlines of English Industrial History. Macmillan. $1.50.
Dallas, Mary K. Biltry. Merriam Co.
D'Alviella, Count Goblet. Emile de Laveleye: Sa Vie et son Œuvre. Paris: Félix Alcan.
Davis, Rev. J. D. A Sketch of the Life of Rev. Joseph Hardy Neesima. F. H. Revell Co. $1.
Donisthorpe, Wordsworth. Law in a Free State. Macmillan. $2.
De Witt, D. M. The Judicial Murder of Mary E. Surratt. Baltimore: John Murphy & Co.
Dickens, Charles. Little Dorrit. Macmillan. $1.
Douglas, Miss Amanda M. In Wild-Rose Time. Boston: Lee & Shepard. $1.50.
Evans, Mrs. Elizabeth E. Transplanted Manners: A Novel. London: Swan Sonnenschein & Co.
Furneaux, W. Butterflies and Moths (British). Longmans, Green & Co. $3.50.
Garden and Forest, 1894. *Garden and Forest* Publishing Co.
Geikie, Prof. James. The Great Ice Age. Third edition, largely rewritten. Appletons. $7.50.
Gestefeld, Ursula N. The Leprosy of Miriam. Gestefeld Library and Publishing Co. $1.25.
Grant, Rev. G. M. Religions of the World in relation to Christianity. London: A. & C. Black; New York: A. D. F. Randolph & Co. 30 cents.
Green, Anna K. The Doctor, his Wife and the Clock. Putnams. 50 cents.
Hazell's Annual for 1895. London: Hazell, Watson & Viney; New York: Scribners. $1.50.
Hinds, A. B. The Making of the England of Elizabeth. Macmillan. 90 cents.
Horne, C. F. Great Men and Famous Women. Illustrated. 2 vols. Selmar Hess.
Howell, George. A Handy-Book of the Labor Laws. 3d ed., revised. Macmillan. $1.50.
Howells, W. D. A Traveller from Altruria. Harpers. 50 cents.
Hyslop, Prof. J. H. The Elements of Logic, Theoretical and Practical. 2d ed. Scribners. $2.50.
Larned, Augusta. In Woods and Fields. Putnams. $1.
Larned, J. N. History for Ready Reference. Vol. IV. Nicæa to Tunis. Springfield, Mass.; C. A. Nichols Co.
Lear, Edward. Nonsense Songs and Stories. Ninth and revised edition. Frederick Warne & Co. $1.25.
Lee, C. H. A Vindication of Arthur Lee. Richmond, Va.: J. W. Randolph & Co.
Martin, G. H. The Evolution of the Massachusetts Public School System. Appletons. $1.50.
Mills, Rev. B. F. God's World, and Other Sermons. F. H. Revell Co. $1.25.
Noire, Ludwig. On the Origin of Language and the Logos Theory. Chicago: *Open Court* Publishing Co. 15 cents.

Waiting at Table. By a Member of the Aristocracy. Frederick Warne & Co. 60 cents.
Wolff, H. W. Odd Bits of History. Longmans, Green & Co. $2.75.
Wright, Rev. John. Early Bibles of America. 3d ed., revised and enlarged. Whittaker. $3.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 14, 1895.

The Week.

THE defeat of the Springer bill in the House by twenty-seven majority was not entirely unexpected. That its defeat was due in part to the ill-timed efforts of ex-Speaker Reed to introduce a little politics in the national finances seems to be clear. If Mr. Reed had given a hearty support to the bill, it cannot be doubted that he would have carried at least fourteen Republican votes which were cast in the negative, and this change would have saved the bill. The main point to secure was the provision making the bonds payable in gold. That the House was really in favor of this was shown by the vote on the proposed amendment of Mr. Bell to add the words "or silver," so that the bonds should be paid in either silver or gold. This was a crucial test, and the House voted it down by a decisive majority. But after this proof had been given of the sanity of the House the bill was killed by politics, and for this Mr. Reed is largely responsible. The Reed substitute would have been the next best thing after the defeat of the Springer bill, but the vote had to be taken on the substitute first. Of course the friends of the Springer bill could not vote to kill their own measure in advance by adopting the substitute. The Democrats as a party will have to take the penalty of non-action in the financial crisis, which the President so impressively brought to their attention, but there are many Republican members who ought to be severely dealt with, because better things are expected from them than from the Democrats. If they had taken the high position that they took on the Sherman repeal bill, the Springer bill would have been passed by a decisive majority.

The President's communication to Congress on the subject of the $65,000,000 gold loan leaves very little to be said in the way of comment. It is all embraced in the fact that the lenders of the money ask 3 per cent. interest if the loan is made payable specifically in gold, but otherwise 3¾ per cent. It is very easy to say that all Government bonds have been paid in gold, and therefore all of them will be so paid, whether that word is used in the law or not. The lenders think that there is some risk, and they measure it by ¾ of one per cent. They are one of the parties to a bargain and the Government is another. The two meet on an equal footing. If the Government prefers to pay $16,000,000 more than is necessary for the use of the money rather than pronounce the word "gold," it is at liberty to do so, of course, but the spectacle will be the most humiliating, in a financial sense, that the world ever saw. Even the foolish State of Idaho knows better than this. So also does Arizona. This is a case where all the members of the community are individually sane but collectively mad. Each one knows how to carry on his private business, but is *non-compos* as regards the public business. The chances are, however, that the House, when brought face to face with the gold clause unencumbered with any other question, will adopt it by a good majority. What may be done by a Senate as incapable as the present one, no man can predict.

The President says that he has made this loan in pursuance of section 3700 of the revised statutes, which reads as follows:

> "The secretary of the treasury may purchase coin with any of the bonds or notes of the United States authorized by law, at such rates and upon such terms as he may deem most advantageous to the public interest."

This law was first enacted in 1862, being a part of the war measures of that period, but, having been reënacted in 1874 as a part of the revised statutes, it has received the stamp of permanence. Its existence appears to have been overlooked until now. It supplies any defect, if there were any before, in the chain of title by which these bonds and the previous ones have been issued. The discovery of these latent powers, or something else, has produced a remarkable "flop" in the editorial department of the *Sun*, which now applauds President Cleveland to the skies for his masterly handling of the national finances. Even the *Tribune*, which has been a harder case than the *Sun* during the late troubles, is now moved to say:

> "The President announces a new loan; and although the rate of interest is higher than was expected, he is entitled to much praise for having thus protected the national honor, at this or any other price. He had to deal with a Congress which, as its votes proved, was inclined to prefer national bankruptcy. That disaster, at least, the President has averted, and if an impartial criticism must attribute to him a large share of the danger, it must also give him without stint the credit for averting it. He most unwisely involved the country, but he has honorably adopted the only method of relief."

The horror and dismay of the New England Senators at the news that the Hawaiian Government is taking itself so seriously as to condemn revolutionists against it to death, are partly comic, partly pathetic. They exploded so violently over the barbarity and heathenism of the Queen, when she talked of having the heads of some traitors, that to find the heroic missionary republic following her wicked example leaves them in a ridiculous plight. Yet they make it plain that their chief concern is neither humanity nor self-consistency, but a fear that all their fine annexation plans may be upset. Senator Hale did not conceal his distress over the prospect that "the almost universal sentiment of the American people in favor of the existing Government in Hawaii" would take a dangerous turn if the Missionaries' Sons took to hanging Americans. The Jingoes have evidently never regarded the Hawaiian Government as a real government. It was a good-enough stopgap, a simulacrum of government, to last till they got their hands on the country. But they have talked so nobly about the pure republicanism and devotion of the self-perpetuating oligarchy now in power in the islands, have raged with such a show of deadly fury against the royalists, that the Missionaries' Sons came to think they couldn't better fire the American Jingo heart than by dealing out death to royalist traitors. The poor fellows never dreamed that they would be upsetting the whole kettle of fish.

If such cases of illegal arrest and arbitrary imprisonment and secret deportation as have been going on in Hawaii had occurred under a royalist government, we should have known what adjectives to apply to them. If an attorney-general serving under a miserable queen had gone into the prison where his victims were and sworn at them profusely, we should have taken it as a matter of course; but what shall we say when the chief prosecutor of a missionary republic falls to swearing like a pirate? These things are a sore affliction to the patriots at Washington, and they know not what to say except that Cleveland and Gresham have a terrible responsibility to bear for this business. The Hartford *Post* severely rebukes the Administration for the "ridiculous haste and eagerness to lay before Congress information which is likely to reflect upon the humane character of the Provisional Government." It does look like an affront, we must admit. The true course would have been to suppress Willis's despatches and deny the accuracy of the press news. That would have given the patriots time to turn round. As it is, they are comfortless, since England continues in brutal indifference to all that goes on in Hawaii. An inquiry at the Foreign Office on Saturday as to what would be done about the Englishman sentenced to death in Honolulu, brought the answer that nothing would be done. Not a ship sent, gun fired, or flag hoisted! How long will Americans endure these repeated insults?

The precious Senate rules were delightfully in evidence on Saturday. All the parliamentarians were agreed that Senate rule

xvi. was absolutely fatal to the incorporation of the Hawaiian cable amendment in the consular and diplomatic bill. But Senator Manderson cynically said that the "principal merit of the rules is that we can so quickly get rid of them when we desire," and so the Vice-President obligingly put it to the Senate whether the amendment was in order. It was voted, 36 to 25, that it was, and away went the rules. But they came back a moment later in full dignity. Senator Lodge proposed his consular-reform bill as an amendment to the same act. This certainly appeared as "germane" to a consular and diplomatic bill as a $3,000,000 cable line. But no, it was "new legislation," and a chorus of voices called for its rigid exclusion. The rules revived and the Lodge bill died.

Senator Hawley and others having referred in terms of extravagant praise to Senator Morgan's "luminous and wonderful" speech on the cable amendment, we turned with aroused anticipations to Saturday's *Congressional Record*, where the speech was printed in full. We agree with Senator Hawley that it was wonderful. It was even fearful and wonderful. Never were such moving truths uttered about "the focal point of the sea-power of the Pacific," never was more eloquently set forth the infernal power of Britain, not only "to dictate a gold policy to President Cleveland and our Government," but to deceive the very elect in America. The Alabama Senator is not fooled, however. He sees through the tricks and twists of British diplomacy. The other Jingoes, even the Jingo editors, have confessed, by their dead silence, that they were baffled by England's giving up her Mosquito protectorate. But Morgan sees through it unerringly. It means, he says, that "they have abandoned all hope and expectation of getting control of the transit through the Isthmus of Darien for a ship canal," and are starting "a quiet movement" for a Hawaiian cable "which will give them, largely, the control of the Pacific Ocean." Of course, if a cable will give control of the Pacific Ocean, it is cheap at $3,000,000, or $30,000,000, and no wonder the Senate voted to build it, after this luminous and wonderful demonstration, rules or no rules.

The Senate debate on the Hawaiian cable will go far towards restoring the reputation of that body for logic and statesmanship. No one can read it without gaining a wholly new view of the functions and possibilities of an ocean cable. Captain Mahan will have to revise his next edition, and explain, with the Republican Senators, how a cable, if only one end of it is on American soil, can make entirely nugatory the biggest fleet the British can collect anywhere along its line or at the other end. We must say, however, that Senator Palmer took unfair advantage of Senator Morgan in asking him, the chairman of the committee on foreign relations, by what cable lines despatches were now sent to our fleet in Chinese waters. Mr. Morgan said he did not know, thus delicately implying that state secrets could not be given away like that. Senator Sherman took occasion to deal a blow at England, wiping out on his bare assertion her cable connection with Australia, which, he said, did not exist. But, of course, men whose heads are full of war and naval strategy and annexing islands, and being great and glorious, cannot be expected to know the wretched details of the location of submarine telegraph lines.

It is an interesting fact that there are no States whose bankers cling more firmly to the gold standard than those which send to the Senate and House silver Senators and Representatives. Congressman Bryan of Nebraska has always been one of the loudest advocates of free coinage, but, during the recent financial flurry, the bankers of Omaha hoarded gold until they had nearly $3,000,000 of the metal locked up in their vaults. So, too, the bankers of Denver were among the worst gold misers in the country during the panic of 1893, when Senators Teller and Wolcott were sounding the praises of silver. It is not "Wall Street" or "the money power of the East" alone that clings to the money standard of the civilized world. Wherever there is an organization of business men whose commercial relations bring them into touch with the laws of trade, the financial lunatics and demagogues find a force resisting them which they cannot afford to disregard. Senator Vest of Missouri has already discovered that he made a bad blunder when he ridiculed the attitude of the trade organizations of his State in his recent speech.

Wherever the Populists secure control of a State on pledges of "reform," they proceed to outdo the old parties in extravagance and corruption. The new Populist-Republican Legislature in North Carolina, whose members were voluble on the stump last fall about the hordes of needless office-holders, began work by employing a much larger number of doorkeepers, laborers, and other attendants than was ever known before. Gov. Tillman's successor in South Carolina reports that nearly all the officials in charge of dispensaries in that State, under the new liquor law established by Tillman, are behind with their accounts, some of them in considerable sums. The Populist administration in Kansas went out in a cloud of scandals, its management of the benevolent institutions having been particularly disgraceful. The new Republican officials in Colorado found that a lot of furniture belonging to the State had been stolen by the Populists, and the Populist superintendent of education has been forced to confess to petty stealings by false entries in his expense account. Third parties have usually made a pretty bad showing for their brief existence, but we have never had anything to compare with the record of "the People's party" during the last four years.

The "dressed-stone law," passed by the last New York Legislature, is one of the most perfect specimens of Labor legislation seen in many a day. It requires that all stone of any description used in State or municipal works within this State shall be "worked, dressed, or carved on the grounds where such works are being carried on, or within the boundaries of the State, or within the boundaries of the municipality." The effect of this is to increase the cost of all public works using stone from 20 to 100 per cent. The cost of repaving Avenue A, it was discovered by the city authorities, would be increased $200,000 because of the requirement, and the work has been postponed in consequence. The rapid-transit commissioners say, if the law is not repealed it will be necessary for them to use brick instead of stone in constructing the proposed underground road. For some kinds of stone-cutting there are no facilities in the city, and special works would have to be established. Of course, the effect of the law is to increase the burdens of the laboring classes by increasing taxation, and at the same time there is not more but less work for the stone-cutters, for the enormously increased expense compels contractors to abandon a great deal of work which they would otherwise undertake. Yet in spite of all this it is very difficult to get support at Albany for a bill repealing the law. Fear of the Labor vote is so potent that nobody ventures to take up the case vigorously, and unless some powerful pressure is brought to bear upon the members, the absurd law will stand.

Col. Waring's replies to the questions and requests of the Drivers' and Hostlers' Union of his department were frank and to the point in all cases, but they were especially so in reference to two subjects of vital importance in the discipline of the street-cleaning force. The union asked him to do away with the "irresponsible spies" whom the former commissioner had employed, and Col. Waring replied that instead of abolishing this system he proposed to "extend it very largely," because "unfortunately there are many men among the drivers of ash-carts who cannot be trusted to do their duty, to keep out of liquor-saloons, or to take proper care of their horses." The union also asked him "to stamp out the merciless system of blackmail which is practised upon employees by superiors," and Col. Waring replied that he should do this "in the most relentless manner, remitting no effort to rid the service of every officer who has been guilty of the crime indicated." The employees ought to be satisfied with these

conditions. The spy system will serve to drive out of the service all the shirkers and incompetents, and the abolition of blackmail, which undoubtedly was almost universal under Brennan and Andrews, will give to every man on the force every penny that his own labor earns. Hardly a man of the old force was permitted to receive his full pay. Some of it was taken out by a boss, or a district leader, or some Tammany man with a "pull," before it reached his hand. If Col. Waring can stop this infamous but regular Tammany business, he will confer upon the laborers of his force a far greater boon than any other that they could ask.

A "symposium" on what is styled "the strife between labor and capital" appeared in last week's *Independent*, but the careful reader will not feel that he has gained much from its perusal. Bishop Huntington thinks that there should be a definite contract between the employer and the employed, and that "the contract should include a promise by both parties to abide by the award of a board of arbitration." But the Brooklyn strike has again illustrated the familiar fact that even a superior class of laborers, like the linemen, will not keep any of their promises. Brother Hollister of the New Lebanon Shakers has a great many partial remedies, among them a restriction of the rate of interest, prohibition of the liquor traffic, minority representation, and the issue by the Government of full legal-tender notes "sufficient to pay its debts"; but his "best and only complete remedy is for people to act from love of the neighbor, in lieu of supreme love to self." Bishop Newman thinks highly of profit-sharing for the laborer, but his "sympathies are not limited to the working classes," and go out to "the capitalist in his palace spending a sleepless night thinking how he can meet the obligations of the morrow"; and he comfortably concludes that the solution is not in trades-unions, arbitration, or legislation, "but in brotherly sympathy, common honesty, and to do as one would be done by." Rabbi Schlesinger of Chicago holds that "the coming solution of the social strife can be nothing else but religion," while the Rev. W. W. Fenn of the same city has great faith in boards of arbitration and conciliation. "The spirit of altruism," says a Baptist minister of Pittsfield, Mass.; "Establish the kingdom of heaven," says an Episcopal clergyman of Tacoma, Washington; "Arbitration is the simplest and most promising means," according to Cardinal Gibbons of Baltimore. President Eliot of Harvard makes the humiliating confession that he has little idea what the solution is going to be, but his impression is that "this strife, which has been developing for hundreds of years, will be removed only by gradual processes in operation through hundreds of years." Henry George humorously concludes the "symposium" by advertising his nostrum: "The only possible solution of what is called the social strife between capital and labor is the single tax."

The English ministry have opened Parliament with a very formidable programme, which will meet with obstinate resistance. Not to speak of home rule, their neglect of which has cost them the loss of the Parnellite votes, they are to disestablish the Welsh church, to "control" the liquor traffic, to abolish plural voting and to provide for the payment by the state of the expenses of elections, to unify the metropolis, and to arrange some mode of reinstating the evicted tenants in Ireland. The speech makes no mention of the reform of the Lords, but Lord Rosebery said a resolution on that subject would be introduced in the Commons by and by. It is safe to say that no part of this programme can be carried out, except the Irish evicted-tenants bill, on which both parties have agreed or nearly agreed. Every other bill will be certainly defeated in the Lords. The Welsh church fights with the English church at its back, and, in spite of Welsh fierceness, will make a desperate defence, and the plural vote has a powerful and yearly increasing number, even of "the philosophical Radicals," among its defenders. Property is more and more alarmed by numbers. All parties, however, will enjoy having election expenses paid by the Government. There was no mention of Irish home rule in the Queen's speech, but there will undoubtedly be much mention of it when Redmond settles down to work. On the whole, the thing which seems most likely is dissolution in the early spring, a Conservative triumph, the reception of Chamberlain into the Conservative fold with a seat in the cabinet and a peerage in the near by-and-by, and a strong Socialist programme to keep the masses quiet. In this field both parties are running a vigorous race, with the Conservatives slightly ahead.

We have more than once had occasion to point out a special advantage that Paris has to offer to the student of politics in having, within easy distance, so complete an exemplification of the delights of socialistic municipal government as is to be seen any day in the commune of St.-Denis. Just as the naturalist, or the animal-painter, may spend his mornings at the Jardin d'Acclimatation in the study of foxes or wolves, so the youthful publicist may go out to St.-Denis and watch the Socialists, uncaged and free as in a jungle, and so all the more fit to be observed. The present régime has lasted for three years. At the elections in 1892 the Republicans were so badly split into groups that they elected only eight members of the Municipal Council, while the Socialists won twenty-four seats, although they were in a minority. In order to demonstrate the fact that this was so, the Republican members of the Council, together with two repenting Socialists, resigned and sought reëlection, in the hope that, when the truth of the matter should appear, the Municipal Council would be dissolved by the prefecture of the Seine. They were reëlected by a large majority, resigned again and again, and were sent back each time by an ever-increasing number of votes. The prefecture of the Seine, however, has, so far, paid no attention to this demonstration of the electors, and the Municipal Council of St.-Denis remains undissolved, with the Socialists in full sway.

It has been, on the whole, a shade less grasping than Tammany—partly, perhaps, because there was less in sight to grasp—and it has indulged in priest-baiting, but otherwise its course has been of a sort to remind one of Tammany at every turn. Perhaps in some ways St.-Denis has surpassed the methods of the Wigwam. To seize upon the public charity fund, and distribute it secretly to individuals in order to promote strikes, was a fine touch. So also was the masterly management of the sinking-fund, which was muddled away completely, and the treasury emptied, so that a new loan of two millions of francs was required. But perhaps the very finest stroke of all was the instant resort to McKinley methods by the Council as soon as the public chest was empty. They began to double up the *octroi* all around. It is true that these taxes fell heaviest on the poor, as the councillors themselves admitted, but they fancied that, being indirect, they would not be felt.

The two big Chinese ironclads *Chen-Yuen* and *Ting-Yuen* have been sunk off Wei-Hai-Wei. These are the ships that escaped with little damage in the Yalu sea-fight, thereby giving so much comfort to Secretary Herbert. Wanting to build four such men-of-war himself, it was pleasant to point out, as he did in his annual report, that they had shown themselves invulnerable. He argued powerfully that it would never do to trust to cruisers, which might go to the bottom from a single shot. We must have some big fellows, like the Chinese ships, that could take a terrible pounding without harm. But the big fellows have now gone to join the little fellows at the bottom of the sea. Let no one imagine, however, that this affects the argument. What is the use, as Franklin said, of being a reasonable being if you cannot invent a reason for what you are bent on doing? That the Chinese battleships were not sunk in the Yalu fight was a convincing reason why we should have some like them. If anything were lacking to make the argument complete, it is now furnished by the sinking of the same ships. We are sure that we are only anticipating the logic of the forthcoming debate in the House on the proposition to build four new battle-ships, at $4,000,000 each.

THE OUTLOOK FOR SOUND MONEY.

THE silver-men had nothing to felicitate themselves upon in the voting on the Springer bill last Thursday, but they take great comfort in contemplating the Senate. A canvass of the voting strength of fiat money in that noble body was made and given out the week before, with the result that forty-eight Senators were for silver, or something equally bad, while but thirty-nine were for the money of the business and civilized world. With the changes in personnel since made and to be made, the preponderance of fifty-cent-dollar Senators will be even greater in the next Senate. We presume it is necessary to concede that a majority of ten to twelve can be reckoned upon as mulish opponents of sound financial legislation, even if not as reckless advocates of a depreciated currency. The silver-men are in great glee over this showing. They point back to the time when the repeal of the Sherman law was forced through the Senate by a majority of eleven, and assert that they are now stronger than they then were by at least twenty votes. These figures and claims cannot be disputed, yet the inference the silver-men make, namely, that this country is going to a silver basis, can be successfully disputed, and that by an analysis of the very voting strength which they boast of in the Senate.

According to the canvass made, which is no doubt reasonably accurate, the States, voting by their representatives in the Senate, stand as follows on the question of bonds and currency frankly payable in gold:

For.	Against.
Maine,	Alabama,
New Hampshire,	Arkansas,
Vermont,	California,
Massachusetts,	Colorado,
Connecticut,	Florida,
Rhode Island,	Georgia,
New York,	Idaho,
New Jersey,	Indiana,
Pennsylvania,	Kansas,
Delaware,	Missouri,
Maryland,	Mississippi,
Ohio,	Montana,
Michigan,	Nevada,
Illinois,	North Carolina,
Iowa,	North Dakota,
Minnesota,	South Carolina,
Wisconsin—17.	South Dakota,
	Tennessee,
	Virginia,
	Washington,
	Wyoming—21.

Six States—Kentucky, Louisiana, Nebraska, Oregon, Texas, and West Virginia—must be set down as doubtful, inasmuch as their Senators were, and doubtless will remain, divided, one for and one against.

This looks black enough, but we must not stop here. Further inquiries will show that the forces which ultimately make the laws and settle things in this country are enormously against the silverites and cheap-money men of all descriptions. Take the test of population. The seventeen States ready to go unequivocally and finally to the gold standard contain 34,415,000 inhabitants. In the twenty-one opposing States there are but 22,522,000. Now in the long run numbers count in this country. Preponderating numbers killed slavery, and will kill bad money. The majority rules, ultimately, even in the Senate. The Senate was once the stronghold of slavery just as it is now the stronghold of cheap money. What made the cheeks of Calhoun and Davis blanch, as they faced the future, was the swelling population of the free States. In that they saw the doom of slavery, and the 12,000,000 margin of population now in favor of honest money means, in like manner, the doom of a depreciated currency.

The test of wealth shows a preponderance still more striking in favor of sound currency. According to the census returns, the seventeen States which stand for a stable standard of value report capital of all kinds amounting to $5,065,000,000; the twenty-one opposing States return but $943,000,000. Can it be imagined that four-fifths of the property of any country would allow itself to be imperilled and cut in two in value at the demand of one-fifth? The thing is unthinkable. In fact, this great preponderating mass of property has already taken sure precautions against being caught in that way. Legislation may inconvenience and harass it, but cannot despoil it, as long as there are courts to enforce contracts. One of the cheering omens for the future is the fact that State after State in the West is learning the lesson that every blow they deliver at the security of property or the standard of value hurts them more than the hated capitalists they aim at. Whatever may be said about the weakened rights of property, it is still the strongest force in the political world. That it is so overpoweringly against degraded currency is pledge sufficient that the country will continue to be against it.

The political test, finally, is as encouraging to the friends of sound money as either of the others. The 17 States firm for the gold standard cast 223 electoral votes. The 21 others cast but 167, leaving 54 doubtful. Moreover, politically speaking, it is impossible to combine even those 167 electoral votes in any one party column, or for any one Presidential candidate. One-quarter of them is Republican, and may, in desperation, "flock by itself," as the silver Republicans threaten that it will, but cannot mix with the three-quarters Democratic. If the latter undertakes to absorb the Republican one-quarter, it will find itself whittled down to one-quarter or less. On the other hand, if the sound-money Republicanism of the East and North goes after the silver idols, it will lose the East and North in the act. What will it profit the Republican party to get the thirty-six electoral votes of the silver States, and lose as many in New York alone, to say nothing of the hundred or so that would be lost elsewhere? As the thing stands now, a sound-money President has a clear majority in the electoral college, and no other kind of a President can possibly get a majority in it. This is the strategic fact for the business world to tie to. It is also the fact for the Republican managers to tie to. Any alliance with the silver Republicans which means wavering for a hair's breadth on the money question, will be as fatal as an alliance with the Populists. The country, tried by every test, is for honest money, and any party that wants to carry the country must be for honest money.

THE CONGRESSIONAL REMEDY FOR RAILROAD STRIKES.

WE have now before us the bill pending in Congress for the regulation of the relations between railroad corporations and their employees. It is really a bill providing for voluntary arbitration, the award of which is to be binding in law. Its object is to prevent the interruption of the carrier business by labor strikes, like those of last summer. It begins by providing that the wages of all employees of railroads "shall be just and reasonable." But it contains no definition of "just and reasonable," although this definition is what the world is seeking everywhere with strong crying and tears. Clearly what is just and reasonable in a prosperous road would be unjust and unreasonable in a struggling or non-paying one. Moreover, the pay-roll of a railroad is so large a proportion of its operating expenses that its adjustment is one of the most important and difficult branches of railroad management. In fact, the man who can say what it ought to be, is the man who should manage the road. If the arbitrators could decide it, the railroad companies would certainly entice them away from the position of arbitrators by the offer of large salaries. The matter is of small importance, however, because the bill provides no sanction for the payment of such wages. It merely expresses a pious opinion on the part of Congress as to what the rate of wages ought to be, in which every rational person will agree. It is very like saying that every railroad manager should be a just and pure man.

After the award is made and has become binding by being filed in the clerk's office in the district court, if the employees do not like it, what is the remedy? Here comes the crucial point of all this railroad legislation. Railroad service, as every one knows, is continuous, needs to be prompt, accurate, and cheerful, and to be performed by willing, faithful men. On no service in the country does the safety of so much life and property depend. Well, how are these dissatisfied employees to be compelled to render such service? How are they to be restrained from evincing their dissatisfaction by assaulting "scabs," tearing up rails, destroying bridges, and burn-

ing freight-houses? Why, by a suit in equity for specific performance. They are expressly forbidden after the award to leave their employment by reason of such dissatisfaction without giving thirty days' notice. But if an employee gives thirty days' notice, he may go—subject, however, to pursuit by the company in a chancery suit. If the company should wish to get rid of him, it must not discharge him without thirty days' notice also, and should he, during the pendency of the arbitration, "unite in, aid, or abet strikes or boycotts" against the company, it is to have its action against him "on the case" for damages. What with the chancery suit for specific performance, and the "action on the case" for damages, the strikers would have reason to tremble in their boots. The provisions forbidding the companies to restrain employees from joining labor organizations we need not comment on. With the powers both of the Court of Chancery and of the common-law "action on the case" at their disposal, what need they care about labor combinations?

The original bill, as compounded by Mr. McGann and the "labor committee," contained a section providing that, whenever a railroad strike became of such magnitude as to obstruct or prevent the operation of the road, the attorney-general was to file a bill in the Circuit Court praying for the appointment of a receiver, who was to take possession of the property during the strike, and operate it for the benefit, the bill did not say of whom. The defendants in the suit were to be not only the corporation and employees engaged on strike, but "all known corporations, organizations, or individuals participating therein, or aiding or abetting them." When the bill was submitted to the chiefs of the railroad organizations, conductors, firemen, locomotive engineers, trainmen, and railroad telegraphers, they asked for the erasure of this section in the following most sensible language:

> "We object to the provisions of section 10 of the original bill in their entirety. We believe that it covers ground not contemplated by the preceding provisions of the bill. We believe it can be eliminated without affecting in any way the intent or effect of this proposed law. But we feel that it could easily be construed in such a way as to entirely defeat the object aimed at. We believe that it contemplates investing the representatives of the general Government with authority which is not consistent with the accepted understanding of the rights of property-owners or individual citizens. In short, we look upon it as a long step in the direction of Government paternalism, or eventual Government ownership of railways, or, to use a briefer and stronger term, state socialism, pure and simple."

So we see that members of Congress are actually ready to outrun the labor organizations in attacks on property and private rights for the satisfaction of a class which has never yet made known its grievances in a peaceable, orderly manner. Section 10 might well have been drawn by a boy at school, so much indifference does it display to the complication of public and private interests which in great commercial communities inevitably grow up around every service rendered to the public, whether by the state or by individuals.

This whole problem of railroad labor contains but two questions: One is, Can any corporation concede the right of an employee to stay indefinitely in its service on terms fixed by himself and his fellows? Is it possible to carry on any business on that basis?

The other is, Does the law owe protection to the thousands who are eager for the work which strikers abandon? On what principle can it be denied them?

It is obviously easy enough to negotiate and come to terms with a peaceable, reasonable man; nearly all the business of life is done through such negotiations. If, however, one of the parties in most negotiations were certain, if you differed with him, to hit you over the head, break your furniture, and try to set fire to your house, negotiation would cease, and civilization would perish, and mediæval barbarism would resume its sway. In this railroad matter, the roads are really struggling for civilization against large bands of barbarous men, into whose hands our legislators and officials are all the while trying to deliver us, and to prevent their learning the very first lesson of civilized life, which is that no dispute must be settled by violence.

THE HAWAIIAN NEWS.

The calm with which the Hawaiian news of the Queen's abdication was received both here and in Washington caused the public genuine surprise. We expected it to throw the whole missionary community into the violent agitation with which all previous intelligence from the island had been received. But the *Tribune* dismissed it in a small perfunctory paragraph, and Lodge, Frye, Boutelle & Company, far from expending any "dust and sweat" on it, passed it over in a sort of mournful silence. Yet, rightly considered, it was the most important "triumph of the Gospel" yet achieved in the lands of the heathen. In fifty years or thereabouts the missionaries have not only converted the natives to Christianity, and witnessed the reduction of their numbers by one-half, but their Sons, aided by other believers, have got hold of about two-thirds of the land of the island, and all the fertile portion of it. The folly of leaving the natives in possession of the Government, after the property had passed into the hands of foreigners, then became apparent to the humblest white Christian in the place, and it was determined to dethrone the Queen. It would have been difficult to dethrone her for want of title, or on account of her color—or on account of the poor quality of her government, considering the quality of that of some of our own States. So it was determined to dethrone her for unchastity and heathen practices. But to do this it was necessary that somebody should commit treason and expose himself to the loss of his head. So it was decided to get the United States minister to join in a righteous conspiracy to persuade the Queen that it was the United States that was deposing her, and to land sailors for that purpose. Accordingly she surrendered, and the Christians turned to Washington to get themselves annexed, taking care to get there before the Queen's people and secure this great triumph of righteousness before they arrived. They did not secure annexation, but they were successful in setting up a God-fearing, chaste, and self-sacrificing republic, in which every man was to have his vote and every child his school, and all money was to be made by the sale of Sunday books and newspapers.

After a few months of this happy and holy régime, which the wicked Cleveland and the blundering Gresham tried to upset by diabolical negligences, plots, and ignorances, some of the natives determined to commit treason by an armed rising against this good missionary-and-sugar Government. They failed, as wicked men are apt to fail, and all fell into the hands of the Christian police, after a brief residence in the extinct crater of a volcano. Of the atrocity of their offence we can hardly trust ourselves to speak. To employ heathen violence to overthrow what Christian violence and fraud have set up, is almost a crime against human nature. These misguided men are being tried by court-martial, and how good it is of the Sons of the Missionaries to try them even by court-martial, or to try them at all. Instant execution by their captors would have been too good for them. Why should they be tried when taken with arms in their hands? The one good reason for trying them that we see is, that the proper punishment of treason, which is decapitation, may be inflicted on them in the public square. We can recall no case in which treason has been committed under such circumstances of aggravation. A rising against any established government is an awful crime, but what shall we say of a rising against a government of good, wise, chaste men, who seek nothing through their rule except the elevation of the natives and the triumph of the true religion?

The Queen, however, has done worse than commit treason. Gladly would we pass over without comment her last outrage on the republic, but we have a duty to perform, and we will perform it. She knew well—she must have known—that in claiming the crown and pretending to consider herself wrongfully deposed, she was rendering the only service in her power to the men who, for her sake and that of her people, have set up a republic in their midst. As a centre of monarchical and especially British intrigue, as a person for conspirators to rally round and restore to the throne, she knew well how important she was not only to the republic and to the New York *Tribune* but to Lodge, Frye, Boutelle & Co., who are doing "the

work of the world" in Washington. Knowing this, however, she has formally, and in her prison, surrounded by cocoanut bombs, *abdicated*. She has signed away all claim to the throne in the most formal manner. She has left no one to furnish a centre for monarchical or British intrigues. There is now no one for the rebels to rally round. No wonder the news has created no excitement in Hawaiian circles in this country. It is too atrocious an offence for anything but silent sorrow. It justifies everything that the Missionaries have said of this wicked, wicked woman. A week ago we would have protested against her execution for treason. We would have said that although, by both human and divine law, she merited the fate of Charles I., yet, considering how much milder manners have become during the last two hundred years, considering the clemency of our own treatment of Jefferson Davis and other rebels, a plea should be entered for a gentler punishment—say for perpetual imprisonment, or banishment to a Populist State. But now we have not a word to say against her execution. Let her be beheaded, and her blood be on her own head.

We would we could stop here, but if we are not greatly mistaken, Dole—President Dole of the republic, our own Dole—is also a traitor. He is advocating the cession of Neckar Island to a British telegraph company for a station for an ocean cable, although he knows well that the British Government would fortify it and keep a garrison in it, and thus "dominate" the whole group of islands. Why does he do this? Alas! The answer to this reveals only too clearly the degeneracy of the times. What reason but one can there be for his conduct? What does Senator Lodge think it is? What does the ancient poet say about the influence of gold on human conduct? What do the British maintain the gold standard for? Need we go further into this painful subject?

WASHINGTON'S PURCHASE OF BRADDOCK'S FIELD.

NEW YORK, February 4, 1895.

IT has hardly attracted the notice of historians that Washington was the owner of "Braddock's Field," though it is mentioned in the schedule attached to his will:

"Great Meadows, 234 [acres], $6 [price per acre], $1,404 [value]. This land is valuable on account of its local situation and other properties. It affords an exceeding good stand on Braddock's Road from Fort Cumberland to Pittsburgh, and besides a fertile soil possesses a large quantity of natural meadow fit for the scythe.—It is distinguished by the appellation of the Great Meadows, where the first action with the French in the year 1754 was fought."

Ford ('Writings of Washington,' ii., p. 288) quotes a sentence from a letter of Capt. William Crawford to Washington, December 6, 1770, which says: "Agreeable to your desire, I have bought the Great Meadows from Mr. Harrison for thirty pistoles, to be paid to Mr. Jacob Hite." (This was Lawrence Harrison, whose son married a daughter of Crawford.) It appears, however, that there was a hitch in the transaction, for on April 15, 1771, Crawford writes to Washington:

"I received yours of March 11th, and am much surprised at Mr. Brooks' behavior in regard to that land. He never had the least claim or pretensions to the Meadows that I ever heard of. Mr. Harrison made use of the name of 'Wm. Brooks,' expecting that Wm. Brooks, his son-in-law, would do him the favor to give him an assignment at any time; but, as Mr. Harrison has got a permit, there was no occasion for an assignment, or for an order of survey; for any surveyor would have surveyed the land on the permit and returned it into the office, which would have been accepted, while any order of survey that he could have got would not do. Inclosed you have a bond from Mr. Harrison for settling the matter and making good the title. He says if you want it done, it shall be returned in your own name as soon as the survey is completed. He will settle all disputes in regard to it. There is one William Brooks here who has agreed to sign the bill of sale, which is sufficient; as any man of that name will do as well as he, he having no claim or right any more than any other man of that name. Mr. Harrison says it is all he can do at present. Anything more that is requested he will do if required; and if not, the bargain must be void, and he have his papers again; as he can sell it immediately to several people who will pay no regard to Brooks' claim—looking upon it as worth nothing." (Butterfield's 'Washington and Crawford Letters,' Cincinnati, 1877.)

On December 6, 1771, Washington wrote to Crawford: "As soon as the tract at the Great Meadows is enlarged, I should be glad to have the surveys returned to the office, and to get a plat of it to myself, as I am determined to take out a patent for it immediately."

The original deed of "William Brooks" is now in the collection of Mr. W. F. Havemeyer, New York. The following is a literal copy:

"Know all men by these Presents that I, William Brooks of Fredrick County in Virginia have Bargaind sold and maid over unto Colo George Washington of Fairfax County in Virginia a sartain Tract or Parsel of Land Lying and being in Bedford County in Pensilvania on Braddock's rood, and known by the name of they Great Medows whare Colo Washington had a batle with the french and Enduns in they year one thousand seven Hundred and fifty four and they same which was Located by Law Harrison in the Proprietors of Pensilvania office in the name of Wm. Brooks

for the Consideration of the sum of five shillings to me in hand by Colo George Washington the recpt wherof I do hereby Ackneledge and my self there with fully satisfied and do from me my heirs Executors Admrs and Esigns for Ever worrent and Defind the said Described Tract of Land unto the said Colo George Washington his heirs Executors Admrs and Esigns in Witness Wherof Do hereby set my hand and seal this 7th day of Octobr one thousand seven hundred and seventy-one.

"Test— William Brooks. *Seal.*"
Marcus Stephenson
R Orthington
Jno Stephenson.

The two Stephensons, witnesses, were half-brothers of Crawford. The assignment, so curiously combining good and bad spelling, is in a different handwriting from that of either of the witnesses, or of the signer, William Brooks. At first glance it looks as if Braddock's Field, where Washington built Fort Necessity, and from which he retreated in 1754, had been recaptured by stratagem seventeen years later. As Crawford was a justice of the peace in the county (Bedford) where the land lay, Washington might easily defer to him as to the questionable legality of the transaction. It looks, too, as if Harrison's son-in-law, William Brooks, finding his name used in the original claim (perhaps to escape creditors of Harrison), had resolved to get ahead of his father-in-law by insisting on his (nominal) claim. But the dates must be considered. Between Crawford's letter of April 15 and Washington's letter of December 6 enough time had elapsed, even allowing for the slowness of communication, for the son-in-law to recede from his useless claim. There being no further reference to either Brooks in subsequent correspondence, it may be that the signature is that of the bona-fide Brooks.

There is little doubt that it was partly a purchase of sentiment. Washington had visited the place with his friend Dr. Craik, October 13, 1770, and it may have been then that he lost a silver seal, with his initials in monogram, found there by Daniel Boone Logan in 1842, which was restored to the family, and is now in the State Library at Albany, New York.

MONCURE D. CONWAY.

THE JAPANESE AND THE WAR.

TOKYO, January 12, 1895.

Now that China and Japan seem to be within measurable distance of peace, and to stand on better terms than at any time since the breaking out of hostilities, it is worth while reviewing some of the probable and actual results of the war upon the Japanese. What changes the war may produce upon the ultimate destinies of the East are at present impossible to foretell, but its influence upon the immediate temper of the Japanese people and upon the policy of the Government can be traced in many ways, and this influence must effect a permanent change in the country. Will the war prove a boon or a source of danger to this country, in spite of her victorious armies and navies?

In the first place Japan has scored a point in establishing, if not her sway, at least her methods of government, and, indeed, her civilization, in Corea. The whole programme of reform proposed by Count Inouye for the kingdom has perhaps more radical elements than Corea can learn to digest in a decade. There can be no doubt that the Coreans will benefit immensely if they accept these reforms and have sufficient capacity to carry them out. But it is more than likely that this whole programme, if it meets with success, will react upon the government of Japan. Count Inouye emphasizes the importance of establishing a responsible government in Corea; officials are to be held responsible for income and expenditure, and the heads of the ministries are to be answerable for the proper working of their departments. But it is not difficult to see that the popular parties in Japan will better the instruction, and use the same arguments against the Government in power in order to carry out their cherished scheme of government by party. As soon as Japan has once more quieted down, we may expect to see the old warfare between the Government and the popular parties break out in all its intensity.

Incidentally Japan has gained by the war what she has so long been struggling for, namely, the full recognition of foreign nations. Individually we may deplore the fact that she has gained her point by violence. But it is hardly fair for Western nations to point to Japan as the guilty party in this respect. In the most civilized countries of the West nothing better than war has been discovered to settle ultimately the disputes between nations, and success in the field of arms overrides all other forms of prestige. In the present struggle against China, Japan has obtained her full measure of eulogy, and even of adulation. Not twenty years of effort to promote commerce, industry, education, and justice have given her the standing among Western nations that

she has gained by the successful prosecution of a six months' campaign. There may be plenty of room for criticism in this state of things, but Japan, borrowing as she does her civilization from the West, can hardly be blamed if she borrows Western methods in their integrity.

The evil results of the war upon the country are not to be overlooked, and yet it is doubtful whether Japan has suffered more in this respect than any other nation would have under like circumstances. First and foremost we notice a tendency to brag and bluster in certain newspapers. One newspaper had it some time ago that Japan was the coming nation of the world, as the nations of Europe and America were already in their dotage. In another newspaper it was remarked that it was fortunate that Japan had attacked China rather than any European nation, as the latter must necessarily have yielded, like China, to the force of Japanese arms. Now and then the most silly and grandiose language is to be found regarding the future of the Japanese people, as though Japan had performed a miraculous feat in bringing China to terms. It is only fair, however, to point out that this is the talk of certain newspapers, presumably edited by very young men, and not the opinion of the more sober portion of the people or of the Government. The latter is fully aware what dangers beset the country, and how necessary it is at this crisis to exercise prudence and foresight.

In regard to the massacre at Port Arthur, little can be said to apologize for the conduct of the Japanese. It is indeed true that the Chinese treated all Japanese prisoners with every refinement of cruelty, and no one can blame the Japanese soldiers for the desire to take revenge upon their enemies on the day of the battle. But it is almost beyond dispute that the massacre was prolonged long after the feelings of the soldiers had cooled down and after Port Arthur was completely in the power of the Japanese. It is stated as an "open secret" that the massacre was perpetrated by the order of a particular general, whose name is given (Yamaji). Yet so far not a word has appeared in the Japanese press either in condemnation of or regret for the action. The great majority of the newspapers have adopted a defiant, we-are-no-worse-than-you tone, and have raked up passages in the annals of Western countries to show parallel instances. Other newspapers have still worse methods of defence. Says the *Jiyu* (*Radical*): "The Chinese refugees could easily procure garments to throw over their uniforms, thus instantly and easily transforming themselves into seemingly peaceful citizens. *Under these circumstances wholesale slaughter was necessarily the order of the day.*" The *Nichi-Nichi* (*Daily News*) ridicules the foreigners who find fault with the Japanese on this point. It calls them "mere imitators of Herbert Spencer, who lost his head in amazement at the immense number of killed and wounded in Napoleon's battles, and madly declaimed against the great European conqueror. War is by nature cruel. Circumstances must determine the number of lives lost." All this is rather melancholy reading in the light of the claims made by the Japanese previous to the attack on Port Arthur. Never were more definite orders issued not to injure the innocent or kill prisoners than those emanating from Marshal Oyama, who was in command. The massacre was perpetrated in the face of these orders, yet we find no one held answerable for disobedience, or a single sentence of disapproval in the press. If a guess could be hazarded at the real difficulty, it would be that the general responsible for the atrocity had acquired such popularity by his courage in various actions that his superior in command feared to stop him or censure him. The weakness of the present Government, too, is probably much greater than is suspected, and its only hope of success lies in following public sentiment as closely as possible.

The last point of importance is whether the present Government will conclude a peace on terms sufficiently generous to induce China to accept them. It is a vital point, not only to China, but to Japan herself, that the treaty should be concluded as soon as possible. I have already referred to the fact that the present Government of Japan has no political support whatever, but derives all its momentary strength from the circumstance that its war policy squares with the overwhelming sentiment of the country. There is still much bitter opposition to the Government, arising partly from the popular parties and partly from the extreme Satcho element, or, as it is commonly called, the military party. These two divisions represent the extreme tendencies in Japan to-day; and Count Ito's Government, which represents a conservative constitutionalism, is endeavoring to steer safely between the two extremes. The popular parties, however, who have no power in the Government outside of Parliament, where they are dominant, wish to establish party government at once, and are bitterly hostile to both Count Ito and the military party. The latter dominates the army and navy, and has but little regard for either the Constitution or the Parliament. Thus it becomes plain that if Count Ito makes a treaty that is not extremely favorable, he is sure to offend the military party, which then will probably succeed in overthrowing him, and ride to power on the tide of their recent military successes. On the contrary, should Count Ito not succeed in establishing peace, his position will gradually grow worse, as the military party will gain such power through the prolongation of the war that it can snap its fingers at his authority. Thus, whatever happens, whether peace is established or whether war continues, the present Government is but little likely to derive any advantage from either. Certainly Count Ito has won not a grain of gratitude from the country thus far through the war with China. All the gratitude has been lavished on the soldiers and individual leaders that have in some way distinguished themselves by courage or achievement.

From the point of view of Japan's general welfare it is of the greatest moment that peace should come quickly. At present Count Ito still commands the situation, and whatever he strongly and definitely recommends to the Emperor he can carry out. But let the war continue only six months longer, let the military party get control while war is still in progress, and it is hardly possible to foretell the consequences to Japan and to the entire East. All the European powers interested in the East might be drawn into the struggle, and then Count Ito would no longer have the restraining power which he now exercises. It is fortunate for Japan that she has so prudent a statesman at the helm. There can be no question of his sincere desire to put an end to the struggle as soon as possible. He sees the danger, to both himself and his country, of any further prolongation of the conflict; and while he will derive no particular credit from his successful conduct of the war, and may even become unpopular as soon as he concludes a treaty, yet any other course is fraught with even greater danger.

From these general outlines it will be seen that the war has not proved an unmixed blessing to Japan. Yet on the whole the benefits will probably outstrip the evils, and even to China the war may be a blessing in disguise. The utter corruption of the official class in China has been at last brought to light by her successive defeats as could have been possible in no other way. Like France under the Second Empire, China has been long suffering from internal dry-rot. It was the opinion, I believe, of Secretary Seward that "war is national discipline"; and if the present struggle should prove a goad to drive China out of her long lethargy, it would be an unexpected benefit not only to herself, but to the entire East.

G. D.

Correspondence.

A CLINCHER.

To the Editor of The Nation:

Sir: Mr. Cleveland's last letter seems to me one of the finest things done by any President since Abraham Lincoln. In a quiet and dignified manner he informs Congress that he has negotiated a loan on the basis of three and three-quarters per cent. interest, but that he has reserved the right to substitute a three per cent. bond at par, provided Congress will make it payable expressly in *gold* coin, and that the difference saved to the Treasury thereby, to the maturity of the bond, would be upwards of sixteen millions of dollars.

Of course there is not the slightest prospect that Congress will do anything of the sort. That is clear enough from the voting on the 8th, when, in the words of a correspondent, "the propositions of Republicans, Democrats, and Populists, of gold-men, silver-men, and greenback-men, all went down in the general *débâcle*." Yet it does not follow that the President is a greater man even than the average Congressman. It merely means that he is one man, representing the nation and feeling his responsibility, while the House of Representatives consists of 356 men, representing 356 equal fractions of the nation, and feeling no responsibility to anybody except the private and party interests which have placed them where they are.

A confidential financial agent of the President taking a part, which from his position must have been a leading one, in the debate on Friday would have served as what in chemistry is called a "precipitate." One thing is certain, that till some such step is taken, Congress will never do anything of any kind for good.

G. B.

Boston, February 9, 1895.

FORTUNES IN LAND.

To the Editor of The Nation:

Sir: In an editorial article in your issue of January 10, entitled "The Use of Great Fortunes," occurs this paragraph:

"But no income can come from large fortunes except through investment in some enterprise useful to the public, as is proved by the profits or interest; and the owner is apt to be a man skilful in finding out what the public wants, and therefore a good man to have control of large sums of money."

This remark, on the public advantage of frequent concentration of wealth in the hands of eminently successful men, is directed against a very prevalent and very important fallacy,

and it might, perhaps, have been given greater development, to the profit of many readers; but the form in which it appears, perhaps on account of the small space given to it, seems chargeable with error arising from the omission of a needed qualification.

In the interest of sound discussion, I would suggest that a very large exception to the general benefit arising from profitable investment of private fortunes is exhibited in the buying and holding of land. Leaving out all operations whereby bodies of real estate are brought to a better market by active enterprise, working through costly improvements, schemes of colonization or otherwise, we have still an enormous body of investment in which the money invested performs no public service, in which the investor's ability is exercised only in forecasting the probabilities of a rise in prices to which he does not propose to contribute. Only a reminder is needed of the great share which this sort of profit holds in the yearly increase of private fortunes in this country, and of the important modification hereby imposed on our view of the public beneficence of large private gains. It may be remarked, further, that this sort of investment is particularly hurtful through its direct interference with those active investments whose profits do indicate general advantage.

The answer to an inquiry about the source of a large fortune is apt to fall into two clauses. The first describes the useful activities by which ability first achieved success. The second gives the familiar explanation: "Then he invested in real estate." And too often the first success, earned by sound business service of the public, bears but a fractional ratio to the later gains, which have come from shrewdness so used as to benefit only the investor. And by the facility of the latter sort of profit a very great share of the most valuable business ability is diverted from useful activity, and so lost to the public.

The considerations here barely suggested must furnish a heavy item to the debit side of the account, when we undertake to sum up the beneficence of the present conditions of money-getting, and it seems to me important that advantages should be reckoned as nearly as possible at their real value, and drawbacks clearly acknowledged. E. S. THACHER.

NORDHOFF, CALIFORNIA, January 30, 1895.

[Interference with the use of land for business purposes is the only serious objection we see to the holding of large bodies of land for a rise. If it prevents better cultivation, or the erection of dwellings for producers, or of buildings for purposes of exchange or production, it is injurious. But how much of this is there? Very little, we are sure. As a rule, land enriches only the heirs of the original purchasers after having been held for long periods, and is sold for a price which does not cover interest, taxes, and assessments. Vastly more people in America are poor through holding land than rich through having held it. How capital is lost to the community through holding land for a rise, unless somebody wants it for productive purposes, we fail to see. And if anybody wants it for such purposes very badly, he almost always gets it, and the vendor is sure to put the money received for it into some profitable investment.—ED. NATION.]

WILLIAM AND MARY SIGNERS OF THE DECLARATION.

TO THE EDITOR OF THE NATION:

SIR: Will you permit a correction of Mr. Charles Forster Smith's letter on the subject of the "Influence of College-Bred Men," published in the *Nation* of January 31, 1895? He assigns to William and Mary College only three signers of the Declaration of Independence, viz., Thomas Jefferson, Carter Braxton, and George Wythe; whereas the college catalogue and Sanderson's Lives of the Signers call for five—Thomas Jefferson, Thomas Nelson, Benjamin Harrison, Carter Braxton, and George Wythe. But, in addition to this, William and Mary furnished the draughtsman of the paper, Thomas Jefferson, who surely was of more consequence than the large majority of the other signers.

It would seem from Mr. Smith's letter that William and Mary stood second or even third in the list of colleges affording a text for emphasizing the influence of college-bred men upon the origin of the Union. But she gave Peyton Randolph, first president of the Continental Congress; Thomas Jefferson, the draughtsman of the Declaration; Edmund Randolph, who proposed the first scheme of government for the Federal Convention in 1787; and John Tyler, who carried through the Virginia Legislature the first proposition calling the Annapolis Convention—the immediate predecessor of the celebrated convention at Philadelphia in 1787. One blast of Roderick Dhu's bugle-horn was "worth a thousand men"; and mere numbers can give no idea of the influence of a college.

Mr. Smith bases his deductions upon 'Appletons' Cyclopædia,' which does not mention that Nelson and Harrison were at William and Mary College. This was probably an oversight in the compilers of that work, but it may be said that the biographies of most Southern men in 'Appletons'' are open to objection. It may be also said, with truth, that thousands are omitted who are entitled to representation on the basis of the work. I do not blame the publishers for this, as their work is published in the North, and it was much easier for them to secure information of Northern men. Northern men of fourth or fifth-rate standing are noticed in 'Appletons',' while the South is fortunate to get representation as low as a third-rate person. I am sure there was nothing *intentional* in this.

I am truly yours, LYON G. TYLER.

WILLIAMSBURG, VA., February 6, 1895.

Notes.

ADDITIONAL announcements from Macmillan & Co. are 'The Paintings of Venice,' by Karl Károly; 'The Politics of Aristotle,' a revised text, with commentary, by Prof. Franz Susemihl and R. D. Hicks; Philo's 'About the Contemplative Life,' a critical edition by F. C. Conybeare; 'Summer Studies of Birds and Books,' by William Warde Fowler; 'Structure and Life of Birds,' by F. W. Headley; and the entire series of "English Men of Letters," to be reissued in thirteen monthly volumes, containing each three lives.

Allyn & Bacon, Boston, have in press a new Latin Grammar, by Prof. Charles E. Bennett of Cornell University.

'Prose Dictation Exercises from the English Classics,' by James H. Penniman, is to be issued by D. C. Heath & Co.

Hunt & Eaton have nearly ready 'The Literature of Theology,' by Bishop J. F. Hurst.

Fleming H. Revell Co. will publish next week 'Municipal Reform Movements,' by Wm. Howe Tolman, secretary of the City Vigilance League, New York.

As each successive volume reaches us of Mr. Larned's most painstaking compilation, 'History for Ready Reference and Topical Reading' (Springfield, Mass.: Nichols), we are increasingly impressed with a sense of its usefulness not only to journalists and the frequenters of public libraries, but also, on occasion, to more serious students. The fourth volume, for instance (Nicæa to Tunis), which has just appeared, calls for commendation for the original documents which it contains; under "Papacy," the Encyclical and Syllabus of 1864, the Constitution of 1870 promulgating the dogma of infallibility, and the Italian law of the papal guarantees; under "Scotland," the Covenant of 1638. The work is certainly a good piece of book-making, very systematically and thoroughly done. Still, readers must not take too literally the promise on the title-page of "a complete system of history" "from the *best* historians, biographers, and specialists," "representing the *better* and newer literature." A large part of the contents is, perhaps of necessity, taken from second-rate books, which have the merit, for the editor, of getting over the ground rapidly.

In John G. Alger's 'Glimpses of the French Revolution' (Dodd, Mead & Co.) there are many scraps of information about particular episodes of the Revolution, which may serve to correct earlier writers on certain points of detail and to furnish diverting anecdotes for moments of leisure. The most interesting pages are those which describe the fate of various Englishmen to whose part in the Revolution Mr. Alger has devoted a previous work. For the serious student the book can have merely the value which comes from its hints upon minor questions, since the writer's statements of the results of his special researches are not substantiated by either foot-notes or references. Moreover, it exhibits a strange carelessness here and there, especially in the use of names. For example, "Dannou" is printed for Daunou, "Dussieux" for Dusaulx, "Dutart" for Dutard; and, still worse, "Dumouriez" for Lafayette, "Constituent" for Legislative Assembly. Basire is spoken of as a member of the Committee of Public Safety, and perhaps Moïse Bayle also, unless Committee of Public Safety is printed where the author intended Committee of General Security, which in one place he calls Committee of General Safety.

Few books have as curious a history as the Memoirs of La Révellière-Lépeaux, the Girondin statesman and Director, which have just been published in Paris. His family, like those of other prominent Revolutionary leaders, do not seem to have looked back with satisfaction upon his part in the struggle. Indeed, it has been observed that the men of the second and third generations in these families have been more frequently found on the Right than on the Left of French legislative assemblies. But La Révellière-Lépeaux left strict orders that his Memoirs should be printed, and authorized his son only to revise their form if he believed this to be necessary. The son scrupulously obeyed the letter of the parental decree, even refusing to alter in any respect the manuscript, and then locked up the whole edition. In 1879 it was said to be in a cellar at Angers. The manuscript, however, had been used by Thiers about 1827, when he was writing upon

the Directory, and by Lamartine in his 'History of the Girondins.' As soon as it was printed a copy was, in accordance with French law, deposited at the National Library, which made the Memoirs accessible to other investigators. In 1879 Jean Destrem printed in the *Revue Historique* copious extracts, especially about the Directory, which is the chief subject of the Memoirs.

A new attempt to explain some of the curious objects sculptured on the Assyrian monuments has been made by Dr. E. Bonamia, and the results of his investigations appear in 'The Flora of the Assyrian Monuments and its Outcomes' (Westminster: A. Constable & Co.). He gives drawings from the ancient slabs, on which he finds representations of the date-tree, the vine, the pomegranate, the fig, the banana, the melon, the pine tree, the reed, the lily, some daisy-like plant, and the baobab. Some of these identifications are old. Layard figured pomegranates and reeds, and spoke unhesitatingly of dates, apples, and bunches of grapes. The cone like object so often seen in the hands of attendants is still a mystery. Layard wrote, of one such object, that he "would not hesitate to identify it with the pineapple unless there were every reason to believe that the Assyrians were unacquainted with that fruit. The leaves sprouting from the top proved that it was not the cone of a pine-tree or fir." The pineapple theory cannot stand, for the highest authority (De Candolle) has decided that the plant is American. Dr. Bonamia reviews several theories, and then advances his own, that the cones were cedar-cones used as sprinklers for holy water. The later chapters of the book contain, among other things, a very ingenious theory of the evolution of the fleur-de-lis of architecture and heraldry. The symbol is not the flower of an iris at all; it is a pair of horns tied to a date-tree to keep off evil spirits—"luck-horns" the writer calls them. He argues very fairly that the cross-band or ligature of the accepted emblem represents nothing in the iris-blossom, while it is easily explicable as the fillet by which the horns were attached to the tree.

Neither the "literature" nor the "art" of the fourth number of the *Yellow Book* shows much change from No. 3. Mr. Aubrey Beardsley's mannikins are even longer drawn out as to body and more ophidian as to head than usual, and Mr. Sickert and Mr. Steer are even uncommonly uninteresting. Unless Mr. George Moore really looks like Mr. Sickert's portrait of him, he should have good cause of libel. Perhaps it would be better for the reputation of the contributors with the world at large if they altogether left off doing portraits of each other.

Since Poor Richard, Americans cannot be said to have shown a genius for almanac-making; for novelties and successes in that line we must still look abroad. One of the latest candidates for favor is the *Almanach Hachette*, "petite encyclopédie populaire de la vie pratique," now in its second year. This is in its way a real addition to handy books of reference, whether one wishes the Republican Calendar brought down to date, or would recall the relative proportion of European armaments (here graphically shown also by figures of infantry and cavalry drawn to scale according to the ratios of the respective nations), the words and music of the Delphian Hymn to Apollo, Guénon's mode of choosing a cow by the escutcheon, French systems of stenography, etc., etc. A section exhibiting railroad routes and fares from Paris to the neighboring large cities is but one of many which make this almanac recommendable to every tourist in France. The telephone system is mapped, and of maps, plans, and illustrations there are more than we can enumerate. Portraits of the distinguished dead and of living monarchs and other rulers are further portions of the feast for 1895. The typography is clear and handsome. Those who complain of the fine letter pay the *Almanach* a compliment, says the editor; they would fain make of it a reading-book! The edition we have been describing is the smaller of two.

We are tardy in recording the birth of a new supernaturalist monthly — the *Metaphysical Magazine*, "devoted to Occult, Philosophic, and Scientific Research," issued by the Metaphysical Publishing Company, No. 503 Fifth Avenue, New York. In the first article in the January number, Dr. Elliott Coues propounds, to account for the movements without human contact of his own sitting-room table, and other similar phenomena, "a telekinetic theory of levitation," as he calls it. This "theory" simply asserts that there is a force of levitation or repulsion between bodies, which is the converse of the force of gravitation or attraction, but which, unlike the latter, requires for its conveyance some "imponderable medium connected with mental activities." The other articles in the number are of the optimistic, pantheistic type; those by Dr. A. Wilder defending reincarnation, by W. J. Colville on "Mental Healing," by Mrs. A. M. Diaz on "Teaching Religion to Children," and by Mrs. Le Plongeon on "Occultism among the Mayas," being the most noteworthy. On the whole, one notes with pleasure the way in which what one may call extra-academic philosophy and extra-ecclesiastic religion gradually put on less and less eccentric forms. This magazine promises to be a great improvement in this way on its predecessors.

Mr. William S. Baker returns to his useful diary of Washington's movements in the January number of the *Pennsylvania Magazine of History and Biography*. He now follows the General and President day by day after the Revolution to the close of his life. This tracing, coupled with Mr. Baker's 'Itinerary' for the Revolution, will constitute a great service to history worthily rendered. A fine photogravure after Stuart's head of Washington in the Boston Museum of Fine Arts is a frontispiece to this number of the magazine.

A Virginia witch turns up in the January issue of the *William and Mary College Quarterly*. Mr. Edward R. James prints the documents leading up to and in connection with the "Suite for Suspition of witchcraft brought by Luke Hill ag^{t} Grace Sherwood." This widow of James Sherwood had already brought action against "Hill & Uxor" for assault by Mrs. Hill. She was now ordered "to be Searched according to y^{e} compl^{t} by a Jury of women to decide y^{e} s^{d} Differr"—that is, for witch-marks—and the jury reported that they had "found Two things like titts wth Severall other Spotts." But just here the tale breaks off, to be continued.

M. Charles Barneaud begins, in the *Revue Internationale de l'Enseignement* for January 15 (Paris: Armand Colin & Cie.), a long article on "Jefferson and Education in Virginia," in the course of which he affirms that, as he writes, "there is no *haut enseignement* in the country of Jefferson and Washington [he means the United States, not Virginia]. . . . There is nothing that even approaches the conception of our Collège de France." M. Barneaud has, of course, availed himself of Dr. Herbert B. Adams's brochure on 'Thomas Jefferson and the University of Virginia,' in the United States Bureau of Education's series of "Contributions to American Educational History." We have, by the way, to record several additions to this series, relating the history of education in Rhode Island (by Wm. Howe Tolman), Connecticut (by Bernard C. Steiner), Delaware (by Lyman P. Powell), Tennessee (by Lucius Salisbury Merriam), and Iowa (by Prof. Leonard F. Parker). They are all more or less provided with illustrations, chiefly views; and in the Iowa monograph is given a facsimile of President Grant's address at Des Moines in 1875, from which it appears that his views on State-popular education were completely perverted in the newspaper reports of the day.

The editors of the *Zeitschrift für die gesamte Strafrechtswissenschaft*, in furtherance of the efforts made by that periodical to promote uniformity in criminal legislation, are publishing a "Sammlung Ausserdeutscher Strafgesetzbücher in Deutscher Uebersetzung," intended to supply low-priced text translations of the criminal laws of the world. The last number issued contains the penal code of Mexico: 'Das Mexikanische Strafgesetzbuch vom 7. Dezember, 1871' (Berlin: J. Guttentag, 1894). The anonymous translation is from the hand of Mr. Ernest Eisenmann, a German lawyer living in Paris, whose practical knowledge of Mexican jurisprudence one could wish had been drawn upon for annotations. The previous seven numbers of this useful series have brought to the aid of German students the penal codes of Holland, Italy, and Finland; the laws of Denmark, and of Sweden governing military punishments; the Norwegian legislation concerning jury trials, and the chapter of the laws of New York for 1881 relating to crimes.

The *Monthly Weather Review* for October last, just issued, contains a unique record of a tornado that passed over an observer's station in Little Rock, Ark., at 8:28 P. M. October 2, 1894. It cut off the upper story of an adjacent building and threw it on the observer's office, but fortunately the self-recording barometer was not injured, and its tracing shows a sudden fall and rise of pressure amounting to 0 38 inch at the time of the tornado's passage. No such record as this has ever before been made. As the tornado went on to the northeast, it passed over the city gas-works, and at once all the gas-lights in the city went out. Prof. Abbe, editor of the *Review*, points out that the record of rapid fall and rise of pressure on the barograph may be due to the action of a strong wind on the building, first somewhat exhausting the air by suction through the chimney, and then raising the pressure by bursting in the windows; if so, the record might not indicate the low pressure believed to exist in the centre of the tornado-whirl.

Prof. G. Hellmann of Berlin has undertaken, with the aid of the German Meteorological Society, to reprint, sometimes in facsimile, a number of old and rare meteorological works of special interest (Berlin: Asher & Co.). The numbers already issued are Reynman's 'Wetterbuechlein,' printed originally in 1510; Pascal's 'Récit de la grande expérience de l'équilibre des liqueurs,' 1648; Howard's 'On the Modifications of Clouds,' 1803. Each number is accompanied by an introduction by Hellmann. These curious reprints may be obtained at publisher's prices in this country from A. Lawrence Rotch, Blue Hill Observatory, Readville, Mass.

Prof. E. Reyer of Vienna has for several years been conducting a series of geological experiments, illustrating fractures, folds, erup-

tions, and so on, and some accounts of his results have been published. He now issues an explanation of his methods and apparatus, which must prove of much service to college teachers in geology and physical geography. He describes his experiments as inexpensive and simple. His essay is entitled 'Geologische und Geographische Experimente' (Leipzig: Engelmann).

The Icelandic geologist Th. Thorodssen, who was created an honorary doctor of philosophy last summer by the University of Copenhagen, has concluded his investigations of Iceland for this year. These studies, which were begun in 1880, will be completed in three years, when for the first time full and exact data concerning the geology of Iceland will be accessible. The results already obtained serve to correct many false impressions and to present facts hitherto undreamed of. The principal subject of inquiry was the Vatnajökul, the largest field of ice in Europe, which has now been investigated in all its parts. The territory adjoining the eastern corner of Vatnajökul, which has hitherto been practically unexplored. was found to contain a number of lakes, and several other changes on the map will have to be made. On the east coast forty-six new deposits of liparites and granophyres were discovered, and near Lón a previously unknown mass of gabbro of considerable extent. Dr. Thorodssen's investigations are confined to the summer months, partly on account of his engagement during the rest of the year as teacher at the Latin school in Reykjavik, partly by reason of climatic conditions.

Sun and Shade for January (N. Y. Photogravure Co.) is noticeable for the beginning of specimens of the company's chrome gelatine process. The number is given up to reproductions of Dutch paintings, and the first (a Holy Family by Van der Weyden) is in color.

Not altogether unknown to the public, yet not certainly procurable, have been photographic copies of a very remarkable daguerreotype of Daniel Webster, which, following the mode of designation of works by the old masters, we should denominate "Webster with the stove-pipe hat," though the high stock and the blue coat and brass buttons are also a part of the costume. The eyes are the great feature, and the weight of the whole face is eminently Websterian. The original is now owned by Mr. F. De B. Richards, also the possessor of an equally characteristic daguerreotype of Clay, whose oratorical mouth is more the man than the eyes. Mr. Richards has permitted Mr. F. Gutekunst, Philadelphia, to make enlarged phototypes of both in permanent ink, and they take rank among the most desirable nature-likenesses of these eminent men.

—President Eliot's annual report opens with those Harvard obituaries which are models of pithy and apt characterization. His anticipatory obituary of football we have already cited; but both his moral and his physical objections would be much mitigated if the game were confined to Harvard men on their own grounds. Cheating and slugging and intentional disabling would disappear like magic. But we have yet to enlist President Eliot's support of the abolition of intercollegiate athletic contests —the true seat of the evils. Dean Briggs, by the way, reports that "last year the monstrous methods of training and coaching for football rendered the low academic records of our football-players less blameworthy than pitiable." Is there, or is there not, a relation between overblown athletics and the fact that gifts and bequests to Harvard are in disregard of the crying need of the library for a brand-new commodious building? Matters have now reached such a pass that President Eliot can only bespeak a general contribution on the part of the alumni. This is surely a paradoxical situation. Perhaps a more taking opening for princely endowment is in the direction of new affiliated colleges for men, united to the university by the same tie which now binds Radcliffe College. President Eliot is prepared to welcome such foundations, and apparently he is of one mind with Prof. Peirce in regard to the happy strengthening of the Graduate School by the admission of Radcliffe College graduates to it on the same footing as men, even to a (logical) claim on the special degree of Ph.D. He looks hopefully on the diminishing ratio of College to University students, as surrounding the former with "a large body of mature and earnest students who have a serious purpose in view," and whose influence will tend to eliminate from the College "inconsistent survivals," "trivialities and crudities," such as hazing, pure and simple or in that disguised form called society initiation (*alias* "running") which, Dean Briggs tells us, makes it "often almost impossible for a newly elected member" to study while it is going on, so protracted is it, and in such "selfish disregard of the novice's welfare."

—When, some two years ago, the first volume of Mr. Russell M. Garnier's 'History of the English Landed Interest' (London: Sonnenschein; New York: Macmillan) was noticed in these columns, it was necessary to point out the incompetence of the author for the task he had undertaken. Some of his readers expected that when he came down to more recent centuries, his practical experience as a land agent would make itself apparent, and would cast into the background his defects as a scholar. These hopes have hardly been realized by the second volume, devoted to the "Modern Period," which has since appeared. Scattered here and there, indeed, there are passages where we hear the voice of the man of agricultural affairs, accustomed to look at the rural situation from the landlord's point of view, but with a kindly tolerance for the rest of mankind. Moreover, Mr. Russell has turned over a great deal of the agricultural literature of the last three centuries, and he renders a useful account of several little-known pamphlets—although we are surprised to see how small a space he gives to William Marshall, the indefatigable critic of Arthur Young. But when, seduced by the interest of passages here and there, we set about reading a chapter right through, we soon become too much annoyed with the author's desultoriness and inconclusiveness to give him credit even for his industry. Those who know a good deal about the subject already will be able to pick out some excellent bits, but it would be folly to turn to a book like this rather than to the treatises we already possess from Caird, Léonce de Lavergne, and Prothero.

—In 1887 a work appeared from the pen of the Rev. H. W. Clarke entitled, 'The History of Tithes from Abraham to Queen Victoria.' This was rewritten, and was published as a new work in 1891, under the title 'A History of Tithes,' of which a second edition or reprint has recently appeared (London: Sonnenschein; New York: Scribners). The book states clearly most of the disputed questions in connection with the history of tithes, and is a good repertory of the views of leading writers on the whole subject, from Selden to Lord Selborne. Our author's tone is very categorical and polemical, and he pretends to considerable originality; but, with all his ostentatious parade of learning, he leans less frequently upon the original sources than upon Selden, Kemble, Stubbs, and other modern authorities. He cites Ingulph without any intimation that the latter's chronicle is a worthless fabrication. He defines folcland as the national property, or the property of the community, ignoring Vinogradoff's recent demonstration that folcland is simply family land, held by folk-right, or what most writers call ethel. He frequently speaks of Charlemagne's kingdom of "France." The proof-reading of the book and the arrangement of material leave much to be desired. There are some surprisingly abrupt transitions to new subjects; for example, in chapter ix. the author suddenly branches off into a general account of the monks, without showing the connection of this topic with what precedes or follows it. His computation of the population of England at various periods before 1066, in the same chapter, is equally perplexing. Most of his general conclusions are, however, correct, and he exhibits much industry in the collection of facts; hence, with all its defects, the book will be found useful.

—We have a new and elaborate study of the vexed question of the Cabot landfall, in 'The Voyages of the Cabots,' by Dr. Dawson, the Queen's printer of Ottawa, a brochure reprinted from the current Transactions of the Royal Society of Canada. Off the headland known as Cape Breton is a small and barren island called Scatari. This, in Dr. Dawson's opinion, is the island of St. John which John Cabot found contiguous to his landfall, and the neighboring headland is the "prima tierra vista." It has been generally held by those who accept the evidence of the Cabot mappemonde that Cape North, at the extreme upper end of Cape Breton, was the landfall, because the legend above quoted seemed to be attached in the map to that particular point; and this with such scholars has made Prince Edward Island the St. John of Cabot. Dr. Dawson's view is that the legend refers to the island of Cape Breton and not to any particular headland of it, and that the southeastern cape and Scatari Island best answer the description. Cape Breton, in his judgment, would be the natural landfall of a vessel which had cleared Cape Race, and which steered westward by compass, in ignorance of the magnetic variation then existing. He contends, further, that the existing cartography of the region previous to Champlain made no account of Prince Edward Island, but did represent Cabot's St. John as lying seaward and not in the gulf. Dr. Dawson examines a large number of maps to prove this, beginning with La Cosa. He regrets not having seen the Santa Cruz map of 1542 preserved at Stockholm. He would have found that also to make a part of the evidence as he arranges it. He seems not to consider that Scatari Island is of insignificant size, compared with the prominent character which this seaward island assumes in the early maps. It is constant in position no otherwise than in being always towards the open sea.

—The Chino-Japanese war has been the fertile cause of a new bloom in the periodical literature of Japan. The semi-monthly mail brings us a bundle of brilliantly covered and illustrated magazines, handy manuals of history, and gayly colored and white-and-black broadside pictures of men, scenery, architecture,

and events in Korea and China. Besides several periodicals especially devoted to the war, there has appeared in Tokyo a magazine as large and handsome as either the *Century* or *Harper's*, though the illustrations come out of the acid bath instead of from the block of the wood-engraver. The *Sun*, of which Vol. I., No. 1, is before us, is a monthly review of politics, economics, science, literature, and art, of 200 pages, of which twelve are in English. In the list of its contributors shine stars of first magnitude in the world of Japanese letters. Its divisions are biography and history, geology, politics, law, literature, fiction, fine arts, economics, miscellaneous, etc. Among the contributions are three on "The Influence of the War" upon education, upon science, and upon literature. Another competent writer treats of the advantages and disadvantages of Chinese Ideographs Another discusses future policy toward China. Out of the sixteen signed articles by men who occupy the first grades of ability in their specialties, the most remarkable piece is that by Prof. Kumé, who recently incurred the displeasure of the Government by the application of the higher criticism to the Japanese sacred documents. He writes of "a great revolution in the world of letters," and it is hard to say which should be most admired, his logic, rhetoric, almost entirely new method of using the Japanese language, or his argument.

—Briefly stated, the latter is as follows: China was once to the world of Eastern Asia what Rome was to the Western World. Now that this great world has, in the eyes of the Japanese, fallen, even Japanese boys despise China, and the doctrines of Confucius are contemned and rejected by all. Yet at such a time as this there is great danger of going too far in such contempt, for, as Prof. Kumé argues, the truth is not destroyed when the country in which it grew is ruined. Christianity survived the fall of Jerusalem; Buddhism lived when the followers of Gautama were driven from India; Rome, though dead, persists in European jurisprudence and civilization. What lingering respect for China the Japanese had has been destroyed by recent military prowess. Hence the Japanese people are now apt to think that they are pure, humane, and fully civilized, as China never was; but this idea is pure conceit and must be purged out. One has only to compare Old Japan with New Japan to see that in reality Japanese power is a borrowed one, and that "we beat China because we adopted Western civilization." China, on the contrary, refused to improve or reform; the Chinese had no division of labor in intellectual matters, they mixed things prehistoric and fossilized in hopeless confusion with things modern, and they kept in the old ruts, making political procedure also to depend on privilege and bribery rather than on justice and right for all. On the contrary, the Japanese intelligently borrowed and applied Western forces and methods. What is necessary now is that Japanese educated men should study the secrets of the real difference between the modern Chinese and Japanese, and the cause of success, in order to learn wisdom and permanently profit by it, rather than to fill themselves with conceit by thoughtless boasting. The article is profoundly philosophical and thoroughly appreciative of the real facts, and is a hopeful sign that Japan will be wise in the use of her present power. The general tone and outlook of the article show that, by entering upon this war, Japan has irrevocably committed herself to progress.

—The medical faculty of the University of Paris opened its doors to women in 1868, but at first only a very few availed themselves of the privileges thus offered. In 1878 the number in attendance was 32; during the next ten years (1878–'88) it increased to 114, and is at present 183, of whom the great majority (167) are Russians. The remainder are Poles, Rumanians, Servians, Greeks, and Scotch, and only one German, who also bears a Scotch name—Gertrude Gordon—and to whom we are indebted for our information. Many of them, chiefly Russians, have been through the gymnasium; others have acquired a more or less thorough knowledge of literature, history, the natural sciences, and philology in such secondary schools as were accessible to them. As foreigners they must all be examined in Latin and Greek before admission, and be able to translate passages from the easier classical writers, Cæsar and Xenophon, at sight, and to analyze them grammatically. The courses of study are pursued conjointly with the young men, and this association, so far from producing a demoralizing effect, tends to elevate and refine both sexes. Miss Gordon declares that during an experience of three years in the clinique, the auditory, and the dissecting-room she has never observed that the presence of young ladies occasioned the slightest improper word or act on the part of their male colleagues. Most of the women who practise medicine in Paris are married. "Model wives and happy mothers, they nevertheless find time to devote to their profession." The professors and directors of the hospitals praise the conscientiousness and diligence of the women, and acknowledge them to be, both in general intelligence and in special knowledge, fully equal to the men. The latter also admit the truth of this statement, and assert that they ought to be even superior in these respects, since they are not compelled to waste their time in cafés and cabarets. It is still difficult for some of the older members of the faculty to reconcile themselves to the new state of things; and on one occasion, during an examination for a degree, the late Prof. Charcot exclaimed: "Mademoiselle, you are young and beautiful. Why did you not prefer to marry?" The candidate blushed, but declined to answer the question as irrelevant.

THIERS REDIVIVUS.—II.

History of the Consulate and the Empire of France under Napoleon. By L. A. Thiers. 12 vols. London: Chatto & Windus; Philadelphia: J. B. Lippincott Co. 1894.

History of the French Revolution. By L. A. Thiers. 5 vols. London: Richard Bentley & Son; Philadelphia: J. B. Lippincott Co. 1894.

THIERS the historian of the Revolution stood in the way of Thiers the historian of the Consulate and the Empire. In a speech delivered at Mâcon, Lamartine called the latter period "the counter-revolution of Glory." To champion at the same time the Revolution and the counter-revolution, without laying one's self open to the charge of inconsistency, is, however, somewhat difficult. "I am conscious of loving liberty and the glory of France as much as I did before." With this sentence Thiers bridged over the chasm between his two works. He had not himself, in fact, renounced his allegiance to the principles and ideas of the Revolution, nor did he want the people to do so. Very far from it. Still, the 'History of the Consulate and the Empire' was conceived as a political manifesto, which, while not intended to supplant that of his previous work, should be coupled with it. The ideas of the Revolution and the revolutionary policy of the heir of the Revolution were to be linked together, not to say joined in indissoluble wedlock. As "minister of the 1st of March" (1840), Thiers had put his shoulder with a will to the wheels of the chariot of "glory," which, with the exception of the little airing of Angoulême's easy victory over the Spanish Revolution, the campaigns in Algeria, and the battle of Navarino, had been allowed to rust. He had succeeded in getting up such an excitement that for a moment Europe was believed to be on the eve of a great war. Happily, Louis Philippe preferred safety to uncertain glory. The minister whose hobby it was to make Paris the strongest fortress in the realm, and whose night's rest was disturbed by dreams of the "natural" boundaries of France, had to go. Then it was that he set to instilling into the minds of the people as historian what he had preached as minister from the tribune of the Legislative Chamber. His success was great—much greater than he desired, as the future was to prove. His fellow-bourgeois had fought shy of engaging in military ventures, principally because these were too apt to affect their tills injuriously. But what harm could there be in reading of the wondrous deeds of the past? They had all been a reality so short a time ago that tens of thousands were still alive who had lived through all of them. To read of them involved no risk, and yet was eminently gratifying to the national egotism; for had it not the right to assume that the nation needed but the will to have a part at least of the miracles wrought by the fathers repeated by the sons? Well, every café in France could furnish every day in the year an object-lesson proving this reasoning to be dangerously fallacious. The habitual sipping of absinthe is not harmless, though one addicted to it will seldom, if ever, exhibit the grosser symptoms of intoxication. Physicians have declared that the alcoholism it is capable of producing is of a most malignant type, as being especially hard to cure. The 'History of the Consulate and the Empire' was a systematic effort to work the nation, in a similar manner, into a similar kind of moral alcoholism.

Still, if a poisonous drug, it contained also its own antidote—provided full credence can be given to Thiers as a witness testifying in his own behalf. We are assured in the preface mentioned in the first article, that he is animated by an irrepressible passion for uncompromising truth. Time is no object with him; no pains or trouble does he shun to get at the truth; he experiences "a kind of shame at the mere idea of stating an inaccurate fact." Fortunately, he never has occasion to blush for shame, for he has "seized and reproduced that absolute truth of facts themselves" revealed by authentic sources. If so, his philosophizing about the facts, however deceptive and insidious, could do no serious harm. But there is more than one way of being untruthful. A hundred ways are open to the historian to falsify the truth without uttering a single lie, and with some of these Thiers was very familiar—for instance, that of simply leaving untold what did not suit his purposes. If that could not be done because the facts were too notorious, there was the other way of disposing of them in as few and indifferent words as possible, while to whatever suited his purposes any amount of space was devoted, and the art of the fascinating writer exercised with the utmost care. The description of ceremonies fills

pages, but we are not told *how* Bonaparte became president of the Italian republic; Toussaint's terrible end in the Fort of Joux is passed over in silence, after the villanous treachery which led to his capture has been declared necessary dissimulation; and seven lines (iv, 205) suffice for the atrocious and absolutely purposeless murder of Palm. To guard still more against "this deplorable act" impressing itself upon the reader's mind, even the name of the unfortunate man is withheld from him. Two of the seven lines are, however, occupied in pretending that it was merely the application of "the severity of the military laws"—an assertion as unwarranted by the facts as if applied to the execution of the Duc d'Enghien.

As truth can be concealed by silence and a wrong perspective, so can it be falsified by the color of the light in which the facts are made to appear. By the master-stroke of substituting Providence for the fatality which had stood him in such good stead in the History of the Revolution, Thiers cleared the field of all obstacles in this respect. Bonaparte once set up as the man of Providence (i., 32), the author is at liberty to turn all contention against him into a conflict with Providence, and on the strength of that to quash every indictment that must be quashed if his general thesis is to stand. So far as the earlier years of Bonaparte's power are concerned, to arraign him smacks, indeed, of sacrilege. Only "some detractors have taken the liberty of saying" that "ambition" was his sole motive in "reëstablishing, on its ancient basis, the Catholic religion." We are asked to believe that the man who, in his earlier encounters with Rome, had called the cardinals "drivelling babblers," on the Nile tried to palm himself off as a good Mussulman, and in the Alps ordered a purposeless skirmish because his mistress wished to see some fighting, was now prompted by the desire "of supplying the moral want of souls." "Doubtless," remarks Thiers, "Napoleon is to be excused if he foresaw that an augmentation of power would reward the accomplishment of this good work" (ii., 121, 122). Yet he reports the First Consul as declaring:

> "Yes, doubtless, a Pope I must have. . . . With the French armies and some deference I shall always be sufficiently his master. When I shall raise up the altars again, when I shall protect the priests, when I shall feed them and treat them as ministers of religion deserve to be treated in every country, he will do what I shall ask of him, through the interest which he will have in the general tranquillity."

Besides, we have the direct testimony of Thiers to the fact that, when Napoleon was just beginning to make himself the man of Providence, he was open to other motives than that of "doing good in all things." "When in 1796 he went into Italy," we are told, "finding it in his interest (!), he protected the priests" (xii., 392).

In other particulars, Thiers's passion for "the absolute truth of facts" cannot stand examination. Every-day morality is wont to distinguish between fibs and lies. Our historian never stoops to lie, but he is far from being above fibs. His military figures abound with inaccuracies, which invariably redound to the glory of the French and their great captain. His later volumes are much less objectionable on this score. In them he speaks quite freely of the "exaggerations" of the bulletins; and in other and more important respects they compare very favorably with the earlier ones. He is still not, as he claims to be, strictly just to the adversaries of France, but he is markedly juster towards them than most of his French predecessors had been; his truthfulness has so much improved as to excite astonishment. Part of the self-contradictions with which the work is replete are due to this, and therefore reflect honor upon the writer. For instance, he first assures us that there was no "perfidy" on the part of France in the events at Bayonne and what led up to them, but that it was all the outcome of a concatenation of regrettable circumstances. When he afterwards comes to tell the story, however, he bluntly accuses Napoleon of "cynicism of ambition and lust of power"; nay, he charges the French policy with having been guilty of "fourberies." His doing so deserved all the more praise because he was the first to lay bare, by irrefutable documentary evidence, the whole atrocious plot in all its revolting details. The earlier volumes did comparatively little to enrich, deepen, and correct our historical knowledge; the later ones, however, really rank among the great historical works. They teem with new and valuable information derived principally from the correspondence of Napoleon, to which Thiers was the first to gain unrestricted access. This correspondence, and all the other sources which he was the first to utilize, have now been for many years common property, for which reason there was no call for the republication of the 'History of the Consulate and the Empire,' though in its time it was a long stride forward. Like the History of the Revolution, it is now out of date, and in many respects it was out of date even at the time it was published. If Thiers had been as truthful as an angel, he could not have got at the "absolute truth of facts" available in his day, simply because he attempted to extract it from French sources alone.* Not only where a rigorous cross-examination is required to elicit the truth, but also where merely the situation in the opposite camp must be known to gain a correct view of the field, Thiers often signally fails to portray correctly, because he lacks the necessary knowledge. Occasionally he betrays such gross ignorance that one can hardly trust one's eyes. Thus he names in the same breath Stein and Kotzebue as patriotic leaders (viii., 322), and (in this sentence) beside the great baron only the contemptible shallow writer of comedies.

The most remarkable thing in the growth of the historian Thiers is that it is, in the main, not gradual but sudden. He continues to grow after his frame of mind has undergone a change, but this change is abrupt. It is announced to the reader on the third page of the fifth volume in these words: "My reason, tempered by time, enlightened by experience, is well aware of all the dangers concealed beneath this immeasurable greatness" (July, 1807). The explanation of this is, that between this volume and the preceding one lay the Revolution of 1848 and part of what it was leading up to. The historian is getting purified by the hard lesson taught to the politician. The seed he more than any one else has sown broadcast by the creation and propagation of the Napoleonic legend, has sprung up only too luxuriously, and is fast ripening into a bitter crop. A new revolution, in which he has no part or parcel, has swept over the country. It has come without him; for him there has been no place in it; it has rushed over him; and its outcome—? Another Napoleon is making himself its heir, but that renders it all the bitterer for him, who had contributed perhaps more than any other man towards putting the crown on the head of Louis Philippe. For Napoleon Bonaparte had, in fact, never been his real idol; what he had indeed worshipped was the aggressive, conquering genius, the "glory" of France, whose incarnation Napoleon Bonaparte had happened to be. Was there any reason to expect that his nephew would become its second incarnation? Thiers had got more than he had bargained for, and that had a powerfully sobering effect upon him. But the intoxication was inborn, and therefore neither this nor anything else could effect a real cure.

"Let me be allowed a moment of enthusiasm for so many wonders, which did not last, but which might have lasted, and to relate them with an entire forgetfulness of the calamities which followed." That is the keynote to the later volumes. The political creed of one who, after nearly half a century, had still an irrepressible craving for enthusiasm in fixing his gaze on the summer of 1807, rested upon a slender and brittle moral foundation. That Napoleon's deeds were damnable, and that he was prompted to them by damnable motives, is not what constitutes in the eyes of Thiers primarily and principally the guilt of Napoleon: his real crime consists in overacting his part of the man of Providence so as to render impossible the perpetuation of what, in the opinion of Thiers, could have been consolidated and perpetuated. In other words, the true arraignment is not his ruthlessness, but that he allowed his ruthlessness to betray him into such blunders that France lost what might have been permanently secured to her of the spoils. His Napoleonic enthusiasm is now greatly tempered, but this inconsolable regret that the man of Providence took more than could be kept, and thereby precipitated the loss of everything, breaks forth again and again with undiminished force up to the last page. Therefore up to the last page we look in vain for *that* truthfulness which, at least with the historian of such times, can be found only where moral conceptions and convictions are not vitiated. Thiers relegates these to the second place. With him they are, and remain to the end, pages made to carry in due humility the train of the royal robe of Queen Glory. Only "the slanderers of his glory and of ours," "foreigners," or "parties associated with foreigners," raised hue and cry about Napoleon's spoliations and extortions and the use he made of the money for the benefit of his lieutenants. "These treasures were not taken from the people, but from emperors, kings, princes, convents, leagued against France ever since 1792." In spite of the sobering and purifying influences of the February Revolution, it costs Thiers nothing to pen these audacious sophisms (v., 79), and in the last pages of the last volume (xii., 393) he who has had the correspondence of Napoleon, with all its brazen avowals, before his eyes, still has the hardihood to write that the general, in his first campaign, laid "a discreet, just, and economical hand on the riches of Italy." Nor is he more thoroughly cured of his infatuation in regard to the grievances of French liberty against Napoleon. To hear him ask in the second volume (182)—speaking of the end of 1801—"Who would believe that, notwithstanding so much good, either already done or on the point of being done, an opposition, and a warm one too, could be raised?" cannot surprise us. Having noticed with satisfaction the new spirit which has gained a lodgment in his mind after the downfall of the July monarchy, we note, however, with dismay and some astonishment that he speaks in the fifth volume (86) of the nation's "having

*For the later volumes he did consult, or had others consult for him, part of the more important foreign publications.

on a day of fatigue relinquished to him [Napoleon] the trouble of willing, ordering, thinking for all," in a way strongly calculated to suggest the inference that he rather glories in it. But our astonishment vanishes long before we are through with the work. At the end of the last volume (xii., 394) we read that "the friends of liberty" unjustly "blame Napoleon for not having" given "a political constitution to the country," for, France not knowing her own mind as to what kind of government she wanted, he "could not be the legislator of France in a political sense."

Though sobered down and purified, yet only probe his mind and his heart deep enough and you will find that he is after all still the original Thiers, who in all sincerity professed to be a friend of liberty, but who prized above everything "glory"—glory, whether it was moral or immoral, whether it was a curse or a blessing to the world, whether it wrought the happiness or the ruin of his own country. Is that too harsh a judgment? The closing sentences of the preface, written on the 10th of October, 1855, read thus:

"I am convinced that in these later volumes will be recognized an historian who is an ardent admirer of the great Napoleon, the most ardent friend to France, who, while deploring that this remarkable man was so unfettered in action, even to his own destruction, is immensely grateful to him that he left us, in leaving us glory, that seed of heroes, that precious seed, which has sprung forth again in our land and given to us the conquerors of Sebastopol. Yes, even without him, our soldiers, his pupils, have been as great, as victorious, as they were of yore under him! May they ever be so, and may our armies, whatever be the government directing them, be ever triumphant! The best compensation for being of no account in one's country is to see that country taking the place in the world to which it is entitled."

What a terrible awakening, fifteen years later, from the delusion that from the seeds sown by the kind of glory he was "immensely grateful" for, a different crop would spring from that reaped by France in 1813 and 1815. Speaking of the summer of 1802, he writes (ii., 373):

"Nothing could be more judicious, more admirable, than the views of the First Consul at this happy epoch of his life. . . . While purposing to ally himself with Prussia, the First Consul concluded, with rare sagacity, that he ought not to make her so strong as to crush Austria, for then she would become, in her turn, the dangerous power, instead of being the useful ally, . . . that, to sacrifice at once to Prussia all the petty hereditary, ecclesiastical, republican States would be favoring the realization of that German unity more dangerous to the equilibrium of Europe, if it were ever accomplished, than the power of Austria had ever been."

Did Napoleon III. not act in 1870 upon this advice of the historian of Napoleon I.? All that Thiers had a right to reproach him with on this head was that he had not acted upon it sooner. Though Thiers, in 1870, opposed the war, because he justly doubted if France was at the time in a condition to wage it successfully, it was he upon whom a fearful share of the responsibility for it rested. And he was the last man who had a right to contest Germany's right to impose the cession of Alsace and Lorraine upon vanquished France. "Prussia and Austria had dragged Germany into an unjust war against the French Revolution, and they had been vanquished. France, by the right of victory, an incontestable right when the victorious power has been provoked, had conquered the left bank of the Rhine" (ii., 372). The man who went with Jules Favre to Versailles to treat with Bismarck, had penned these lines, and at the time they were published there was not a single Frenchman to protest against the doctrine laid down in them. Is there to-day a Frenchman bold enough to deny that in 1871 there would not have been a single Frenchman to protest against it if Bismarck had had to go to Thiers and Jules Favre to sue for peace?

MISS EDGEWORTH'S LETTERS.

The Life and Letters of Maria Edgeworth. Edited by Augustus J. C. Hare. Two volumes. Boston: Houghton, Mifflin & Co. 1895.

THOSE who are well read in the literary biography of the century will find but little that is new or strange in these two beautiful volumes, for the reason that a large collection of Miss Edgeworth's letters was privately printed, soon after her death, by her third stepmother and devoted friend. Long since, everything most significant in that collection found its way into this or that Life of Miss Edgeworth or some piece of contemporary biography. Mr. Hare's work has been one of selection mainly. His own contribution is a thread so slight that sometimes he seems to have forgotten his promise to give us the connection of events. There are many places where we crave additional information. A notable example is that of Miss Edgeworth's immediate guess that Scott was the author of 'Waverley': *Aut Scotus, aut Diabolus.* She writes a letter of elaborate criticism and commendation "To the author of 'Waverley.'" Every reader would like to know if it elicited any response. There is none given in Scott's letters of the time, but from Lockhart's 'Life of Scott' we learn that James Ballantyne answered the letter. No other letter received by Miss Edgeworth was such a feather in her cap, and Lockhart's Life is not so universally read and remembered that Mr. Hare should have disdained to mention it. "Positively this *is* equal to Miss Edgeworth" was, writes Ballantyne of Scott, the praise that gratified him most.

Mr. Hare's selection might have been much more exclusive without injury to the impression that he wished to make. Half as many details of domestic life and ordinary social intercourse would have given us a sufficiently clear idea of Miss Edgeworth's practical activities and the goodness of her heart. The lack of headaches and dyspepsia and other ailments is in happy contrast with some other biographies of distinguished persons. There is as little emphasis on others' illness as on her own. Given a predilection for pathology, it is terrible to think what an inundation of it we should have had, for her father was a much married man and had twenty-one children by his four wives. All these had their sisters and their cousins and their aunts, with such ills as the natural flesh is heir to, and a faithful catalogue of these would have been a burden greater than we could bear.

Mr. Edgeworth's marrying habit is notorious, but some few particulars may not be amiss. His first marriage was at Gretna Green, when he was an Oxford student, aged nineteen. Maria was the second child of this marriage, which proved unhappy. Heping to do better, immediately after the death of his first wife he married Honora Sneyd, who had rejected both Major André and Thomas Day, the author of 'Sandford and Merton,' a book suggested by Edgeworth. Miss Sneyd was one of the Lichfield set which numbered Dr. Erasmus Darwin and Anna Seward, "the Swan of Lichfield," among its celebrities. Mr. Edgeworth's unhappiness at home with his first wife "exposed him to the danger of being too happy elsewhere," and he applied the wisdom of those who fight and run away to those who love. He fled to France, and was shortly rewarded for his prudence by the death of his wife and the willingness of Miss Sneyd to be her successor. The happiness of this marriage instigated a third as immediately as the unhappiness of the first had instigated a second. It was with a sister of Honora Sneyd, in accordance with her advice—with the sister he cared for least; but this marriage proved extremely happy, and a fourth, equally precipitate, the happiest of all. So many marriages meant, as time went on, a household strangely mixed but singularly harmonious. Her father spurred Maria's intellectual activity, and had a hand in all her earlier works, aggravating, no doubt, the directness of their moral purpose. An upright man, he sought out many inventions of which the household conveniences bore ample evidence. Sometimes his guests were troubled by his patent locks, fearing they might lock themselves in and be forgotten—an event not unlikely in a family which sometimes numbered a full score and had as many guests. Cæsar's simultaneous dictation to several amanuenses was nothing to Miss Edgworth's writing her stories in the general sitting-room. She gauged the interest of her stories by their effect upon her younger brothers and sisters.

The narrowness of her range in fiction does not prepare us for the extent of her travels on the Continent and the breadth of her culture, which did not, however, extend to classical studies; for these her father's drastic theories of education had no place. We are assured that she was no politician, but seem to have here more a reflection of her biographer's sense of propriety than of her own. Certainly her allusions to political matters are frequent, and marked by an intelligence that we do not often find surpassed by the women of our own time. And it is a noticeable fact that 'The Absentee,' which Macaulay admired so much and compared at one point to the 'Odyssey,' was a document central to the misery of Irish politics and industry for many centuries. These volumes, in their least salient aspects, contain many things that will serve the historian of manners and opinions hereafter. The letters reflect, while at the same time they criticise, some of the follies of their time. Now that we are in the midst of a Napoleonic revival of much natural and some artificial vehemence, it is interesting to read a series of letters that bear the marks of the curiosity excited by Napoleon's name and fame during his entire career. They pick up many anecdotes concerning him, some of which are good enough to keep.

The friendships of the Edgeworths allied them with a set on which a splendid light is reflected back from Charles Darwin's life and work. It makes Maria seem extremely modern when we find her reading one of his books, but it was the 'Journal of a Voyage' (1839). She found it delightful. It is difficult for us to enter into her enthusiasm for the genius of Dr. Erasmus Darwin, but he was a faithful friend, and death found him in the act of writing the Edgeworths a letter. Josiah Wedgwood, whose daughter was Charles Darwin's mother, whose granddaughter was his wife, was another valued friend. Still another was Sir Humphry Davy, and on the list are the Herschels, Joanna Baillie, Mrs. Barbauld, Mrs.

Somerville, Malthus, Ricardo, and many others, the best the period could afford; and we have some account of them, always the kindliest possible, for, without being effusive, Miss Edgeworth was very liberal with her admiration and very loyal to her friends. Of these Scott was preëminent. Her visit to him and his to her were the two greatest events of her life, and nowhere does he shine more pleasantly than in the light of her admiring eyes. Of her acquaintances whom she could not call her friends, Mme. de Staël is the chief figure. It is a pity that Miss Edgeworth and Jane Austen never met. The index gives but one mention of the latter (p. 249), but there is a second, much more important (p. 260), criticising details of 'Northanger Abbey' as "quite outrageously out of drawing and out of nature," and praising 'Persuasion' with much ardor "except the tangled, useless histories of the family in the first fifty pages."

One naturally craves some mention of the rising generation of workers in the literary field, but what we get is very scant; not a word of Tennyson or Browning, though Miss Edgeworth lived in full possession of her faculties till 1849; not a word of Thackeray, though 'Vanity Fair' was written in 1846-'48. For Dickens there is only a sharp rebuke for his 'American Notes'; for Bulwer a sharper for his 'Eugene Aram,' while Macaulay is ill paid for his great admiration by a severe characterization of his essay on Warren Hastings in the *Edinburgh Review*. It is, however, on record that Miss Edgeworth enjoyed his 'History' very much. She was not unaware, in her own writings, of the besetting sin her father had so fondly nourished. Of 'Helen,' her last book, she says:

"It has always been my fault to let the moral I had in view appear too soon and too clearly, and I am not surprised that my old fault, notwithstanding some pains which I certainly *thought* I took to correct it, should still abide by me."

The financial success of her work is not obtruded—it is barely mentioned; but it was such as to enable her, when her brother became insolvent, to buy the estate and keep the family unbroken and the usual hospitality unspoiled. Several of those who enjoyed this hospitality wrote pleasantly about it, and Mr. Hare gives their reports—Mr. George Ticknor's as intelligent and dignified as we should expect. One publisher could not die in peace until he had arranged to give her ten or twelve hundred pounds more for one of her books than he had promised. Much lionized, she bore the infliction meekly, though she could not understand how Scott could "come out and stand on his hind legs so good-naturedly" when the lion hunters "rattled his chain." Quite different from notoriety was the subscription of Boston children who loved her books, for rice and flour to feed the starving Irish peasantry. No other tribute pleased her so much as that in her long life. It was a very happy one. "Old as I am," she wrote, "and imaginative as I am thought to be, I have really always found that the pleasures I have expected would be great, have actually been greater in the enjoyment than in the anticipation." An admirable temperament and the well-ordered and industrious habit of her life made such things possible.

The Life and Correspondence of William Buckland, D.D., F.R.S., sometime Dean of Westminster, twice President of the Geological Society, and first President of the British Association. By his daughter, Mrs. Gordon. D. Appleton & Co. 8vo, pp. xvi, 288. 1894.

ALL those who are interested in the history of geology, and many who are not concerned with that science, will welcome this memoir of Dr. Buckland. Coming as it does more than thirty years after his death, it might not unreasonably be supposed that a story so long delayed in the telling could well be left untold. It is easy, however, to see that on the contrary this delay has resulted in a decided gain by affording that element of perspective to the deeds of the man which is lacking in biographies that follow close upon the funeral.

Dean Buckland's career is especially noteworthy for the reason that he, next after William Smith, is to be regarded as the founder of British geology. To him, perhaps more than to any other of the early masters of the science, is to be ascribed the admirable spirit which has generally characterized the work of the geologists of Great Britain. Moreover, he was the first of the leaders who, by taste and opportunity, was from early youth led into this walk of learning: the others came to their work rather late in life. Born in Devon, a county abounding in fossil-bearing rocks, the son of a clergyman who, though blind, was intensely interested in natural history, Buckland naturally acquired the collector's habit which was thereafter to be the foundation of his eminent success as a naturalist. At Winchester School, and in due time at Corpus Christi College, Oxford, his development in the direction of geology was favored by the conditions of his environment. At the school he had about him the chalk, on many accounts a most attractive field; and at college Broderip and Kidd confirmed his tastes. At twenty-five he was a fellow of his college in holy orders, and in a fair way to the good fortune which led him through sundry livings to the Deanship of Westminster Abbey.

In a long service as geologist and clergyman, Buckland succeeded admirably in combining those very diverse functions; his easy success in a task which seems never to have cost him any endeavor is perhaps the best of the many proofs of his singular largeness of mind, and was in a measure due to his remarkable sense of humor. The part of his biography which deals with his term of service as professor of geology at Oxford abounds in rather grotesque fun—gambols in which the university don, his German fellow-workers, and the fossil creatures of other ages were curiously mingled. Mrs. Gordon has wisely put aside all notions of academic solemnity, and given us the funny doggerel and preposterous caricatures which were characteristic of the men and the period.

Although Dean Buckland, at the time of his death in 1856, was reckoned among the foremost geologists, as is shown by the fact that he was an honorary member of some sixty learned societies, the catalogue of his published works indicates that he was not a voluminous writer; in fact, the list of his titles exceeds that of his printed contributions to science. In the half-hundred papers and the three volumes of his independently published books, there is not much of permanent scientific value; nevertheless, there are few men who have left a more enduring impress on the science of geology. This impress proceeded largely from his qualities as a man—from his high-mindedness, his generosity, and his well-guided enthusiasm. His intense interest in vertebrate fossils led to the discovery of many of the most important reptilian remains; his studies of these, though never carried very far in the manner of the comparative anatomist, were set forth in his writings, and yet more in his lectures, in a way to attract the public. He was, indeed, the first great popularizer of science in his country. His place in the church did much to make the passage of geology through the trials of clerical disfavor comparatively easy.

Buckland's attitude towards the theory of a glacial period is interesting, and gives us a clear idea of his fine nature. When Agassiz first put forth his views, he found in the Oxford professor an energetic opponent. No sooner, however, had Buckland studied the facts exhibited in the northern part of Great Britain than he became a convert to the glacial hypothesis and the heartiest supporter of the new view. The notes of his relations to the great Swiss savant, though scanty, are among the most interesting features of this book. The most important, however, or at least the most visible result of Buckland's labors as a geologist, consists of his discovery of the fertilizing value of the so-called "coprolites." This led not only to a large production of artificial manures from test beds, but also laid the foundations of the modern mining industry in the earth phosphates. The work was simple, but its results to agriculture, already great, promise to be of vast importance in the time to come.

Although this memoir of Buckland is not well wrought out, is often discursive, and at many points needs revision by some one who is familiar with the geological part of the matter, it is a charming picture of a very notable man.

Ways and Works in India: Being an Account of the Public Works in that Country from the Earliest Times to the Present Day. By G. H. MacGeorge, M.I.C.E., late Officiating Consulting Engineer to the Government of India for Railways. Westminster: Archibald Constable & Co. 1894.

IN the early part of the century the charge was made that the Government of the East India Company could show nothing done in India for the permanent good of the country; it had simply plundered the wealth of an ancient people for its own profit, and, while preying on an ancient civilization, had given no return for what it had taken. The effects of the early work of the East India Company still remain in India, and the English rule of to-day is perhaps the most extraordinary government to be found anywhere in the world. It is an absolute despotism: in other words, it is a government in which the governed take no part. But this is not all; it is a government in which the rulers are separated from the governed by distinctions of caste and residence so great that the relation of the Government to the people is like that of the engine which drives a steamer to the passengers on board: the power of the machine is almighty, but, as every man considers himself superior to a steam engine, so every Hindu considers himself superior to his rulers.

The result of these conditions is very strange. In spite of the circumstances in which it originated and its early rapacity, there is probably no government in the world whose administration is more honestly conducted, or which is now doing more for the material good of the governed, than the present English Government of India. Even in early days it respected the religions of the native people, and it has never abused its position in the interests of sectarian or proselyting schemes. During the

last half-century it has done an immense amount of work to improve the physical condition of all India. In spite of all this, it is doubtful whether any government has ever existed towards which less loyalty was felt by its subjects.

The book before us gives an account, in rather a general way, of the various public works which have been executed in India under English direction. The author's work is not specially well done. In his preface he states that such a work can be of only limited interest to the ordinary English public, and of no interest whatever to the professional engineer; if this admission be taken as strictly true, it is hard to see why the book should have been written. While it would have been much more valuable, as well as more interesting, if written in a more systematic manner and with more regard to rhetorical effect, it will interest any one who watches, as every one should, the great changes which are now taking place in the world, and it is by no means without interest to the professional engineer. The first sixty pages are devoted to the Great Trigonometrical Survey of the country, the description of which is of rather an elementary character. The next forty pages treat of the Public or Dak Roads, which, before the construction of railroads, were of very great importance. The last ninety pages treat of Local Water Supply, the Telegraph, and Harbor Works. The two principal subjects, however, are Irrigation Works and Railways; these occupy more than 300 pages in the middle of the volume. The Indian irrigation system is a subject possessing no little interest, and the development which has taken place in the way of irrigation canals, both under the native rulers and under the English, is well worthy of study. The brief and popular account contained in this book does little more than indicate the magnitude of the subject and the careful attention which it has received; but it is a very interesting introduction to a study in greater detail. The climatic conditions of India are those of an extremely hot country with very great variations of rainfall, but the silt-bearing rivers of India have much in common with the silt-bearing rivers of North America, and the lessons of Indian irrigation should not be lost to the American irrigating engineer.

Much more space is devoted to railways than to any other one subject. The author has made the mistake of assuming too low an order of intelligence among his readers, and has devoted five chapters to explaining what a railroad is, beginning with the origin of railways in England, and ending with a description of a standard railroad track; it is hard to see what particular place this has in a book about India. There follow eight chapters which relate properly to the Indian railway system, and these are appropriate, interesting, and well worth reading, though a railroad in India does not differ very much from a railroad elsewhere, and the study of the Indian railway system is of more interest from a political and economical than from an engineering point of view. The special conditions which make the irrigation system interesting to study do not exist in the railroad system. Altogether the book contains a great deal of information, and is one which a visitor to the East would do well to take with him.

The Empire of the Tsars and the Russians. By Anatole Leroy-Beaulieu. Translated from the third French edition, with annotations, by Zénaïde A. Ragozin. Part II. The Institutions. G. P. Putnam's Sons. 1894.

TIME only confirms our conviction that in scope, intelligence, and execution M. Leroy-Beaulieu's book leaves little or nothing to be desired. If he occasionally falls into a slight error, the fact remains that to only one man in a century or more is it granted to understand and picture a foreign nation as the author has understood and pictured Russia—her government, mental, moral, and physical habits, institutions and religions. The changes and additions which the author has been obliged to make in order to bring the last edition up to date are more numerous and extensive than those required in the revised edition of Part I, already noticed by us. Of especial interest and importance is the description of the new and much-discussed institution of the "rural chiefs" (*zemskiye natchalniki*), which went into force in 1890, because at the root of the reform lay the failure of the local self-government from which such great results were confidently expected. The object of this local self-government was to train the communes, the cities, the provinces to take care of themselves. "An impartial observer," says M. Leroy-Beaulieu, "does not need the experience of a quarter of a century to discover how deceptive was the ambitious programme." He describes the village communes, in which alone the local self-government was really carried out, as "Liliputian ultra-democratic republics. Neither the townships of young America," he adds, "nor the *Landesgemeinden* of the old Swiss cantons could boast a more democratic constitution. The *muzhik* was king in his *mir*. As in all extreme democracies, it would sometimes happen that the commune would show itself both tyrannical and inclined to anarchy. There were complaints against abuse of power and complaints against lawlessness To remedy these evils the Emperor Alexander III. placed the communes under the control—one might better say 'tutelage'—of the new 'rural chiefs,' whom the law invests with functions at once administrative and judicial" These "rural chiefs" must, by law, belong to the nobility, must be appointed in a certain way, and are salaried state officials. They are judges who have swept the elective class of magistrates from the greater part of the em pire. As administrators they have charge of all that concerns the village commune, their police, even their financial affairs. "In short, the free Russian communes that Slavophils and democrats have raved over so, are declared legal minors under the control of guardians." The autonomy of the peasant communes, which was secured by the emancipation, the enforced isolation and deprivation of all influence or coöperation from the enlightened class, is thought to be the cause of the abuses in peasant administration, though the peasant has acquired two important aptitudes thereby: that of taking care of his own affairs, and of association.

In another addition to the original text, the author describes the curiously contradictory banks established in 1883 and 1885, namely: the rural bank, which lends money to the peasants below the market rates, to enable them to buy land, and the real-estate bank, established for the express purpose of lending to noble landowners on similar favorable terms, in order that need may not compel these nobles to alienate their land to the peasants! Another addition is a brief but sufficient comment on the new law of 1889, which allots salaries to the humble elected judges of the peasants' courts, who decide in questions of customary law.

We may deal with this translation more briefly than we did with the translation of Part I. It is not only good, but elegant. The translator appears to have heeded our advice to have her work revised by an American, and to have exercised more care in general. A little more care would have eliminated such blemishes as, for example, "*near on* three-fifths of the land tax"; "one of these zealots was saying [*disait*] to me," in place of *said*, in the usual defective Russian style; "incapable of taking up a protocol," instead of "drawing up," and so forth. Heedless omissions occasionally interfere with the sense. On page 6, for instance, the statement that "the power is left in the hands of the tribe or clan" does not indicate that it is a question of patriarchal government, as it would had it read "chief of the tribe," as in the original. It would have been better, on page 5, to retain the expression of the original, "male souls." Very few foreigners understand that "souls" in Russia are exclusively men, women never being reckoned in that way. Hence the omission of "male" is misleading.

The translator has also been more moderate in her addition of foot-notes to those which the author has provided than in Part I., and this is a distinct gain to the reader. On the other hand, what notes she does give are of value, almost without exception. Her appendix concerning the Artél, or Russian peasant guilds (the substance of information derived from a Cossack scientist of the Ural who came to America for the Chicago Exposition), is of particular interest. So is the note to p. 99, which explains and excuses the notorious practice of giving and taking bribes, with which Russian officials are always taunted. The public and individual complaint, she says, is never of officials "taking," but only of their "taking too much"; or of taking in cases where they should not take; or of their taking and then not doing what they promised to do and were paid for doing. M. Leroy-Beaulieu has already explained that officials are driven to take bribes by the inadequateness of their salaries. The translator adds that when an employee gives you information about your business or case, he is right in doing it, but is not bound to do it; therefore, why should he do it for nothing? If he hurries your case through out of its rightful order, it is at the cost of labor over hours, for which he is not otherwise remunerated. He is paid only for examining it in due turn.

The mere list of "Books," each containing from three to eight chapters, will suffice to show what a mine of information is this instalment of M. Leroy-Beaulieu's magnificent work: The Rural Commune and the Self-Government of the Peasants; Administration, Bureaucracy and Police; Local Self-Government; Provincial Assemblies and Urban Municipalities; Justice and the Judicial Reform; The Press and Censure; Revolutionary Agitation and Political Reforms.

New Light on the Bible and the Holy Land, being an account of some recent discoveries in the East. By Basil T. A. Evetts. Cassell Publishing Co. 8vo. Pp. xxiii, 469. Illustrated.

THE scope of this work is not precisely indicated by the title. The object of the author is to give an account of the origin of the science of Assyriology and its progress in recent years, and, incidentally, to point out where Biblical history and geography are elucidated by the cuneiform inscriptions. It ought to be said, also, that it does not represent the very latest

knowledge, since it is the reissue, with an undated title-page, of a work originally published in 1892. No reference seems to be made, for instance, to the results of the excavations at Niffer of the "Babylonian Exploration Fund" under the direction of Dr. Peters and Prof. Hilpricht of the University of Pennsylvania. It is, nevertheless, a valuable and suggestive book for the glimpses which it gives of the civilization and enlightenment that prevailed when man was in his infancy, as well as for the aid which it gives to the intelligent study of the Old Testament records.

The first of the two parts into which Mr. Evetts divides his work contains a brief account of the gradual identification of the sites of the great Mesopotamian cities during the past three centuries, and of the decipherment of the inscriptions. The story of the patience and ingenuity of the scholars who devoted themselves to this task, and whose remarkable success may almost be said to be due to two or three happy guesses, is somewhat dryly told, though it is not without a touch of romance. The description of the recent discoveries begins with those of M. de Sarzec in the mounds of Tello in the swampy region near the junction of the Tigris with the Euphrates. The buildings, sculptures, bronzes, and inscriptions found here are the products of a Chaldean civilization, "the beginnings of which belong to a period of culture probably exceeding in antiquity that of any other region." The interest in these monuments to the Biblical student lies in the fact that this is now generally believed to be the fatherland of the Hebrew race, the birthplace of Abraham. Some of the inscriptions are far older than the patriarch's time, and it is not impossible that there may yet be found contemporaneous records of the great Chaldean invasion of Syria narrated in the fourteenth chapter of Genesis, in which he took so prominent a part.

The author naturally gives considerable space to an account of the Tel el-Amarna tablets, "the most remarkable archæological discovery of the past few years." These are letters written in the cuneiform character and Babylonian language to an Egyptian king who reigned about fifteen centuries before the Christian era. A few are from allied or vassal kings of western Asia, but the most are from the native governors of Syrian and Canaanitish cities subject to Egypt. That the Babylonian language was a *lingua franca* in Egypt and Asia at this early date, and that in so many places there were scribes capable of writing the cuneiform characters, are facts as surprising as they are interesting. The correspondence shows that Syria and Canaan, in the century previous to that usually ascribed to the Israelitish conquest, were in a disorganized condition and about to throw off the Egyptian yoke. Terms are used, however, suggesting the possibility that Joshua's campaign was then in progress. Certain "Robbers" or "Marauders," who are the cause of frequent ineffectual appeals for aid by the royal governors, recall the Phœnician inscription at Tangier, mentioned by Procopius, which said that it had been made by men who had been driven out of Canaan by the "Robber," Joshua the son of Nun. The governor of Jerusalem reports that the king's land had been plundered by the Khabiri (Leaguers), a word which "might on philological grounds be conceived to be identical with the word Hebrew." Extracts are given from two of the letters of this Abdi-Khiba, in both of which he refers to the fact that "it was not my father or my mother who set me in this place, but it was the arm of the mighty king." But Mr. Evetts does not assert, as Prof. Sayce, apparently without sufficient reason, does in his recent book on 'The Higher Criticism,' that this man was a priest as well as ruler of Jerusalem; nor does he suggest that the words quoted throw any light on the mysterious personality of Melchizedek.

An interesting account is given of M. Dieulafoy's excavations at Susa, especially of the palace of Xerxes, who is now identified with the Ahasuerus of the Book of Esther. Other chapters describe the astrological and chronological records and legal deeds of the Babylonians. There is also a useful summary of earlier discoveries, as the Assyrian epics of the Creation and the Flood, the various allusions to the Assyrian campaigns in Syria and Palestine during the latter days of the Jewish monarchy, and the full identification of Tiglath-Pileser with Pul. The closing chapters give some account of the culture, religion, and language of Assyria and Babylonia.

Mr. Evetts occupies a conservative position in regard to the critical controversies of the present day, evidently (in this work at least) following the traditional method of interpreting the Biblical records where the "monuments" give no aid. The general impression left by his book is that the results of Assyriological research confirm the truth of the history narrated by the Old Testament writers in important particulars, and that we have every reason to expect, with further and more thorough explorations, a very great increase of this secular evidence to the truth of the Biblical history. It is to be greatly regretted, as seriously diminishing the value of a very useful book, that there is no index. There should have been two—a general one of subjects, and one of passages in the Bible referred to in the text, together with a condensed chronological table of Assyrian and Babylonian history.

Synnövé Solbakken. By Björnstjerne Björnson. Given in English by Julie Sutter. A new edition, with an Essay on the Writings of Björnson by Edmund Gosse. Macmillan. 1895.

For the first volume of this, a new English edition of Björnson's novels, the editor has appropriately chosen 'Synnöve Solbakken,' the first romance, though not the first story, and the real beginning for us, outside of Norway, of the author's literary career. The volume is noteworthy, too, in that it contains a long study of the writings of Björnson by Mr. Gosse. At the beginning of the book is an excellent late likeness of the author, "the most breezy and turbulent," says the editor, "the most agitated and agitating of modern men of letters."

The new translation is neither better nor worse than others that have preceded it; it is, however, not yet good enough. What we need in all the translations is more of Björnson and less of the translator. The very first sentence of the book will sufficiently illustrate the point. Word for word it reads: "In a large valley it may happen that there is a high spot, lying free on all sides, upon which the sun sheds its beams from the time it rises until it sets." Anderson's version says: "In a large valley it often happens that there is a high spot, open on every side, which the sun paints with his pencils from early dawn until twilight has faded away." The present edition has: "Amid the Norwegian valleys there are favored spots of lowlands rising into gentle eminence, lying open to the sunlight from the first of the ruddy dawn to the last beam gilding the west." There are instances of this sort innumerable, and while we do not necessarily demand a literal translation, it seems a pity either to read out of the text its original inherent simplicity, or, what is ultimately much the same thing, to read into it new refinements that have grown in quite a different soil. Even through the disturbing medium of the translations there is, nevertheless, no denying the charm of this early work, the freshness of the whole of it and the perfect verisimilitude of the language and life. Mr. Gosse justly sees in 'Synnöve' and in 'Arne,' its immediate successor, the highest development of the peasant-novel in Norway; with him we are struck, too, with their peculiar lyrical quality, and like him we gladly miss the "hortatory optimism" of much of the later work.

Mr. Gosse's introductory study is like all of his essay-writing. It has by no means a few characterizations of Björnson and his books that are as felicitous as they are facile, and that is saying a good deal of a writer whose greatest charm perhaps lies in his lightness of touch. One of these remarks is particularly worthy of quotation. "Norway," he says, "supplies the oldest and the youngest-hearted of the authors of our time, the weary Ibsen huddled above the sinking embers of existence, and the schoolboy Björnson climbing trees for mare's-nests and flinging up his bonnet in the sunshine."

In shape and make-up this initial volume leaves little to be desired. The use of the accent in Synnövé to insure the pronunciation of the final vowel is, however, a blemish, and will fail of the effect desired. The diæresis would have been better. English readers will now inevitably pronounce the word on the model of, we will say, *naïveté*, which appropriately occurs several times in Mr. Gosse's introductory study.

Pictures of Swedish Life; or, Svea and her Children. By Mrs. Woods Baker. Anson D. F. Randolph & Co. 1894.

The author, in a prefatory note, informs us that she "has lived many years in Svea's dominions, and is well acquainted with her fireside doings, and so ventures to chat about them with well-loved friends over the water"; and "chattiness" in fact characterizes this volume, which is made up of a number of sketches, apparently combined without much effort at systematic treatment. It is evident, however, that Mrs. Baker has had excellent opportunities for observing. What she tells shows great, often intimate, familiarity with life in Sweden, and a kindly appreciation which leads her sometimes to pass over, perhaps too lightly, what she is unable to approve. She sketches mostly the pleasant side of the home of Svea's children, and some of her pictures are charming. There are delineations of life in Stockholm and in the country, of public ceremonies, of Christmas festivities, of charitable and educational institutions, etc., and, in conclusion, about one hundred pages of tales from the history of Sweden; care being taken to disarm criticism by the remark that "this is no solid and scholarly bit of Swedish history, nor is it even a hasty outline of its most important events. It is rather as if one were with an American friend in a Swedish picture-gallery, and, pausing now and then before a striking portrait, should tell in an informal and familiar way the story of the original."

The few specimens of Swedish literature are printed so correctly that it is surprising, as

well as annoying, to find so many typographical errors where the attractive appearance of the volume would lead us to expect greater care in the proof-reading. To give a few instances only: "tak" instead of tack (p. 11), "föscuing" for förening (p. 26), "Lödumanland" for Södermanland (p. 99), "Fou" for Fru (p. 116), "Farboor" for Farbror (p. 117), "Arbetstagor" for Arbetsstugor (p. 191), "Arbtoga" for Arboga (p. 333). The statesman, and author of the present Swedish Constitution, Louis de Geer, is disguised as "de Gen" (p. 95), although the name is printed correctly on page 408. "Lützen," not Leutzen (p. 251), was the scene of the great battle of the Thirty Years' War. Students at the University of Lund might be surprised to hear their Alma Mater called "Sünd" (p. 249), and the English reader would, doubtless, not understand that by "upland law," on page 318, is meant the law of (the province of) Upland. What would Chaucer say to "French of Stratford Atte Browe" (p. 132)? Queen-*Consul* is the rather novel designation (p. 380) of Ulrika Eleonora, who abdicated the crown in favor of her husband. Gustavus the Fourth was dethroned in 1809, not 1792 (p. 394). Bernadotte, referred to, correctly, as Crown Prince of Sweden on page 402, is called the new King of Sweden a few lines further down on the same page, although he did not ascend the throne until several years after the events narrated. Mention is made (p. 395) of "the poems of Finn Runeberg," meaning Johan Ludvig Runeberg, a native of Finland. The reader is not informed that many, if not all, of the full-page illustrations (no reference is made to them in the text) are reproductions of paintings in the National Museum at Stockholm.

To those who have visited Sweden Mrs. Baker's book will be a pleasant and entertaining reminder of an interesting country, and will, doubtless, tell them some things which they did not know.

In the Dozy Hours, and Other Papers. By Agnes Repplier. Boston: Houghton, Mifflin & Co.

It is soothing to the reader's sensitiveness to foreign criticism to know that this volume of Miss Repplier's essays, collected from her contributions to the *Atlantic*, is meeting with appreciative and even enthusiastic notice from the English reviews. Here, once again, is a writer of our own nurture for whom the ordinary standards of criticism need not be readjusted or adapted to scale; who does not employ dialect; whose idiom is not even "racy of the soil"; who interprets no "phases," and has no care to express the inarticulate; who, on the contrary, gives utterance to only the most clearly defined thoughts, in admirably definite, clear, and well-turned sentences; whose mental background is filled with the literary imagery that is the common inheritance of the English-speaking race, and who fortunately did not begin, when childhood and youth were over, to consciously strain after, and all as unconsciously fail of, "culture." Miss Repplier's point of view, as is well known, is as free from utilitarianism or partisanship as it is from provincialism. Her sense of humor spares neither "reforms" nor her own sex; neither the over-enlightened parents of "these exacting days," who feel that "even a young child is deeply wronged by subjection," nor the attitude of those "impetuous creatures" who seem to assume that "the seven deadly sins grow less malignant in woman's hands." Her pages can claim no merits of newer invention than those perennial graces of style and imagination that have charmed readers in the past, and must, apparently, be depended on to relieve the dulness of emancipated humanity in the future.

The sources of Miss Repplier's strength as an essayist are, however, also the sources of her weakness. Her mind is so well stored that her own individuality is oftentimes pushed, as it were, into the background; between her own intelligence and the reader there constantly flit, like unwelcome intruders upon a tête-à-tête, the opinions of this and that remembered favorite of the world of letters. Thus, in the characteristic essay on "Lectures," leading one on, by its witty and ironical protest against contemporary fads, to hope for the personal equation of the writer to its end, it is a trifle tantalizing to be finally put off with an "as for Lamb," however graceful the account which follows of that prime favorite's attitude towards the subject. If ten years hence Miss Repplier should read herself, and comment on herself as she appears in print, it is easy to fancy how charming the comment might be. For life to her is like wine: to thoroughly please her palate, it must have been bottled in works of the imagination. If there has been time for some dust and cobwebs to gather on the vessels, so much the better. "The old order passeth," she writes, "and we are sorry in our hearts, having loved it well for years, and feeling no absolute confidence in its successor." When it is fresh from the press, she does not test the flavor of existence with the same degree of connoisseurship.

It is pleasant to speculate what the result might be if Miss Repplier's intimacy with human nature were as close as her intimacy with books—her interest in the world at large as sympathetic as her interest in the world in the library; or if the prejudices of the men and women of her own day and generation had seemed to her as natural, their foibles as amiable, their inconsistencies as endearing, as those of the heroes and heroines of the days of Cervantes, Richardson, or Scott. Her essay on "A Kitten" proves her power of throwing the fascination of the living thing into a few brief pages; one would fain see it exercised on higher types—in presenting more clearly the individual features of her own mind. As it is, a certain second-handedness of view, and even a suggestion of too constant reference to the note-book, mar the fine quality of her work.

Woman's Share in Primitive Culture. By O. T. Mason, A.M., Ph.D. New York: Appletons. 1894. pp. 295.

This book is written in exemplification of the fact that the beginnings of all the great industrial arts are due to women. If we divide historic periods into those of militarism and industrialism, we may with equal appropriateness distinguish the two sexes in early times as the military and the industrial sex. Division of labor between the sexes began with the invention of fire-making: the woman stayed by the fire to keep it alive, while the man went abroad to fight the enemy and to bring home wild beasts for food. Man has been the inventor in every murderous art; woman, at the fireside, became the preparer and the preserver of food, the weaver, the skin-dresser, the potter, the basket-maker, the domesticator of animals, and later the agriculturist—in a word, the inventor of all the peaceful arts of life. It was the gradual pressure of her insistence upon the value of the product of her first planted food-grains which turned mankind from the nomadic savage into the settled tiller of the soil. Only after the necessity for warfare had grown less urgent, and at the same time the development of the industrial arts had reached such a stage that the labor of many hands could advantageously be applied to a single piece of work, did the arts of peace become the province of men. Co-operation and the division of labor which it permits were not possible for "her who presides at the hearthstone," and hence the later developments of the arts of which she had laid the foundation passed into the hands of the other sex.

This is a thesis which a scanty knowledge of the history of primeval times enables one to perceive to be true, and which has been frequently distinctly stated, if somewhat too grudgingly, by the unfair sex. Prof. Mason deserves great credit for the cordiality and enthusiasm with which he here sets it forth. He dedicates his book "to all good women, living or dead, who with their brains or by their toil have aided the progress of the world," and he is of the opinion that "whether we regard the history of the remotest past or the diverse civilizations of the present, the emancipation and exaltation of women are the synonyms of progress." The reproduction of the numerous accounts of travellers describing primitive processes of manufacture among the women of savage tribes of low and lowest degree makes a very interesting volume.

The more than equal share played by women in the invention and spread of language has not been elsewhere set forth with so much clearness. Savage men in hunting and fishing are much alone, and have to be quiet, hence their taciturnity. Women remain together all day long, and have constant occasion for comparing the results of their experiments in the manifold problems which occupy them. Prof. Mason quotes this passage from Payne's 'History of America':

> "The steps by which language was developed are still obscure; but it may reasonably be concluded that the food-quest had a considerable share in the process, and that not long after emotional exclamations and demonstrative names came primitive adjectives signifying 'good' and 'evil,' applied to animal and vegetable species with reference to the purpose of food, in the sense in which the African guide classes all plants into 'bush' and 'good for nyam' (the latter including the eatable ones and the former the residue). In the discovery of the qualities of plants, women had the largest share, the males being occupied in hunting"

And Prof. Mason points out that what is here said concerning the food-quest would be equally true of all the substantial occupations of savage woman's life. The Mexicans have a proverb which says "A woman is the best dictionary"; a confession based upon an induction made by the aborigines of that country centuries ago. With the exception, perhaps, of the classes of society in which men have had access to special means of training denied to them, women are still the best dictionaries, talkers, and letter-writers. The fact that silly women talk too much has made woman in general a butt for ridicule, and has obscured the fact that women who are not silly have far greater facility than men in clothing the contents of their minds in fluent, graceful, and expressive speech.

Aside from the merits which we have dwelt upon, this book leaves much to be desired—in point of style, of argument, and even of grammar. It is the first volume of "The Anthropological Series," edited by Prof. Frederick Starr of the University of Chicago. The illustrations are admirable.

Essays by Joseph Mazzini, most of them translated for the first time by Thomas Okey. Edited with an introduction by Bolton King. London: Dent.

No better proof of the vitality of Mazzini's doctrines could be had than the fact that very recently a new six-volume edition of his works and two separate single-volume editions of select essays have been printed in English. And yet Mazzini has been more than twenty years dead, and much of his most characteristic work was written before 1840. It would be interesting to investigate the sources of this vitality, and to show how far Mazzini's views could be used to combat and correct the exorbitant theories of latter-day Socialists; but our present purpose is simply to call attention to this latest volume, in which readers who have not hitherto known Mazzini will find much that fairly represents him. The selection embraces only essays on political and social topics, and none of his critical essays; so that a stranger could hardly infer from it how admirable a critic of literature Mazzini was. His review of Carlyle's 'French Revolution,' for instance, establishes his right to rank among the half-dozen original and penetrative critics of his time. But since the social question is to-day the most absorbing question, it was not improper to mass in a single volume Mazzini's utterances thereon. The student of the intellectual processes of genius will see in the essay on "Interests and Principles" how early Mazzini formulated his system, resembling in that respect two other men of very diverse genius—Calvin and Berkeley.

The translations merit the praise of not reading like translations, and, so far as we have observed, they are accurate. But Mr. Bolton King's introduction is only half satisfactory. His general remarks on Mazzini's importance in recent European history may be commended, but his references to Mazzini's participation in Italy's struggle for independence are singularly superficial and inaccurate. It would be hard to pack more misstatements into two short pages than Mr. King has done on pp. xxiii, xxiv. To imply that the present lamentable condition of Italy may be due to the policy originated by Cavour, is like implying that McKinleyism and all the later corruptions fostered by the Blaine-Republican party should be charged against Abraham Lincoln. A novice need not be told that since 1861 the politicians who have governed Italy have persistently disregarded the spirit of the great traditions bequeathed to them by Cavour. But, after all, it is not the editor, but Mazzini himself, with whom the reader of this volume will spend his time. The book is daintily printed and bound, in significant contrast to the rude type and paper which served for the first surreptitious edition of many of Mazzini's tracts.

Concise Anglo Saxon Dictionary. By J. R. Clark Hall. London: Sonnenschein; New York: Macmillan. 1894.

THE dolorous condition of Anglo-Saxon lexicography makes anything in the way of a new glossary welcome, and accordingly we extend our resigned greetings to Dr. Hall's Dictionary. It is impossible to give a quite enthusiastic reception to a work which laboriously announces itself, in an extended preface, as published in a hurry, before the compiler was ready, in order to anticipate the wants of the Oxford School of English, and which, in its very prospectus, proclaims the necessity, as well as the hope, of a revised edition. Dictionaries (except Dr. Johnson's) are not commonly resorted to for amusement; but there is one article, well settled in our Anglo-Saxon lexicons, which has already contributed much to the gayety of scholars. We refer to *leso*, entered as an indeclinable feminine noun, and defined by the Latin *numen*, with a citation of the proper page and line of the Wright-Wülcker 'Glossaries.' In the millennium, Anglo-Saxon lexicographers may spoil our fun by discovering—what has been the common property of other scholars for a dozen years—that this supposed Anglo-Saxon noun is but the ablative singular neuter of the Latin participle *laesus* (spelled in mediæval fashion, *leso* for *laeso*), and that the *numine leso* on which the entry in Wright-Wülcker is founded is but Virgil's (*quo*) *numine læso*, from the beginning of the 'Æneid.' The Saxon glossator who entered these two Latin words in his list as a lemma, and either gave up the puzzle (small blame to him!) or else wrote an explanation which has perished, little suspected that he was tempting his successors to set up a Latin neuter participle as an Anglo-Saxon feminine noun. From the fact that Dr. Hall has been too conservative or too careless to disestablish this venerable blunder, our readers may judge of his vigilance in the nice questions of Saxon lexicography. To speak plainly, though he has attempted to exploit Wright-Wülcker, he has given little heed to what has been done to rectify and emend the corruptions and other errors of that work, so that *laeso* is not the only Latin word that does duty as Anglo-Saxon in his dictionary. We hope that the second edition will come quickly, and will be prepared with greater care than the first.

Yet we are loath to carp at this dictionary, even in its present vastly imperfect form. The plan is a good one, and junior students and amateurs will find the copious vocabulary offered them, with its brief definitions, all printed in legible type and compressed within a moderate compass, a valuable addition to their stock of guide-books, while even specialists, however vexed at oversights, will be grateful to the compiler for having registered many words ignored by his predecessors. The book will be very useful. Let Dr. Hall revise it as soon as the destinies decree!

Natural Rights: A Criticism of Some Political and Ethical Conceptions. By David G. Ritchie, Professor of Logic and Metaphysics in the University of St. Andrews. London: Sonnenschein; New York: Macmillan. Pp. xvi, 304.

PROF. RITCHIE'S apology for setting his teeth to a well-gnawed bone is not necessary: he has found some shreds of meat on it yet. Indeed, to stick to the figure as a dog would to the bone, not a little marrow is laid bare for the first time under his crunching. Leaving to Bentham the work of logical dissection, to Burke that of passionate and thrilling denunciation, to Sir Henry Maine that of showing what that ancient law really was which the French theorists identified with the flights of their metaphysic wit, Prof. Ritchie takes for his own the humbler task of tracing the historic evolution and significance of the theory, and of each of the leading examples, of natural right—that prime article of the political creed of a hundred years ago in France and America. Following the lead of M. Charles Borgeaud, he finds in the theological jargon of the English "Levellers" of the seventeenth century the main root of the "principles of '89"; itself a growth in the soil of the Reformation, it was not transplanted to France until Locke had given it philosophic cultivation. In Rousseau's garden it grew to what we know. Prof. Ritchie remarks with much justice:

"No great writer perhaps has suffered more than Rousseau from having his views judged by his weakest writings. The 'Contrat Social' is a book much more talked about than read, and the prevalent opinion about Rousseau's social theories is derived from the paradoxes of his early prize essays. . . . But even in the 'Discourse on Inequality' he recognizes that the state of nature 'has perhaps never existed, and probably never will exist,' and that when he speaks of it he is using a hypothetical argument and not attempting to describe the actual original state of mankind."

Prof. Ritchie does not take leave of the historic evolution of the natural-rights doctrine in '89; he shows its existing vitality to be in the form of contemporary socialism. In fact, with only some slight changes in form—such as the transition of the *droit du travail* into the *droit au travail*—the old asseverations of the rights which nature, as opposed to society, gives to man are to-day urged by socialists with as much passion, if not with the same aim, as by revolutionaries and republicans a hundred years ago. All these rights may be summed up in the single "Right of Pursuing and Obtaining Happiness," which might be taken as a good definition of the aims of socialism—that "large order on the bank of Providence," as Prof. Ritchie calls it. In his criticisms on the modern applications of the natural-rights theory he is generally acute and satisfying. His turn for happy characterization may be inferred from his reference to "those two scholastic theologians, Mr. Henry George and Pope Leo XIII." As a final citation, with some painful local bearings for New Yorkers just now, we give the following: "Reformers are always apt to look forward to 'living happily ever afterwards' when once the great crisis is over. But it is only in old-fashioned stories that trouble ends with the wedding-bells."

Amphioxus and the Ancestry of the Vertebrates. By Arthur Willey, B.Sc. [Columbia University Biological Series. II.] Macmillan. 8vo, pp. 316, illustrated.

THE high degree of excellence attained by the first volume of this series obtains likewise in the second. Both are very creditable to American science, and will exert a beneficent influence on subsequent attempts in behalf of thoughtful readers. Branchiostoma (Amphioxus by a later name), though in the average hardly larger than a wooden match, is one of the most important creatures known to scientists, as is sufficiently evident from the mass of literature devoted to it. In systematic position it lies lower than the Vertebrates, near the Ascidians and the Annelids. Some authorities consider it to be a connecting link, an ancestral form of Vertebrate. A safer position is that adopted by this author, making it a very ancient offshoot from the actual vertebrate ancestor, or a close relative. Parallelism in evolution is here given a prominence unusual in these days of search for genetic affinities. A much greater external resemblance between Ammocœtes (the larva of the lamprey) and Branchiostoma notwithstanding, the author would make the relationship between the latter and the Ascidians to be the closer. He defines these last as more or less Branchiostoma-like animals, adapted to a sessile habit of existence. Comparing the Annelids and the Vertebrates, it is found that the closer the su-

perficial resemblance, in somites, segmental organs, etc., the more perfect the parallelism in evolution and the more remote the genetic affinity. It is decided to be most likely that its organization would place the proximate ancestor of the Vertebrate between the Ascidian tadpole and Branchiostoma, while the organization of the primordial ancestor would be worm-like, approximately on a level with that of the bilateral ancestors of Echinoderms. Clear and comprehensive in descriptions, well illustrated, and cautious in conclusions, the book forms an excellent monograph for the student. Embryology and anatomy are brought together from all sources, the author himself making substantial contributions, and, besides Branchiostoma, Annelids, Ascidians, and Vertebrates are included.

In the historical matter the date of Pallas's discovery of the first species should be 1774 instead of 1778. As the author mentions, the name Branchiostoma was bestowed two years earlier than Amphioxus; individual preference is apparently the reason for present use of the latter. The confusion arising from this use is illustrated on p. 40, where, after the heading "Species and Distribution of Amphioxus," that title is displaced by Branchiostoma throughout the synopsis. The account of distribution and habits is to be criticised, because it takes no notice of the remarkable species, B. pelagicum, secured by the *Challenger* expedition, described and figured by Günther in 1889, from thousand-fathom water, in the open ocean, a few degrees north of Honolulu. That species is the more worthy of remark as it differs so radically from the others in dwelling-place, and because the lack of buccal cirri attests wide differences in habits.

A Treatise on Industrial Photometry, with special applications to Electric Lighting. By A. Palaz, Sc.D., Professor of Industrial Electricity in the Science Faculty of the University of Lausanne. Translated from the French by George W. Patterson, jr., Assistant Professor in the University of Michigan, and Merit Rowley Patterson, B.A. London: Sampson Low, Marston & Co.; New York: D. Van Nostrand Co. 1894.

ELECTRIC lighting has given a great stimulus to the study of the efficiency of various methods of illumination. In the new methods of distributing light from central stations, electricity was brought into forcible contrast with gas, and standards of illumination immediately assumed an important commercial value. Incandescent lights and arc lights are rated as so many candle-power; and the subject of photometry, instead of being treated in a few paragraphs in text-books of physics, as it was twenty years ago, has now this voluminous treatise of 318 pages devoted to it. Indeed, there is enough theory and practice in this treatise to warrant months of study in a technical school. The author has collected the large number of researches on this important subject which have appeared in the various technical journals, and has moulded them into a valuable treatise. The photometers of Rumford and Bunsen were once the principal and indeed the only important photometers; there are now at least twenty forms of photometers, and in place of two or three standard lamps there are now as many as there are standard photometers. The untechnical reader will find much interesting information in Mr. Palaz's treatise. On the subject of our extravagant methods of illumination the author remarks that the efficiency of an incandescent lamp is only about 1 per cent. of the energy of the coal which drives the dynamo machine.

BOOKS OF THE WEEK.

Allen, Grant. The Woman Who Did. London: John Lane; Boston: Roberts Bros. $1.
Bacon, Susie L. A Siren's Son. Chicago: C. H. Kerr & Co. 25 cents.
Beck, Mme. Berthe. French Verb Form. W. R. Jenkins. 50 cents.

HENRY HOLT & CO., N. Y.

HAVE READY:

TEN BRINK'S FIVE LECTURES ON SHAKESPEARE.

Translated by JULIA FRANKLIN. Contents: *The Poet and the Man; The Chronology of Shakespeare's Works; Shakespeare as Dramatist, as Comic Poet, as Tragic Writer; Index to Works Mentioned.* 12mo, gilt top, $1.25.

A HISTORY OF THE NOVEL

PREVIOUS TO THE SEVENTEENTH CENTURY. By F. M. WARREN, Professor in Adelbert College. 12mo, gilt top, $1.75.

KALIDASA'S SHAKUNTALA.

Translated by Prof. A. H. EDGREN. 16mo, $1.50.

JACK O'DOON.

An American Novel by MARIA BEALE. Narrow 16mo, buckram, with Frontispiece. (Uniform with "The Prisoner of Zenda.") 75 cents.

The story of a great sacrifice. It is quick in action, with stirring episodes on land and sea. The scene is laid on the coast of North Carolina. The picture of the old sea-captain's peculiar household is new in fiction. The tragic climax is original and impressive.

SLUM STORIES OF LONDON.

(NEIGHBORS OF OURS.) By H. W. NEVINSON. (Uniform with "The Prisoner of Zenda.") 75 cents.

"The newest and freshest addition to English romance since Kipling started in to conquer the reading world."—*Philadelphia Inquirer.*

Yale Mixture.

A GENTLEMAN'S SMOKE.

You won't know the luxury of Pipe-Smoking until you use Yale Mixture.

A two-oz. trial package, postpaid, for 25 cents.

MARBURG BROS.,
The American Tobacco Co., Successor,
Baltimore, Md.

To Librarians, Book-Lovers, and Booksellers.

Our NEW CATALOGUE of RARE and CHOICE BOOKS, comprising works on architecture, biography, belles-lettres, the drama, first editions, Shakesperiana, rare French Books, works of art, etc., etc., will be sent, postpaid, upon request.

☞ Attention is called to this valuable collection.

HAVE JUST PUBLISHED:

DR. JUDAS.

A Portrayal of the Opium Habit.

By WILLIAM ROSSER COBBE.

Cloth. Price $1.50.

The author, a well-known Chicago journalist, has depicted with an unusually facile pen and with rare descriptive power the baneful effects of opium upon the mental, moral, and physical nature of the habitue. Specially full is his treatment of the diseased condition of Attention, Memory, and the Will; the portrayal of fantastic dreams and double vision, and the scourges of conscience under the stress of opium. Himself a victim of this terrible habit for nine years, he writes from personal experience with what he aptly terms

"THE JUDAS OF DRUGS,"

stripping the habit of its glamour and deceit, and revealing to the uninitiated the disastrous consequences of indulgence in this most dangerous of addictions. Due attention is also given to other toxic agents, as cigarettes, chloral, cocaine, hasheesh, etc.

To the GENERAL READER this book will be of interest because of its fascinating literary style, while it will prove of incalculable value to the PHYSICIAN because of its graphic portrayal of the effects of opium upon the body; to the LAWYER for the important bearing of its facts upon jurisprudence, and to the TEACHER as a guide in warning the young against the baneful influences of all forms of pernicious and enslaving drugs.

OTHER NEW BOOKS:

SOCIAL GROWTH AND STABILITY.

A Consideration of the Factors of Modern Society and Their Relation to the Character of the Coming State. By D. OSTRANDER, author of "The Law of Fire Insurance." Cloth. Price $1.00.

This work discusses present industrial and social questions, as capital and labor, the duty of the state in reference to furnishing employment, the control of the means of production and distribution, etc. It seeks to promote a better understanding of social relations and to stimulate effort in behalf of the wage earner.

The *Boston Courier* says: "The book will be certain to be of great benefit to all who require fresh stimulus and a new awakening in the present days. It is of real depth and worth, the fruit of much study and thought, and provocative of serious reflection."

OTTO'S INSPIRATION.

A Novel. By MARY H. FORD, author of "Which Wins?" Cloth. Price $1.00.

The *Boston Home Journal* says: "A purer or more wholesome story we have never read. The hero's trials, his success, and his professional triumphs are set forth with the most delightful effect. This charming story is of high literary merit, and while it will be enjoyed by all lovers of good books, it will be especially attractive to those interested in music."

FREYTAG'S TECHNIQUE OF THE DRAMA.

An authorized translation, by ELIAS J. MACEWAN, M.A. Cloth. Price $1.50.

The *New York World* says: "Its exposition of dramatic art and composition is one of the clearest and best that has yet been written."

Public School Journal, Bloomington, Ill., says: "We have read nothing that compares with it in giving a clear idea of the essentials of a good drama and of that which constitutes good acting. The ablest exposition of the drama that has appeared in modern times."

The Nation.

NEW YORK, THURSDAY, FEBRUARY 21, 1895.

The Week.

THE vote in the House on Thursday on the gold-bond resolution was primarily and essentially a heavy blow to the public credit; yet it has been treated as if it were merely a rebuff for President Cleveland. "Beaten again!" cries the exultant *Tribune*, dancing with the other wreckers on the shore where they hope to see the national credit dashed to pieces. No matter if we turn out a nation of defaulters, provided Cleveland is not allowed to have his way. Reduced to its simplest terms, that seems to have been the main motive in the minds of the members who voted to throw away $16,000,000 and further shock and estrange the confidence of the financial world. If the President urged them to be sane and honest, that made plain their duty to play the harlequin and the cheat. This is really about the greatest compliment that could be paid to Mr. Cleveland. Scarce another President has had the good fortune so to identify his own personality with national honor and financial stability as to make all enemies of the public credit *ipso facto* his enemies. Nor has he any reason whatever to care for their raging. He is master of the situation, and all the howling of the jackals cannot alter the fact that he is both able and determined to maintain the Government's plighted faith. While his personal enemies and the bat-eyed partisans are shrieking out "Beaten Again," the country is thanking its stars that he is not beaten, and that its honor and stability are safe in his hands.

Politically, Thursday's vote was chiefly significant as revealing an alarming division in the Republican party. Even under Mr. Reed's urging, but 31 Republican votes were secured for the bill, while 63 were cast against it. With 89 Democrats voting in the affirmative and 94 against, little is left to choose between parties. When the Duke of Kent visited the Dey of Algiers in 1818, the latter potentate, in an effort to be complimentary, said: "Your father is the greatest pirate in the world, but I am the next." The Western Republicans in like manner admit that the Democrats have gone further than they have for cheap money and broken credit, but they are doing their best to come in a close second. But, says Presidential candidate Reed, the Republicans of the East and the West have always found some way to get along together, and they will now. Not until some way of making fifty cents equal a dollar shall be discovered. There is now every sign of an irrepressible conflict in the Republican party on the money question. The bold talk and votes of the Western Republicans on Thursday are the first move in an aggressive campaign to nominate, if not an outright free-silver Republican candidate for the Presidency, at least a flabby and wabbling candidate. Mr. Reed will find himself consumed between two fires. The Western men will not have a leader whom a telegram from Boston bankers can make turn a complete summersault in two weeks. The Eastern men will not have him if, as the next Speaker, he appoints a shaky committee on coinage. There can be no good-Lord good-devil leadership in this currency matter.

We do not think that American history records the existence of a more brutish Congress than the one now sitting at Washington, or one that the people will be more glad to see dispersed till the day of judgment. The majority of its members are utterly at variance with public opinion touching the recent loan by which a suspension of specie payments was averted. They do not know what the people are saying and thinking about them. The truth is, that the President is sustained by nine-tenths of the business men and of the thinking men throughout the country. These men make public opinion. They constitute public opinion. If there was any way by which the vote of Massachusetts, for example, could be taken to-day on the question of sustaining the President, he would receive an enormous majority. It is only because no such vote can be taken that the wretched Lodge dares to throw *camouflets* at him, and the wretched Gorman to insult him by introducing a bill to annul a clause of the contract which he has made with the bond syndicate. This is the clause which gives the syndicate the first chance until next October to subscribe for a new issue if another one should be necessary. Gorman's amendment proposes to authorize the issue of 3 per cent. exchequer bills to the amount of $100,000,000, to meet temporary deficiencies of revenue—a measure entirely proper in itself, but he has added a provision that all future bond sales shall be made in pursuance of public advertisement, in the teeth of an existing contract made by the secretary of the treasury with the President's approval, and officially communicated to Congress. In other words, Gorman wants the President to cancel and repudiate his own contract. Of course he will not do so, even at the risk of losing an appropriation bill.

Senator Sherman exhibited himself on Monday as a stickler for forms, when he insisted that the negotiation of loans was the work of the secretary of the treasury and not of the President. This question involves an interpretation of the Constitution. There is nothing which takes the management of the finances out of the scope of the clause of the Constitution which says that the President shall take care that the laws be faithfully executed. Every law of Congress must be interpreted with this provision in view. This whole question was fought out during Jackson's administration and was decided in the forum of public opinion, then and since, in favor of the President's power to direct what the secretary of the treasury shall do—not to compel him to violate the law, but to control him within the limits of the law. The law at that time authorized the secretary, in his discretion, to remove the public deposits from the Bank of the United States, requiring him merely to give his reasons for doing so to Congress. President Jackson desired that Secretary Duane should remove the deposits, but he refused to do so. He also refused to resign his office. Accordingly the President removed him and appointed another secretary who did remove them. It was the great question of the day. It overshadowed everything else in politics for the space of six years. It was not a question that could come before the courts in any way. It was one to be decided by the people at the polls, and they decided it in favor of the President at every opportunity they had for voting upon it until the other side abandoned the field. If there were any such opportunity now, they would vote as they did then. It stands to reason that if the President has the power to remove a secretary (which is not denied), he has the power to direct what the secretary shall do within the limits of the law.

Secretary Carlisle's statement regarding the condition of the Treasury reveals the fact that there has been an actual contraction of the currency during the past twelve months of nearly $80,000,000. On January 1, 1894, the amount of United States notes and Treasury notes held in the Treasury was $6,289,086; on January 31, 1895, the amount was $85,627,989. All these millions of the people's precious money locked up out of their reach! Why, this is twice the amount of greenbacks that Secretary McCulloch retired. It was something terrible for him to do it, and the law authorizing it had to be repealed. A contraction of the currency could not be thought of without shivers. It cannot now by the *Tribune*. But here is a contraction of $80,000,000 which has gone on unperceived and unfelt, while the really great financiers of Congress and the newspapers have been straining every nerve to prevent anything of the kind. Yet these men will go on just as firm as ever in the belief that their mothers bore Solons.

The Alabama lawmakers have finally concluded that it is better to save the State $100,000 a year in interest on the public debt than to "vindicate" silver. The lower branch of the Legislature recently insisted upon striking out from a Senate refunding bill a clause providing that the new bonds should be made payable in gold instead of coin, although it was conceded by all that 1 per cent. in interest could thus be saved, and although it was found two years ago that new bonds could not be placed at a lower rate than the old ones without this provision. The only excuse given for their attitude by the Representatives who opposed the gold clause was the assertion that it would "put the people of Alabama in gold shackles." The Senators were not moved by this plea, and insisted upon the gold provision, and the House on Friday, on second thought, concurred by the close vote of 42 to 40. The Alabama Legislature thus puts to shame the example of Congress, which has just refused to save the nation half a million dollars a year for the next thirty years in the same way.

The House members of the conference committee on the diplomatic appropriation bill refuse to accede to the demand of the Senate for the insertion of an item appropriating $500,000 to begin work on a cable between the United States and the Hawaiian Islands. It is to be hoped that they will stand firm. The advocates of the scheme ask only $500,000 now, but they estimate that the total cost of the line would be at least $3,000,000, and all experience goes to indicate that it would turn out to be a great deal more. The reason they are urgent about the $500,000 is that the appropriation of this sum would commit the Government to carrying the project through. There is no possible excuse for borrowing money to lay a cable that we do not need, and there is no public sentiment in favor of such foolish extravagance. The people will sustain the House in blocking this job.

The Senate committee on the subject has again made an unfavorable report on the resolution which has passed the House for the submission of a constitutional amendment providing that Senators shall be elected by the people, instead of by the Legislatures. No matter how large a majority such a proposition may secure in the lower branch, most of the Senators will oppose it, although it is not without advocates in that branch. Two motives conspire to array the Senate in the negative. One is the natural conservatism of that body, which prejudices it against any change of methods, and especially so radical a change as is here proposed. The whole force of tradition and precedent is on the side of the existing system. The strong argument which may be made for it by high constitutional authorities, like ex-Senator Edmunds in his recent article in the *Forum*, is reinforced by the practical objections to a change of not a few Senators, who have succeeded in getting elected by a Legislature, but doubt whether they would be as fortunate if they submitted their claims directly to the people, as a man must do who asks a nomination from the State convention of his party.

Mr. Everett made a brief but eloquent appeal to the House at Washington on Friday, the 15th inst., to pay the just claims on us—adjudged to be just by the Court of Claims and the committee on claims—to increase the absurdly small salaries of our higher officials, especially of our ambassadors and ministers abroad, and of our cabinet ministers and our judges, before spending an enormous sum in battle-ships. He pointed out further that the enemy that is lying in wait for us "is not Great Britain or France; it is not Austria or Chili. That enemy—that foreign enemy, that un-American enemy—is in our great cities. The foreign enemy we have to dread is planted in the streets of our great cities—your city and mine. There is the problem for us. There is what demands the expenditure of our surplus." He spoke also of the way in which the public mind is being familiarized with the idea of war by the constant use by our public men of such phrases as "in case of war," "in the event of war." From hearing them talk, one might get the idea that we were a little state like Switzerland or Denmark, surrounded by mighty enemies eager to dismember us or get a whack at us, or had, like Germany, a powerful enemy on our border burning for revenge, by launching half a million of men across our frontier. So far has this gone that many people now think of the expansion of our commerce as chiefly interesting as a probable cause of war. Even the Nicaragua Canal attracts many solely as something to fight England about. They would not care a straw for it as a neutral highway of commerce, but as a probable cause of hostilities with some European power they chuckle over it. The cause of this strange, semi-barbaric state of mind is undoubtedly—apart from the love of combats and fights which always prevails among youths—the tendency of patriotism, like everything else, to move in the line of least resistance or trouble. True and large patriotism would demand a diligent, unflinching solution of all the tremendous domestic problems which beset us, in finance, in administration, and in legislation. But such solution would make heavy inroads on the time, patience, labor, self-restaint, and money of every man of us. Consequently, we naturally prefer to show our patriotism by hiring men, mostly foreigners, to get up spectacular fights for us in big ships on the sea, which will make us glow without risk and sell our "extras."

Ex-Senator Edmunds made some excellent points in his argument against the constitutionality of the income tax before the United States Court of Appeals in the District of Columbia on Thursday. He said the tax divided the community into two classes, one of which paid and the other did not. But if Congress had the power to tax people with incomes of over $4,000, and let those who had incomes under that amount escape, why had it not the power to tax people with incomes under $4,000, and let those who had more escape? If Congress did this, what should we say? Also, would a tariff act be constitutional which allowed persons to import goods worth less than $100,000 in the aggregate free of duty, while making all who imported more than that amount pay heavily? The want of uniformity is, in fact, the most serious objection to the tax on which the highest court has not yet passed. The Supreme Court has, however, found that at the foundation of the Government the only direct taxes known were the land tax and the capitation tax. The income tax was not thought of until long after. It has, therefore, concluded that these were the only direct taxes that could be known to the Constitution, and that any other direct tax that might be concocted must, for constitutional purposes, be called by some other name, and be treated as indirect. The question, it says, is one of nomenclature, not of fact. The income tax is the directest direct tax the wit of man could devise. Every tax that a man has to pay which he cannot evade by failure or refusal to do or leave undone, to purchase or to use, is a direct tax. So say the lexicographers, so say the economists, so say the people who invented the language and express themselves in it. But the Supreme Court says—Not so; that may be the meaning of "direct" for all other purposes of life; for the purpose of taxation in the United States, "direct" must be held to mean "indirect." Those who think differently have not "legal minds." Every government has and must have the power, not only to issue paper money, but to stamp words with a legal as distinguished from the popular meaning, and raise money thereunder.

A correspondent writes to us:

"Supposing the predatory income tax to be declared constitutional, will you kindly tell your readers what steps the Government would be obliged to take to collect it, and what you think its success would be if persons liable to pay the tax generally possessed enough of the old tea-party spirit to ignore it? I understand that a great many propose to try the experiment."

There is no doubt that the income tax has been imposed for predatory purposes, that is, for the purpose of compelling one set of people to bear the burdens of another set of people. But nevertheless it is law, and consequently a general refusal to pay it would be anarchical and a direct encouragement to anarchy. It is true it is

an attack on property, but then the only guarantee we have for the security of any property at all is the readiness of the people to obey even laws of which they disapprove. If we were to allow ourselves to select from the statute-book the enactments which we would treat as binding, and disregard the others, the confusion would be frightful and the state would not long hold together. It is quite true that occasions may arise when disobedience to law becomes a duty, but they can arise in a free country only when there is no hope of repeal or legal redress. When we see how frequently popular opinions vary and power passes from one party to another in America, we should have to be very despondent indeed in order to conclude that the income tax would be perpetual. We, too, who voted to put the Democrats in power must stand up like men and take our medicine. Nobody in this part of the country who voted for them had the smallest idea that they had an income tax in their pockets, for they took care not to mention it. They played a trick on us, but we have no right now to upset the Government to atone for our own credulity. The work before us is to try to get the Republicans to abolish the tax, as the most effective tool ever put in the hands of anarchists, socialists, Populists, and money cranks of every description. We say all this on the supposition that the Supreme Court will again declare it constitutional. It has already declared it constitutional by using the term "direct tax" in a sense unknown to the philologists, to the people, and to economists, which is in itself a dangerous thing. If we cannot tie courts up to the dictionary, we are at the mercy of judges.

Accounts differ as to the number of brave men who obeyed Platt's call for a council of war at the Fifth Avenue Hotel on Sunday, but we are disposed to be liberal and accept the highest number given, thirteen, including Platt and his son, as the accurate total. There were some notable absences, but the determined spirit of those who were present atoned for the poverty in numbers. "Every voice was for war," we are assured by Mr. Platt's favorite organ, and "it was agreed that the time for conciliatory measures with Mayor Strong had passed." The causes of the war were clearly stated. Mr. Lauterbach, chairman of the Platt Republican county committee, informed the council of war that he had in person twice asked the mayor to appoint a certain man to office, stating each time that the candidate was endorsed by the county committee, and that the mayor had replied each time that he could not appoint the man, because he had some one else for the place. Mr. Lauterbach said it was evident from this conduct that the mayor did not intend to "recognize" the Republican county committee, and every man of the thirteen said to himself through closed teeth when he heard the story, "This means war." What form the war should take was settled upon without delay. The war cry is to be: "No more reform till we get some offices!" The plan of war is for Mr. Platt to go in person to Albany and take charge of the Legislature. Every bill which embodies reform for New York city is to be "held up," and its passage refused, till the mayor consents to give some offices to the Platt men.

Nothing is more remarkable among the crowds who surround Mayor Strong in the city hall every day than their simplicity. They are evidently largely from the country, are much more respectable in appearance than the old Tammany gang, and are all in dead earnest. But the mayor's promise of non-partisanship has evidently made no impression on them. They rely as much as ever on good Republican work and fidelity, and believe he will recognize all such claims. But what is oddest in their beliefs is the notion that the mayor gives offices to people he knows nothing about, without much inquiry or consideration, on applications made in this way in the chair at his side. They suppose that if they can see him with a good introduction, they will probably get something that has not been promised to any one else. No better illustration of the way the spoils system has worked into the popular mind could be given than the scene in his room on the receipt of the power-of-removal bill. The attraction of a public place even on a small salary is evidently very great. Why it is so great would furnish an interesting topic for sociological speculation.

The Harvard faculty have followed President Eliot's lead in voting that intercollegiate football ought to be abolished. This action will be communicated to the athletic committee, a university body in its composition, and may or may not be given effect by them. Three out of the nine members being undergraduates, it would seem as if a majority in favor of the existing custom were more probable than the reverse. In that case, we shall be likely to witness another futile attempt to "reform" the game. There is, however, a strong disposition on the part of football-players of distinction at Harvard to confine the game to college grounds, with only college people for spectators; and this would be a decided gain on the moral side. Nevertheless, we adhere to our oft-repeated conviction that the simple solution of the whole athletic problem lies in concentrating the interest of each college upon home sports, without regard to, or competition or contact with, any other college. We do not separate football from other team play when we condemn all intercollegiate contests as demoralizing, and as tending to substitute physical for spiritual ideals in the aim and intent of college discipline. Football is simply more brutal and more perilous.

The announcement that the Yale "*Lit.*" prize would not be awarded this year because not one of the essays handed in was worthy of such recognition, must give something of a shock to the older graduates of that institution, coming, too, so soon after the comments made on Yale's uninterrupted defeats in the debating contests with Harvard. In the early sixties, a freshman on entering Yale had pointed out to him as the college heroes the great debaters of the two old open societies. To-day even those societies are dead, and the freshman has pointed out to him the champion slugger at football, the highest jumper, and the furthest thrower of the hammer. Even the champion oarsman takes a second place in these days of higher athletics. Friends of the college who protest against this state of things, however, are "jumped on."

An English paper lately published what it called an "Ambassadorial Number," consisting largely of interviews with the diplomats residing near the Court of St. James's. The theme upon which their views were solicited was international peace. Diverse opinions were discovered as to its possibility and its foundations. Mr. Bayard spoke at some length upon the many reasons why the closest friendship should exist between his country and England, and thought commerce afforded the best and firmest basis for peaceful international relations. This shows what antiquated and absurd ideas our minister to England is still afflicted with. True, he agrees with the fathers of the republic and the framers of the Constitution, he has the same idyllic notions as Franklin and Paine and Jefferson and Hamilton; but it is pitiful to find him unaware how we have changed all that. One Senate debate, one lecture before a "war college," one editorial in a really great newspaper, would have been enough to inform him that, in the modern world, commerce is the greatest and direst promoter of war. Every cargo of foreign goods landed here is little better than an insult, while buying wheat or mutton of Argentina is practically tantamount to a declaration of war. Has Mr. Bayard never heard of the impending great war and its cause? Doesn't he know that our foreign commerce is going to provoke England to such insensate fury that she will begin firing on our merchantmen, and that, therefore, we, on our part, must have some big ships ready and begin firing on her merchantmen first? All our schoolboys know these elementary truths of statecraft, and it is depressing to find Mr. Bayard ignorant of them. The Brazilian minister showed to great advantage, compared with him, by roundly saying of international peace that it was "a myth." The Chinese ambassador seemed to agree with the American, that peace is to the mutual benefit of nations; but *his* reasons for praising peace are a little too obvious just now.

MR. SHERMAN'S BLACK CONTRACTS.

SENATOR LODGE proved again, on Saturday, the easy superiority of an educated man over blatherskites in their own specialty. After the mining-camp Senators had poured out their vituperation on the President for saving the public credit, the cultured son of Harvard distanced them all by saying of the bond-contract: "It is on its face the blackest public contract ever made by the Government of the United States." On Monday the cry was taken up by Senator Sherman. He left the blackness and the blackguardism to Lodge, and contented himself with calling the contract "faulty and improvident." This suggests an inquiry as to the nature of the contracts which he himself made as secretary of the treasury. What were they and what was said of them at the time?

The details are all set forth in the volume published by the Government in 1880 on 'Specie Resumption and Refunding of the National Debt.' One has only to read it to discover that essentially the same difficulties confronted the Treasury then as embarrass it now, and that essentially the same measures were chosen to surmount them. The arguments that make out Carlisle's contract black, make out Sherman's blacker.

The first argument which Lodge and his fellows use is, that the Treasury has put itself in the power of foreigners. The Jews have us on the hip. But then what are the names of the "parties of the second part" in the contracts made by Secretary Morrill in 1876 and Secretary Sherman in 1877 and 1878? Why, they are the dreadful names at the sound of which every true American starts in horror, unless he is in a position where he must get a loan—the names of Rothschild, Seligman, Raphael, Kuhn, Loeb, Hoffmann, and others as ominous. On April 12, 1878, the following cable message was received at the Treasury in Washington, than which, as the orators say, nothing more damning ever appeared in a Government publication:

> "Very pleased we have entered into relations again with American Government. Shall do our best to make the business successful.
> "ROTHSCHILDS."

What a splitting of throats and cracking of ear-drums there would be over such a message now—the Jew firm gloating over a victimized secretary!

The second argument to show the exceeding blackness of the Carlisle contract is the fact that it gives the syndicate an option on all bonds that may be issued up to next October. If this makes the Carlisle contract black, it makes the Morrill and Sherman contracts blacker. Those documents gave the wicked foreign syndicate not an option, but an "exclusive right" to subscribe for further bonds. As a matter of fact, on two occasions Mr. Sherman had offers for several millions of bonds at better figures than the syndicate would give. He was obliged to decline them on the ground that the syndicate had a monopoly. This makes a mere option look positively white.

Finally, say or shriek the blatherskites, the syndicate is going to make an enormous amount of money. This is what worries Mr. Sherman. Selling a bond at 104 which may soon be placed at 118 or 120 is too much for him. Senator Gray forcibly retorts that the great Ohio trimmer really makes the favorable situation created by the prompt action of the Treasury the ground for condemning it. If the action had not been taken, no bonds could have been sold at any price. The nation was only three days away from bankruptcy. Owing to that emergency, and by surmounting it, the bankers were able to make a profit out of their investment. This is a sufficient answer on general principles. But a better answer to Senator Sherman is of the *tu quoque* sort. If it is "faulty and improvident" to sell a 4 bond at 104, with the prospect of seeing it quoted at 118, what is it to sell a 4 per cent. bond at 100, only to have it quoted in a few years at 126?

Senator Sherman dwells in an even more fragile glass house than this. He admits that the motives and the character of Secretary Carlisle are beyond suspicion. Was the same said of him in 1877–'79? Has he forgotten the ugly talk in those years about "Fort Sherman"? Has he no memory for congressional inquiries, for demands for a list of commissions paid (and they mounted up into the millions), for the complaints about double interest allowed favored banks, and, in particular, for the charge that he had practically handed over a clean $1,000,000 of profits to a single bank in this city? Has he no recollection of the talk of indicting or impeaching him? In an interview in the *Tribune* of December 25, 1878, Mr. Sherman admitted that the banks had made huge profits out of the exercise of his discretion in making them refunding agents. Is he the man to lead off in railing accusations against his successor in office? It is safe to say that no charges of personal dishonesty will be made against Secretary Carlisle in the New York Republican platform of 1895, such as were made against Senator Sherman, by implication, in the New York Democratic platform of 1879.

For our part, we never credited those charges for an instant. We saw in Senator Sherman's resumption and refunding operations a great service to the country performed with great skill and in the face of great difficulties. But those operations were substantially similar to the one just closed by the present Administration. The Treasury was in urgent need of gold, and had then as now to turn to the men who had it. The gold had to be taken then as now on the terms of the men who were asked to part with it, not on the terms of the men who were in desperate straits for lack of it. Then as now contracts had to be made which were onerous, which yielded a good profit to the bankers, but which also resulted in great savings to the Government, and which secured the aid of the financial world in sustaining the good faith of this nation. In 1877 and in 1878 the syndicate undertook to control the rates of sterling exchange just as they do now.

In all this we see nothing but what is proper and patriotic. Nor is it surprising that the wolves should open in full cry on the contract of 1895 just as they did on those of 1877 and 1878. But the thing that is surprising, that is outrageous and intolerable, is to find this particular old gray wolf now leading the pack. Blackguardism must needs come, and blatherskites there will always be; but to see the blackguarded of 1878 turn blackguards in 1895, to find Lodge, Sherman, and the *Tribune* among the blatherskites—these things cannot overcome us without our special wonder.

A NEW SILVER CONFERENCE.

IT is the common belief of those who are not making as much money as they have made at some time heretofore, that the trouble is in the currency, and that if the money question could be overhauled and rearranged, good times would return. The half-truths of the silverites on this subject are very specious. They tell us that one-half of the money in the world has been struck out of existence since 1873, and that the great decline in prices must be due to that circumstance. It is assumed without argument that a resolution passed by an international monetary conference would restore the other half and put prices up again; that an advance of prices would be a good thing for the human race; and that it is possible to get an international agreement of this kind, although three attempts have been made and have failed.

During recent years there has been a great deal of unrest in Germany, especially in the Agrarian party (the land-owning class), in consequence of the decline in the prices of wheat and rye. The decline has been really due to very large crops produced in the United States, Russia, and Argentina, and to the commercial treaties with Germany's eastern and southern neighbors which have admitted their cereals at reduced rates of duty. But the silverites ignore all these things, and tell the exasperated land-owners that it is all due to the demonetization of silver. The Government, which has incurred savage hostility by reason of the relaxation of tariffs against Russia and Austria, is not sorry to see the blame shifted to some other quarter for a while. For this reason it fell in with the proposal of the Agrarians last year to have a commission to make a fresh inquiry into the silver question. When a government is in trouble on the bread-and-butter conditions of life, a commission is always in order. It takes time, it gives

a chance for some new excitement to swamp the old one, and it lets off superfluous steam.

The silver commission of last year made a report which was not satisfactory to the Agrarians, and they have now made a push for a new international silver conference. As this will fill up the time for a year or two, and give a chance for something else to happen, the Government does not oppose it, and even favors it in a guarded way. Accordingly the Reichstag votes for it by a large majority. The Socialists, the Catholics, and the small remnant of the German Liberals oppose the movement because they consider it a "false scent," but they are not sufficiently numerous to stop it. So we may assume that the fourth silver conference is in prospect. At all events, it is in shape to be talked about. A few words on the subject of the previous ones are therefore in order.

The first was called at the instance of the United States, and met at Paris August 16, 1878. All the great Powers of Europe except Germany, and most of the lesser ones, took part in it. The conference remained in session till August 29. On the day before the adjournment the European delegates, except those of Italy, joined in a collective answer to the propositions of the United States saying: (1) that it is necessary to maintain in the world the monetary function of silver as well as of gold, but that the selection of one or the other, or both simultaneously, should be governed by the special situation of each state or group of states; (2) that the question of the restriction of the coinage of silver should be equally left to the discretion of each state or group of states; (3) that the differences of opinion which have appeared exclude the discussion of the adoption of a common ratio between the two metals. The representatives of the United States dissented from these conclusions. Thereupon the conference adjourned *sine die*.

The second conference was held at the instance of France and the United States. It met in Paris, April 19, 1881. In this conference Germany and British India participated, in addition to the countries represented in that of 1878. It remained in session till July 8, having taken one intermission from May 19 to June 30. No conclusion was reached and no vote was taken on the main question. The conference adjourned to April 12, 1882, but never reassembled.

The third conference assembled at the instance of the President (not of the Congress) of the United States, at the city of Brussels, November 22, 1892. The same powers were represented as before, with Turkey, Rumania, and Mexico added. It remained in session till December 17, when it adjourned, without taking any action, to May 30, 1893, but did not reassemble at that date or at any other time. In this it followed the valuable precedent of the conference of 1881.

Of course, if there is to be another conference, we shall take part in it, but we hope that President Cleveland will not join in calling it. We have taken the initiative in three conferences, and have been punished by seeing them dissolve in vapor and "pass noiseless out of sight." Now let some other country take the head of the class, or stand on the dunce-block, as the case may be. There is no reason to suppose that a new conference would result differently from the three that have gone before; but if the Powers of Europe want to take silver into their currencies again, we shall be very glad to supply them with all they need.

WEBSTER AND THE WAR SPIRIT.

Of all the addresses made in Congress at the recent presentation of Webster's statue, none was more effective, oratorically, than that of Representative Everett. If the note of eulogy was too unqualified, this might be forgiven one who spoke, as he admitted he did, "to pay a debt of hereditary gratitude." What he said of Webster's services in the peaceful settlement of international difficulties was most just and timely, and a tribute to a great man which needs no color from personal friendship. He referred particularly to the dispute over the Maine boundary, when the hotheads were calling for war. "Throughout the country and all along the frontier fiery spirits were eager to rush to arms." Said Mr. Everett:

> "Suppose Mr. Webster had caught up that sentiment; suppose that, when Sir Robert Peel suggested the hope of a compromise line and sent a special envoy, Mr. Webster had refused the proposal; had defied Sir Robert Peel and Lord Ashburton; had appealed to the war spirit of the country from Maine to Louisiana; had launched the yeomanry and chivalry of the Union simultaneously across the St. Croix, the St. Lawrence, the Columbia, and the Sabine; had sent the *Princeton* on her first cruise to open against the English that deep-mouthed ordnance which was to prove so fatal to his own successor. Why, at the end of Mr. Tyler's administration, he might have floated into the White House, triumphantly borne on waves of blood, as the great war secretary! A more brilliant prospect of glory rarely offers itself to Republican statesmen. Mr. Webster knew better. He knew that the torch of war as it sweeps over kindred nations, however it may dazzle or may warm at the moment, leaves behind it a terrible train of woe. Not merely the wounds and deaths of thousands who can ill be spared to their country; not merely blasted fields and ruined families; not merely the cost of millions, which a peace of tenfold duration can hardly repair, but the rankling passions and unsatiated vengeance of mighty nations, which God made to live together in unity, peace, and concord."

Webster negotiated a treaty and accepted a boundary line which brought upon him the denunciations of all that was ignorant and base in the land. His successors in the State Department have heard the like. With it he obtained the first extradition treaty, and gained the force of precedent for methods of peace, which has been an incalculable blessing to our country.

This was all the greater a service and triumph from the fact that Webster himself had a little of the Jingo in him. His famous letter to Austria, in the Hülsemann case, had a good deal of the Philistine snort about it. He reminded Francis Joseph that the possessions of the house of Hapsburg were "but as a patch on the earth's surface" compared to the region over which the power of the United States extended. To his friend Ticknor he privately confessed that the letter was "boastful and rough," but gave as his excuse that he wanted to "tell the people of Europe who and what we are," and "to write a paper which should touch the national pride and make a man feel sheepish and look silly who should speak of disunion." But in the crisis of the boundary dispute he stood firm for diplomatic adjustment and mutual concessions, despite the craze for war which was sweeping through the States.

Mr. Everett mentioned no contemporary names or tendencies, leaving it to his hearers and readers to make their own comparisons. But there is little doubt that he was moved to his eloquent account of Webster's services to the cause of peace by the reviving and senseless war spirit of our own day. The number of men in private or public life who are now mad to fight somebody is appalling. Navy officers dream of war and talk and lecture about it incessantly. The Senate debates are filled with predictions of impending war and with talk of preparing for it at once. With the country under the necessity of the most stringent economy, appropriations of $12,000,000 for battle-ships are urged upon Congress, not because we need them now, but because we shall need them "in the next great war." Most truculent and bloodthirsty of all, the Jingo editors keep up a din, day after day, about the way we could cripple one country's fleet and destroy another's commerce, and fill the heads of boys and silly men with the idea that war is the normal state of a civilized country.

The only qualification these warriors of the pen make in their praise of war is that it must be defensive. Somebody is to try to get the better of us, or impose upon us, or bully us, and then we are to rise in the majesty of a free people and sup full on horrors. But the curious thing is, that this is precisely what all fighting nations say. Not one of them would think for an instant of an aggressive or unjust war. Not one of them would be guilty of violating a single principle of international law or even courtesy. They are all perfect gentlemen, and it is the other fellow who is going to act like a rowdy and get a good drubbing for it. Now, if they were all honest in these professions, there would be no need of building another man-of-war. If no international aggression is to be committed, or act of injustice done, there will never be a war. As M. Novikoff forcibly points out in his vivacious little book on 'La Guerre et ses Prétendus Bienfaits,' this praise of a purely defensive war and determination to embark in no other is suicidal. If that

were all that was contemplated, modern armaments would be unknown; they are really got together for use in making might equal right. If the aggression of the other party is not forthcoming, it will be imagined, and that will do as well.

But, even for a defensive war, it is as little worth the while of a civilized nation to prepare as it is for a civilized man to prepare to equal at fisticuffs the ruffian who, for all he knows, may tread on his toes or pull his beard in the next street. It is, indeed, significant that all the arguments in favor of war used to be employed in favor of duelling and preparing for the duello. A man must not be helpless when insulted. He must give as good as he got, and learn to be handy with pistol and sword. Everybody knows that such training simply multiplied insults and encounters, and anybody can see that the same effects will follow the habit of preparing for an international duello. The civilized man does not, as Lord Brougham did, step out into the street and fight with a navvy who insults him; he hands the man over to the police. A civilized nation may do the same. International law, peaceful arbitration, the growth of the moral sense in nations, constitute the police to which a quarrelsome and aggressive country may be turned over. They make up a power which no nation can safely defy, and in which a dignified and self-respecting people may as securely trust as may the individual in the protection of the courts.

ELEMENTARY INSTRUCTION.

It is but little more than a year since a committee of ten, with President Eliot of Harvard at their head, submitted to the National Educational Association a report dealing with secondary-school studies, and with the relations which ought to exist between the schools and the colleges. The good effects of that report, and of the study and discussion that it stimulated, are still being felt throughout the country. Perhaps no single educational document has ever excited so much attention, and provoked so much controversy, as that now famous report of the Committee of Ten.

But it covered only a portion of the field of education, and the most pressing problems that grow out of the needs of the vast system of elementary schools remained for separate treatment. These were referred to a second committee, of fifteen members, presided over by Superintendent Maxwell of Brooklyn. This committee was constituted early in 1893, and its report has just been published. The members of the committee were the superintendents of schools in the cities of Brooklyn, Boston, Philadelphia, Chicago, Kansas City, St. Paul, Cleveland (O.), Providence (R. I.), Springfield (Mass.), Peoria, Galveston, and Washington, together with the State superintendent of schools in New Jersey, President Draper of the University of Illinois, and Dr. William T. Harris, the United States commissioner of education. A committee of more experienced and representative men could hardly be found.

This Committee of Fifteen, after two years of investigation and deliberation, has submitted an elaborate report on three topics: the training of teachers, the correlation of studies in elementary education, and the organization of city school systems. This report was laid before the Department of Superintendence of the National Educational Association, in session at Cleveland on February 19–21, and there discussed. It will now take the same course as the report of the Committee of Ten, and become matter of debate among teachers, boards of education, and intelligent citizens in all parts of the country.

On the subject of the training of teachers the committee speaks with no uncertain sound. It is insisted that a high-school education is an essential part of the equipment of an elementary-school teacher, and that a college education is necessary to fit a high-school teacher for his work. On the basis of the scholarship thus gained the strictly professional training must be carried on. This is held to include the study of psychology as a basis for principles and methods, of methodology as a guide to instruction; of school economy, which adjusts the conditions of work; and of the history of education, which gives breadth of view. The training is to include also observation of good teaching, and practice-teaching under supervision and criticism. It may perhaps be objected that all this is a matter of course. It ought to be, but unfortunately it is not. Even in New York city and in Brooklyn hundreds of teachers are given licenses and appointments on the basis of an examination alone, no professional training being necessary. In other and better-governed cities it has become customary for progressive schoolboards to put into their by-laws a provision requiring that all applicants for teachers' licenses must have spent some time in a normal school, city training-school, or pedagogical department of a college. It is hardly conceivable that so clear and logically reasoned a statement as the Committee of Fifteen makes on this point, will not lead to a general improvement throughout the country in this vital matter of professionally trained teachers.

The second part of the report treats of the correlation of studies, and is from the pen of Dr. Harris. While very valuable in many ways, and susceptible of being used to great advantage, it is disappointing in that it almost completely ignores what many teachers believe to be the really important element in correlation. The practical situation in which the elementary school finds itself is this: The rapid and increasingly complex development of the demands of modern life has added largely to the burdens of the school. More must be taught, both in quality and in quantity, than was formerly the case. The time remains as limited as it ever was. The real problem of correlation lies in the possibility of so treating the several school studies that they will become mutually dependent, occupy less time than when treated as independent wholes, and coöperate together to make what the followers of Herbart are fond of calling educative, or character-building, instruction. This point of view is evidently not acceptable to Dr. Harris, but a strong plea is made for it in the dissenting statements of Superintendent Gilbert of St. Paul and Superintendent Jones of Cleveland. The value of this portion of the report consists in its full and careful analysis of the studies of the elementary school and of their respective values as educational instruments. Dr. Harris performs this task with skill and great learning, although assent to all of his propositions is impossible. Six years is ample time for the strictly elementary course, and to insist upon eight years is simply to yield to the influence of a bad but prevailing custom. Written English is more useful and more important than the report admits, and the arguments adduced for postponing the use of the simpler algebraic processes and the study of plane geometry—the *Raumlehre* of the German schools—are in flat contradiction to the actual experience of many of the best teachers. As the discussion of this part of the report proceeds, many other shortcomings and defects, due largely to its point of view, will appear.

The final portion of the report, written by President Andrew S. Draper, may be unreservedly commended. During his six years of service as a State superintendent in New York and two years as city superintendent in Cleveland, Mr. Draper had ample opportunity to perceive the defects of the ordinary school administration in cities. On all questions of principle his views are in full accord with those of the framers of the bill designed to place the school systems of New York and Brooklyn on a proper footing. The report lays down two fundamental principles, which will at once be agreed to. The first is, that there must be complete separation of legislative and executive functions; the second is, that the business administration of the schools must be kept distinct from the educational administration. Full authority and responsibility must be conferred upon the head of each of these departments. The detailed plan that the committee recommends is substantially that adopted in Cleveland, O., in 1892, and now known generally as the "Cleveland plan." Its essential features are a small, unpaid school board, appointed by the mayor without regard to political belief or local political divisions; a commissioner of education, who is at the head of the business department, and who appoints the superintendent; and a superintendent of schools, appointed to serve during good behavior or for a long term, under whose

direct control the educational administration of the schools is put. There is fair ground for a difference of opinion as to that feature of the plan which provides for the appointment of the superintendent of schools by the commissioner of education, and the dissentients from the report —Superintendents Seaver of Boston and Lane of Chicago—will find much support for their position. Notwithstanding this fact, President Draper's discussion of city school systems is clear and exhaustive, and it would be a capital document to put into the hands of mayors, superintendents of schools, members of school boards, and members of the Legislature generally.

The entire report is a scholarly and stimulating treatment of its subjects. Its authors are men of large practical experience in dealing with the problems that it discusses. It may properly take its place by the side of the report of the Committee of Ten; and the two papers together may well increase our respect for the men who are directing the development of education in the United States.

FRENEAU'S *NATIONAL GAZETTE.*

BROOKLYN, February 15, 1895.

ON Monday, October 31, 1791, the first number of the above-named paper was issued in Philadelphia. Even in its earliest issues it began a criticism of certain acts of the executive of the United States, which became more and more bitter and sweeping as time went on. This partisanship merited special notice from the rather striking circumstance that Philip Freneau, the editor of the *Gazette*, was an office-holder under the very Government he was so persistently attacking, having been appointed translating clerk in the Department of State but a few weeks before the commencement of his paper. When to this fact was added the quickly developed circumstance that the paper attacked only the Treasury and War Departments, with some few acts of the President, and had nothing but praise for the department presided over by Jefferson, the inference was clear that the Secretary of State, by his appointment, had, in modern vernacular, "muzzled" this particular paper—if, indeed, he had not deliberately subsidized an editor to attack his fellow-secretaries and the President under whom he served.

This latter view was taken by Hamilton, and as Freneau's attacks rose in crescendo, Hamilton's irritation finally led him, under a pseudonym, to print the following query (*U. S. Gazette*, July 25, 1792):

"The Editor of the *National Gazette* receives a salary from Government:

"Quere—Whether this salary is paid him for *translations;* or for *publications*, the design of which is to vilify those to whom the voice of the people has committed the administration of our public affairs—to oppose the measures of Government, and, by false insinuations, to disturb the public peace?

"In common life it is thought ungrateful for a man to bite the hand that puts bread in his mouth; but if the man is hired to do it, the case is altered. T. L."

Nor was it only Hamilton, and the host of scribblers the above note produced, who took this view of it. Jefferson himself records (Writings, i., 231) of Washington, that—

"He adverted to a piece in Freneau's paper of yesterday, he said he despised all their attacks on him personally, but that there never had been an act of the government, not meaning in the Executive line only, but in any line, which that paper had not abused. . . . He was evidently sore & warm, and I took his intention to be that I should interpose in some way with Freneau; perhaps withdraw his appointment of translating clerk in my office. But I will not do it."

This incident has been the subject of much discussion in the biographies of Jefferson and Hamilton, varying views being taken by their respective partisans. Whether a journalist is not as morally disqualified from salaried public office as a lawyer is from the jury panel, will probably ever be a question of elasticity of conscience rather than of accepted convention. But in this particular case the chief importance turns on the doubt whether Freneau was subsidized with an office to encourage him to start the *Gazette* in order that he might attack what Jefferson disapproved in the course of the Government, or was merely given the office without regard to his opinions or paper, because he could perform its duties satisfactorily. Despite Hamilton's failure at the time to obtain proof of his contention, his partisans have, from obvious inference, maintained the former view. Jefferson himself, in a letter to Washington (September 9, 1792), claimed that the appointment was solely one of merit, and not with expectation that it would lead "to any criticism on the proceedings of Government." This was supported by an affidavit of Freneau, made in consequence of the above anonymous note of Hamilton, and printed at the time (*U. S. Gazette*, August 8, 1792):

"Personally appeared before me, Matthew Clarkson, Mayor of the City of Philadelphia, Philip Freneau, of the City of Philadelphia, who, being duly sworn, doth depose and say, That no negociation was ever opened with him by Thomas Jefferson, Secretary of State, for the establishment or institution of the *National Gazette;* that the deponent's coming to the City of Philadelphia, as publisher of a Newspaper, was at no time urged, advised, or influenced by the above officer, but that it was his own voluntary act; and that the said Gazette, nor the Editor thereof, was ever directed, controuled, or attempted to be influenced, in any manner, either by the Secretary of State, or any of his friends; nor was a line ever, directly or indirectly, written, dictated, or composed for it by that officer, but that the Editor has consulted his own judgment alone in the conducting of it—free—unfettered—and uninfluenced.

"PHILIP FRENEAU.

"Sworn the 6th August, 1792, before
"MATTHEW CLARKSON, Mayor."

This double testimony was so strong as to furnish a satisfactory denial to Hamilton's charge. Yet the situation was so delicate a one at best that both sets of biographers have carefully dodged discussing the ethics involved. Perhaps had a little more attention been paid to the existing evidence, the affair might have been made clear enough to receive more definite treatment.

On February 28, 1791, or a fortnight after the appearance of "the little rift within the lute" in Washington's Cabinet, caused by the disagreement over the Bank Bill, Jefferson wrote Freneau:

"The clerkship for foreign languages in my office is vacant. The salary indeed is very low, being but two hundred & fifty dollars a year. But also it gives so little to do as not to interfere with any other calling the person may chuse, which would not absent him from the seat of government. I was told a few days ago that it might perhaps be convenient to you to accept it. If so, it is at your service. It requires no other qualification than a moderate knowledge of the French. Should anything better turn up within my department, that might suit you, I should be very happy to be able to bestow it as well. Should you conclude to accept the present, you may consider it as engaged to you, only be so good as to drop me a line informing me of your resolution."

This offer, so Jefferson stated, was made at the suggestion of Henry Lee and Madison. Freneau's reply is not extant, but can be gathered from a letter from Madison to Jefferson (May 1, 1791):

"I have seen Freneau also and given him a line to you. He sets out for Philada. today or tomorrow, though it is not improbable that he may halt in N. Jersey. He is in the habit, I find, of translating the Leyden *Gazette* and consequently must be fully equal to the task you have alloted for him. He had supposed that besides this degree of skill, it might be expected that he should be able to translate with equal propriety into French: and under this idea, his delicacy had taken an insuperable objection to the undertaking. Being now set right as to this particular and being made sensible of the advantages of Philada. over N. Jersey for his private undertaking, his mind is taking another turn; and if the scantiness of his capital should not be a bar, I think he will establish himself in the former. At all events he will give his friends there an opportunity of aiding his decision by their information & counsel. The more I learn of his character, talents and principles, the more I should regret his burying himself in the obscurity he had chosen in N. Jersey. It is certain that there is not to be found in the whole catalogue of American Printers, a single name that can approach towards a rivalship."

To this Jefferson replied (May 9, 1791):

"Your favor of the 1st came to hand on the 3d. Mr. Freneau has not followed it. I suppose therefore he has changed his mind back again, for which I am really sorry."

Even more definite as to the project was a letter Jefferson wrote to his son-in-law, Randolph, on May 15, 1791:

"I enclose you Bache's as well as Fenno's papers. You will have perceived that the latter is a paper of pure Toryism, disseminating the doctrines of Monarchy, aristocracy, & the exclusion of the people. We have been trying to get another *weekly* or *half weekly* set up, excluding advertisements, so that it might go through the states & furnish a *whig vehicle* of intelligence. We hoped at one time to have persuaded Freneau to set up here, but failed."

The scheme, however, was not abandoned with this failure, for on July 21, 1791, Jefferson wrote to Madison:

"I am sincerely sorry that Freneau has declined coming here. Tho' the printing business be sufficiently full here, yet I think he would have set out on such advantageous ground as to have been sure of success. His own genius in the first place is so superior to that of his competitors. I should have given him the perusal of all my letters of foreign intelligence & all foreign newspapers; the publication of all proclamations & other public notices within my department, & the printing of the laws, which added to his salary would have been a considerable aid. Besides this, Fenno's being the only weekly, or half weekly paper, & under general condemnation for its toryism & its incessant efforts to overturn the government, Freneau would have found that ground as good as unoccupied."

Thus urged, Freneau reconsidered his refusal, and wrote (July 25, 1791) to Madison:

"Some business detains me here a day or two longer from returning to New York. When I come, which I expect will be on Thursday, if you should not have left the City I will give you a decisive answer relative to printing my paper at the Seat of Govt. instead of in N. York. If I can get Mr. Childs to be connected with me on a tolerable plan, I believe I shall sacrifice other considerations and transfer myself to Philadelphia."

Childs agreeing to join Freneau, the next move is disclosed in the following paper:

"DEPARTMENT OF STATE OF THE UNITED STATES.

"Philip Freneau is hereby appointed Clerk for foreign languages in the office of Secretary of State, with a salary of two hundred &

fifty dollars a year, to commence from the time he shall take the requisite oaths of qualification. Given under my hand and seal this 16th day of August, 1791. "TH. JEFFERSON."

A few weeks later the paper was started. It met with apparent success, till Genet's threat to "appeal" from Washington to the people so enraged the national spirit that it struck at "Republicanism," whether French or American. The *National Gazette* had been too conspicuous to escape from this "tidal wave"; subscriptions were withdrawn, and subscribers refused to pay, to such an extent that its notes went to protest and Freneau was compelled to abandon it, the last issue being made October 13, 1793. How close was the relation between the newspaper and the office is revealed in the following document:

"The within contains the appointment of Philip Freneau to the office of clerkship of Foreign Languages in the department of State—by Mr. Jefferson.

"I hereby resign the same appointment, from October 1st, 1793.

"PHILIP FRENEAU.

"PHILADELPHIA, October 11th, 1793."

On this Jefferson noted "rec'd. Nov. 7." Only a few weeks later he himself likewise retired from office. It was his first experiment in partisan appointments, and had resulted only in bad feeling and untruths, while certain to bring discredit to him later. But he did not learn from it, any more than his successors have done, the danger of party patronage or the folly of a "muzzled press."

PAUL LEICESTER FORD.

MEMOIRS OF THE DIRECTORY—I.

PARIS, January 31, 1895.

THE period of the French Revolution which separates the tragedies of the Terror from the epic years of the Empire is in reality less known to us than many less interesting parts of our history. The Directory loses too much in comparison with what preceded it and what followed. But the student of history who sees a development, an evolution, in the formation of society and the creation of all political institutions, ought, perhaps, to pay special attention to those years of the Directory which marked the transition between the old régime and the new one. The confusion of that period, the mediocrity of the leaders who survived the Robespierres and the Dantons, their meanness and often their infamy, their petty struggles, and, finally, their half-willing and half-forced abdication before a military Dictator who had become the armed representative of the principles of the Revolution—all these traits would form an admirable subject for an expert and profound historian; but the time is not yet come when such a history can be well written, according to the principles of the modern historical school, as many documents concerning that period have not yet come to light.

Not till a week ago have we been able to read the Memoirs of Larévellière-Lépeaux, who was one of the members of the Executive Directory of the French Republic. These memoirs are edited by his son from the autograph manuscript. The Director died on the 27th of March, 1824, having ordered that his manuscripts should not become accessible to anybody before 1873. The only persons who were allowed to take a partial survey of them after 1824 were M. de Lamartine and M. Thiers. Larévellière-Lépeaux had written his memoirs hastily and loosely, and he recommended that they should be revised and completed, with the help of some notes and papers which he left. Unfortunately, some of these notes, which were kept in a country house near Montmorency, disappeared during the first invasion of France, when the house was occupied by Hanoverian troops. Among the documents which were then burned or subtracted were the letters of Gen. Bonaparte to the Director during the campaigns of Italy. Long afterwards, the son of the Director left Paris to live in Anjou, leaving many papers in Paris in a box which was subsequently lost. It is fortunate that the manuscript of the memoirs was more carefully kept. It is not surprising that the Director wished his manuscript to be revised, but it is better that it should not have been, as the reader can easily make a sort of revision in his own mind, and it is always best to have what we call the *premier jet* of a writer. Larévellière speaks very harshly of some of the men with whom he had to associate; in some "Essential Observations on my Memoirs," he carefully advises his future editor to tone down some of his opinions and judgments.

Larévellière-Lépeaux was born on the 24th of August, 1753, at Montaigu, in Poitou. His father was of a family of "bourgeois de campagne," to use his own expression—he might have said of well-to-do peasants. If he had remembered the words of Pascal, "le moi est haïssable," he would have spared us many uninteresting details on his education and his youth. He really becomes interesting only when he becomes a public man. He was elected in Anjou a deputy to the States-General for the Tiers-État. He played no part in the great debates of the Constituent Assembly; he was afterwards appointed deputy of the Convention, and became a witness of and obscure actor in the great struggles of the Girondins and the Jacobins. He had, he says, taken the resolution "to attach himself to no party, to no chief of party, to vote always according to his conscience." He was a member of the Plain, so called in contradistinction to the Mountain. In the trial of Louis XVI. he voted for the death of the King. In a conference which he had during the trial with the members of the Gironde, Vergniaud, Pétion, and others, he made a speech which is found in the memoirs: he said that if the Convention absolved Louis XVI., the municipality of Paris, the sections, the populace, would surely murder the King and his family in the Temple, dissolve the Convention, and proclaim the Commune. "On the other hand, if you vote for condemnation—the only thing that you can do in our unhappy circumstances—your adversaries will not have the faintest pretext for suspecting your patriotism and for becoming popular at your expense; you will preserve such a moral force and such an influence that, with courage and with perseverance, you will break down the detestable projects of the anarchists."

Such arguments will recur in every great political crisis, and they are too often found convincing. The Girondins who sacrificed the King in order to keep the moral force and the popularity Larévellière-Lépeaux speaks of, lost, on the contrary, all their force and their popularity, and became the victims of Danton, who became himself the victim of Robespierre, who, in his turn, became the victim of the men of Thermidor. The Revolution, like Saturn, devoured its children; the survivors were the men of the Plain who were saved by their subserviency to the dominant party, by their silence and their obscurity. Larévellière had at times some glimpses of courage—he dared once or twice to oppose at the tribune the motions of the Jacobins; but, as he says, "a majority, however great it may be, becomes by degrees a small minority when its most important members imprudently become unpopular and allow themselves to be subjugated by a turbulent and tenacious minority." "Every day a concession is made, in the hope that the minority will be grateful to you and will abandon its unjust pretensions—nothing is more fatal than such a calculation"; such words are applicable to all times and to all assemblies.

Larévellière-Lépeaux dared to speak against the creation of the famous revolutionary tribunal. Some of his friends resigned because the decisions of the Convention were always proclaimed officially to have been unanimous, though they had opposed them. "My friends Pilastre and Leclerc resigned so as not to seem to take part in the extravagant and atrocious measures which were adopted every day. . . . As for myself, who was accustomed to speak, I did not think that I ought to resign; I wished to struggle to the end." He could not stay long, however, in the Convention; he was informed that a warrant had been issued against him, and he took flight to a sort of hermitage in the Forest of Montmorency, where Bosc had received already Roland and others. (The Memoirs of Mme. Roland were hidden for a long time in that little hermitage of Sainte-Radegonde.) Bosc and Larévellière had to live there on a little bread, potatoes, and milk. The latter travelled on foot for twelve days, in constant fear of being recognized, from Sainte-Radegonde to the house of M. de Buire, whom he had known in the States-General, near Péronne. He there learned the news of the arrest of Robespierre and of his execution, and returned to Paris. The party which was afterwards called the party of Thermidor, had at its head Tallien, Barras, Fouché, Fréron, Legendre. It was formed of the remains of the party of the Duc d'Orléans and of the party of Danton, and some of its members were secretly allied with the royalists and with the agents of the princes in exile. Cambacérès and Boissy d'Anglas had joined it.

It would be tedious to dwell on the divisions of the Assembly which was preparing the constitution that goes under the name of the Constitution of the Year iii. Larévellière was one of the members of the committee of eleven which framed this constitution. Except Daunou, Lanjuinais, and Boissy d'Anglas, all the other members are now absolutely forgotten. The executive power was confided to a committee or directory of five members, elected by two Legislative Councils—the Council of the Ancients and the Council of the Five Hundred. The Committee of Public Safety was still in existence, and Larévellière was appointed a member of it along with Daunou. But the Convention and the famous committee were no longer what they had been.

"The Convention was no longer the assembly of which the chiefs of factions, with the help of the execrable arms of the Terror, had made a unit with a terrible activity. It was now a mob without consistence, a mass without adhesion, formed of the incoherent remains of all the parties which had in succession destroyed each other. The state of the Convention was the faithful image of the state of France. The Committee of Public Safety, the real heart of the state, the only centre to which everything could have been attached, which could give movement to all, had fallen into complete dissolution."

Cambacérès was president of the committee. When he arrived at ten o'clock in the morning, his first care was to order a good *pot-au-feu*, and to have on the table excellent bread and wine—two things which could hardly be

found anywhere at the time but there. The other members arrived. "'President, is there anything new?' 'Why, no,' was generally the answer. The newcomers approached the *pot-au-feu*, took a bouillon, helped themselves to a slice of the beef, which they ate with good white bread and excellent Burgundy, *tarde venientibus ossa*." The chief preoccupation was the question of food and the question of paper money. The whole night was spent in printing the assignats which were necessary for the next day. Sometimes a deputation of women came asking for bread. There was a deputy, named Roux, who had the specialty of receiving them. His bureau was in the attic of the Tuileries; the way to it was a very long, narrow and steep staircase.

"When the head of the column arrived at the top, Roux went out of his office, asked them to stop and be silent, and, whether they were so or not, from this tribune he began a speech the duration of which was three, four, six hours or more, if necessary, according to the obstinacy of the petitioners. Interruptions, clamor, threats, nothing could stop this torrent of eloquence, full of all the commonplaces which everybody repeated in those times. At last, exhausted and overfed with vain words instead of bread, these unfortunate women marched off one by one, and when they were reduced to a small number, Roux took leave of them, recommending them to carry peace and hope to their families. . . . On a certain day in Germinal he perorated before a numberless multitude from eight or nine o'clock in the morning till towards five or six o'clock at night. He several times saved the Convention in this way from rather serious insurrections."

The conversations between Roux and Cambacérès are very amusing; they always ended in the preparation of a good repast for Cambacérès and the committees; the suppers often lasted till three or four o'clock in the morning. "Daunou and I," says the virtuous Larévellière, "have not to reproach ourselves with having ever taken a part in these sacrilegious repasts, either in the morning or in the evening." He is indignant at the "insane joy, the scandalous *bombance*, of the members of the committees, but is willing to admit that some relaxation was sure to follow the ferocity of the Terrorist Committee of Public Safety.

The Convention died its natural death on the 4th Brumaire Year iv, and the Constitution of the Year iii went into operation by a rearrangement of the Deputies in two chambers—the Five Hundred and the Ancients. The two councils elected the first Directory, composed of Larévellière, Rewbell, Barras, Letourneur, and Sieyès, who refused the nomination.

"On the 11th Brumaire, at ten o'clock in the morning, Rewbell, Barras, Letourneur, and myself went to the place of meeting of the Committee of Public Safety. We took there some writing-paper, an inkstand, a knife, and a few pens; then we went all four to the Petit Luxembourg [a house annexed to the Luxembourg, now inhabited by the President of the Senate], in the same carriage, surrounded, according to the terms of the Constitution, with a guard of 140 men on foot and 140 men on horseback. The dragoons who formed this escort had bad shoes, or stockings in rags instead of shoes. We found all the apartments absolutely bare—not a piece of furniture. The porter gave us a small table and four chairs which belonged to him. He made us also a present of a little wood, as the weather was very cold."

In this empty room and on this miserable table was written the act announcing to France that the Directory had entered upon its executive functions. The next day, Carnot, who had been elected in place of Sieyès, came and added his signature to the solemn document.

Correspondence.

A DOUBLE MOTIVE.

To the Editor of The Nation:

Sir: It was a very significant vote, 165 to 120, by which the House of Representatives on Thursday defeated Mr. Cleveland's alternative of a 3 per cent. gold bond at par, though it is characteristically described as Mr. Wilson's gold-bond resolution. It is safe to say that hostility to any initiative by the President was a stronger incentive than any feeling about silver. It is amusing also to see the frantic efforts of members and of Republicans outside of Congress to divert public wrath by reviling the President for making a bad bargain—in short to

> "Compound for sins they are inclined to
> By damning those they have no mind to."

But the wind is completely taken out of their sails by the fact that, if they did not like the bargain, it was in their power, by a resolution of the simplest honesty, to convert it into a different bargain, as good as is commanded by any government in the world.

There is a charming simplicity, again, in the pretext that if these bonds were made payable in gold it would throw doubt upon the older ones, which are not; as if those bonds were not issued when there was no disparity between silver and gold, or as if the resolution could not state that, while expressed in the new bonds, it shall be regarded as implied in the old ones.

Far more important than any question of silver or of currency is that of the relation of the executive to the legislature: whether this country is to be governed by the discordant struggles of private and party intrigue in Congress, or by the steadying power of responsible executive government, subject to the approval or disapproval of Congress after full public debate, bringing out motives and character in a white light before public opinion.

Mr. Cleveland has done already magnificent service in this direction, and the whole currency complication will prove to be a blessing instead of a curse if it shall force to the front this most momentous of all issues. The next step which the President might take is to announce that the Secretary of the Treasury will appear before no more committees either of the House or the Senate. Henceforth, if the legislature wishes information from the executive branch, it can have it through an authorized agent in public session of either house, but it cannot summon the chief officers of the Government like an ordinary witness before a factional committee, and then, after cross-examination, transmute his evidence into something which it may suit the legislature to consider and vote upon without any intervention of those who are responsible for carrying on the government of the country. G. B.

Boston, February 16, 1895.

WASHINGTON AND BRADDOCK'S FIELD.

To the Editor of The Nation:

Sir: Mr. Moncure D. Conway, in his article in the *Nation* of February 14, 1895, headed "Washington's Purchase of Braddock's Field," exhibits an amazing lack of information. He evidently believes that the Great Meadows, in which Fort Necessity was situated, was the scene of Braddock's disastrous defeat, when in fact the Great Meadows is in what is now Fayette County, Pa., and Braddock's Field is in Alleghany County, Pa. I do not at this moment recollect the exact distance between them, but Braddock's army passed the Great Meadows June 25, and reached the ground where he was defeated July 9, 1755. He was defeated on the right bank of the Monongahela River, just below the mouth of Turtle Creek, not far from the present city of Pittsburgh.

Of course every one familiar with the life of Washington is aware that he owned the "Great Meadows." Isaac Craig.

Alleghany, February 16, 1895.

THE GEOFFROY SAINT HILAIRES AND BORY DE SAINT-VINCENT.

To the Editor of The Nation:

Sir: In neither of the appreciative notices of the "Columbia University Biological Series" published in recent numbers of the *Nation* (February 7 and 14) has rectification been made of faults in names of several authors. As future editions of the excellent works in question may be demanded, I take the liberty of calling attention to them.

Extended notices are given by Prof. Osborn of the Geoffroy Saint-Hilaires, but the professor evidently believed that the elder (Étienne Geoffroy St.-Hilaire) had Geoffroy as a Christian name, and that the younger was called Isidore St.-Hilaire. The fact is, that both had as the family name Geoffroy St.-Hilaire, and both were called Geoffroy in familiar intercourse and even sometimes in formal memoirs. Both were called Geoffroy only, in passages in early works by Cuvier and other friends; and in the obituary eulogy by Quatrefages of the younger man, after the introduction, the subject is simply called M. Geoffroy or M. Isidore Geoffroy. In all bibliographies of repute the works of both men are catalogued under the name of Geoffroy St.-Hilaire. The original family name was simply Geoffroy, and Quatrefages says: "Une des branches de la famille *Geoffroy* a donné trois membres à l'Académie des Sciences dans le xviii^e^ siècle." If it is undesirable to give the full name, Geoffroy should be used and never alone St.-Hilaire, which is the name of another distinguished family.

The Baron Bory de St.-Vincent is likewise designated only under the tail end of the name (St.-Vincent) by Prof. Osborn at the page where his views are outlined (p. 205) at the head of the page, as well as in the introduction (p.11), the retrospect (p. 249), and the index (p. 258), although in his quotation from Quatrefages's "Sketch of his Views," he is correctly named Bory. If a short form is needed, Bory is sufficient, and was used by the French author himself, but St.-Vincent should never be used alone. Bory's full name was Jean-Baptiste Georges Marie Bory de Saint-Vincent.

Theo. Gill.

Smithsonian Institution, February 15, 1895.

Notes.

D. Appleton & Co. will issue this month 'Evolution and Effort,' by Edmond Kelly, and 'The Story of the Stars,' by G. F. Chambers, first of a series of "little books dealing with various branches of knowledge."

'Birdcraft,' by Mabel Osgood Wright, to be published by Macmillan, will be distinguished from similar works by plates of birds in their

natural colors. The same firm has in preparation 'Æsthetic Principles,' by Henry Rutgers Marshall, and a volume of selections from Thoreau's Writings, by Henry S. Salt, his biographer.

West India sketches, under the title 'Gossip of the Caribbees,' will shortly be brought out by T. Fisher Unwin, London.

The proceedings at the Bryant centennial celebration in Cummington, Mass., last August, have been printed in an unpretentious volume of eighty pages, with a hitherto unpublished portrait of the poet for a frontispiece, and several local views. The book may be had of the Bryant Memorial Committee, Cummington, for $1 and $1.50, checks being made payable to Lorenzo H. Tower.

We need scarcely recur to the contents of the bound volumes of *Harper's Monthly* for 1894 (vols. 88, 89). *Harper's Weekly* for the same period (vol. 38) possesses its customary value as a pictorial mirror of the time. The Brazilian war, the war over Korea, the civil war known as the Chicago strike, the war against Tammany, the Tillman dispensary war in South Carolina, the campaign of Coxey's Army of the Commonweal, the Bluefields tempest in a teapot—these are some of the salient features of a disturbed year liberally illustrated with scenes and portraits. The illustrious dead are duly commemorated, and number Kossuth, Carnot, and Alexander III., Rubinstein, Helmholtz, Froude, and Holmes. The series of Congressional crayon portraits is continued, not often as unsuccessfully as in the case of Senator Lodge. But most worthy to be mentioned are the portraits of the leaders of the mushroom A. P. A., and of the chief English, French, and German Socialists. These will repay study. Decidedly the most interesting thing in this line in *Harper's Bazar* for 1894 (vol. 27) is the set of four portraits of two of the three female Assemblymen of Colorado, and the female State Superintendents of Public Instruction in that State and in Wyoming. These ladies are all very respectfully treated in biographical sketches which do not suggest the *Bazar's* opposition to woman suffrage. Otherwise, except for a portrait group of Mrs. Cleveland and the wives of Cabinet officers, politics is inconspicuous in the columns of the *Bazar*. Two serial stories, 'Highland Cousins,' by William Black, and Walter Besant's 'Beyond the Dreams of Avarice,' run through the volume, and here also ends the late Theodore Child's discourse on coiffures, 'Wimples and Crisping-pins,' since become a book. The book-notices are all but exclusively of novels or housekeeping works, and the exceptions are made by no apparent rule. The negro has pretty nearly disappeared from the humorous page of the *Bazar*, where he reigned supreme for many years.

"Made to sell" must be the verdict on 'Great Men and Famous Women: A Series of Pen and Pencil Sketches,' edited by Chas. F. Horne (New York: Selmar Hess). The first two volumes, of soldiers and sailors, are a hodge-podge which brings between two covers Frederick the Great, Bonaparte, Francis Marion, and Tecumseh. The sketches are partly borrowed from well-known English or Continental sources, partly written to order on this side of the water, where "Oliver Optic" seems a natural selection for the biographer of Grant, and Mrs. Amelia E. Barr of Sam Houston, who, she says, "on the roll of Fame, shines forth the noblest, the most princely, the most picturesque and chivalrous character in American history." The medley of illustrations is on a par with the letterpress. There are to be six more volumes like these.

The 41st volume of the 'Dictionary of National Biography' (Macmillan) ends with O'Dugan. The tract of names embraced is noticeably barren of literary distinction. In politics we meet with Lord North, Daniel O'Connell, who occupies 28 pages, Smith O'Brien, Feargus O'Connor, and Sir Stafford Northcote, who, we are told, "as a financier, deserves high credit . . . for his acknowledgment of the fact that the income-tax had ceased to be a temporary impost"—an acknowledgment which our own political financiers of another generation may have to make, more or less cheerfully. American interest in this volume attaches not only to Lord North, but also to Nowell and Oakes, early New England worthies, and to the naturalist Nuttall. So recent a celebrity as the late Miss Marianne North has been caught by the editor in passing.

'On the Art of Writing Fiction' is the alluring title of a series of papers recently reprinted from a British magazine (London: Wells, Gardner, Darton & Co.; New York: Charles Scribner's Sons). It is in a way a supplement to Mr. James Payn's suggestion, ten years ago, that novel-writing was a trade anybody could learn—a suggestion which was perhaps the "exciting cause" of Mr. Walter Besant's very practical lecture on the "Art of Fiction." There are eleven papers in the present volume, all by British story-tellers more or less known; and the advice they give is obviously intended for the British novice. The author of 'Mlle. Ixe,' for example, discusses the short story from the point of view of the British magazine, and without a single reference to Daudet or Maupassant, Miss Wilkins or Miss Jewett, and without any real understanding of the essential quality of the short story as distinguished on the one hand from the novel, and on the other from the character-sketch. Equally empty are the papers by Mrs. Parr and Mrs. Macquoid. Perhaps the one paper from which a beginner might benefit is the carelessly written chapter on "The Novel of Manners," by Mrs. Walford.

'The Making of the Body,' by Mrs. S. A. Barnett (Longmans), is an Anatomy and Physiology designed for children. The labored rendering of technicalities, and the very inconsequential stories introduced as explanations, would appear likely to bewilder instead of enlighten an ordinary child. If it is necessary to discuss the brain-membranes in such a book, why substitute for the common names such barbarisms as "The Hard Mother Covering," "The Spider-Web Covering," "The Pious Mother Covering"? Or, to illustrate the action of the nervous system, why introduce such rubbish as "The other day a young American girl said that when she first came to England she put her hands on the bars of the fire [*sic*], not knowing that they were hot enough to burn her, for in America they only use closed stoves"? Dr. Ernest Hart, who ought to know, in an introductory note speaks of this text-book as "delightful" and as "a fairy-tale which is true"; that it is "imaginative in diction [as it most surely is] and accurate in fact." If English school-children have the scientific use of the imagination cultivated in this fashion as a rule, we can well appreciate the astonishing grasp of the ridiculous that the adult mind sometimes displays.

We have received from George Parker Winship, Assistant in American History in Harvard College, a "List of Titles of Documents relating to America contained in Volumes i.-cx. of the *Colección de Documentos Inéditos para la Historia de España*," reprinted from the Bulletin of the Public Library of the City of Boston for October, 1894. Of the value of this little publication, or of the labor involved in its preparation, it is unnecessary to speak. Students of Spanish-American history, however, understand and appreciate it, and they will not be slow in acknowledging their obligations to Mr. Winship for simplifying a task in which the search for facts has, hitherto, been not unlike the proverbial "hunt for a needle in a haystack." That "a similar list of all the documents in this" and, we may add, in all "other Spanish collections is much to be desired" is true; and we doubt if American investigators will rest content until their wishes in this respect are gratified. In the meantime we can only hope that some one as well qualified as Mr. Winship, and with the requisite amount of time and enthusiasm, may be found to undertake the work.

Excepting the genus *Thomomys*, "North American Fauna, No. 8," by Dr. C. Hart Merriam, published by the United States Department of Agriculture, is a monographic revision of those destructive little rodents the "Pocket-Gophers" or "Pouched Rats," the *Geomyidæ*. The work is especially valuable to students of the mammalia. It forms a volume of two hundred and twenty pages, with nineteen plates, and numerous figures in the text, of skeletal details, and three plates of maps showing the distribution. Eight genera are recognized, seven of them being new; thirty-one species, sixteen being new; and five new sub-species. The map locates *Geomys* in southern Georgia and Alabama, in Florida, and in the States west of the Mississippi to the mountains, where it gives way to *Thomomys*, which extends to the Pacific, into British America, and into Mexico. The new genera are Mexican and Central American; one of them, *Cratogeomys*, ranges through New Mexico and Texas to Colorado.

Prof. Ludwig Schlesinger's 'Handbuch der Theorie der Linearen Differentialgleichungen' (Leipzig: B. G. Teubner) is a compilation based entirely upon the works of Fuchs and of the Fuchsians, Thomé, Poincaré, Frobenius, etc. Though without pretensions to originality, it is a work with which a mathematician cannot dispense. Herr Paul Günther, how related to Dr. Siegmund Günther we know not, is said to have collaborated upon certain chapters, especially, as might have been guessed, upon those that are historical. The second volume has yet to appear.

The twenty-eighth edition of the newspaper catalogue published by Rudolf Mosse's advertising agency in Hamburg, has recently appeared in an enlarged form. The different publications are arranged in classes according to subjects; in many cases the circulation is given, together with photographic reproductions in reduced form of a number of papers. The hints to advertisers are of special interest to American readers as showing the European practice in such matters.

That excellent British quarterly, the *Illustrated Archæologist*, has been amalgamated with a kindred publication, and begins the current year under the new designation of the *Reliquary and Illustrated Archæologist*, under the editorship of J. Romilly Allen, F.S.A. Scot. (London: Bemrose & Sons, 23 Old Bailey, E. C.). In the January number nothing is more interesting than the views of human and animal remains and personal belongings of the dead found in some Hunnish graves recently discovered at Cziko, near Buda-Pesth. Among the articles were styles like those used by the

Romans for their wax tablets—one in silver in a woman's hand.

In the *Tribuna* of Rome for January 28 we find a somewhat incoherent report of Dr. B. Amante's search for the tomb of Vittoria Colonna. Her remains have been positively identified in the same sepulchre with her husband's in a church at Naples.

The *Annales de Géographie* for January contains an interesting account of the earthquake at Constantinople, July 10, 1894, by D. Eginitis of Athens. In many places of the epicentre, or centre of disturbance, it was noticed that the swallows some minutes before the shock deserted their nests and flew, some high into the air, where they remained till the shocks had ceased; others took refuge in great numbers on the telegraph-wires. A submarine cable was cut, as by a knife, in many places, "probably from the fall of rocks." From the records of the different European seismometers, it appears that the earthquake-wave travelled at the average rate of a little over three kilometres a second. The direction of the epicentral axis makes it probable that it was not due to volcanic action, but that it was a phenomenon "de nature *tectonique*." Saint-Sophia fortunately escaped with only a few slight injuries to the decorations of the cupolas. The ancient Byzantine fortifications also remain nearly intact. M. A. L. d'Albéca discusses the future of Dahomey, which he paints in bright colors. He believes that all the trade of the Hinterland, as far as the Niger, will eventually fall into the hands of the French, now that the war has been brought to a close. The commerce at the French ports has more than doubled since 1890, and now amounts to nearly five million dollars annually. This is almost wholly the product of the oil-palm. Each tree is the property of an individual, the land being owned by the community, and even in the jungles every one knows his own tree and respects the property of the others. The income from a single tree is a little over two dollars a year.

The *Geographical Journal* for February opens with the description of the physical features of Kolgueff Island, in the Arctic Ocean, by Mr. A. Trevor-Battye, in the course of which he casually says that "on one occasion we caught at one haul of the net 3,300 brent-geese." J. v. Payer, in an animated account of the beauties of arctic scenery, tells of his projected artistic expedition to the east coast of Greenland. He proposes to start in June, 1896, and to take with him two landscape-painters, one animal-painter, and a photographer. Dr. D. Kerr-Cross describes an excursion into the mountainous region to the north of Lake Nyasa, inhabited by a tribe with finer villages and better-built houses than are to be found in any part of uncivilized Africa. The people are industrious, cultivating the ground so carefully with giant hoes that the "fields look as if they had been deeply ploughed, and every furrow is perfectly straight." Slavery is unknown among them, and "woman is accorded a very high place." Pure science is represented in the paper by Prof. W. M. Davis of Harvard University on the "Development of Certain English Rivers." The progress of the Siberian railway is described by P. Kropotkin, and there is a very interesting letter from Mrs. Bishop giving the latest incidents of her adventurous journey in the far East. In the course of it she says: "Korea is the most uninteresting country I have travelled in. The people seem the dregs of a race." During her river voyage to Mukden she encountered a five days' storm of incessant rain, which "turned the magnificent plain of Mantchuria into a malarious inland sea" eight feet deep. "I saw the destruction of over thirty prosperous villages, and had the happiness of saving some lives." In a postscript written from a Russian frontier military post, she refers to the assertion of some English papers that "Russia has massed 5,000 men on the Tumen River," and adds: "I have been along the whole Tumen frontier, and there are just *fifteen* men, the garrison at the mud hovel from which I now write."

The Chinese and Indian tea trade was the subject of an interesting paper recently read before the Society of Arts by Mr. A. G. Stanton. In it he showed that the bad work, the slovenly manufacture, and the dishonest makeshifts which gave the name of "lie tea" to portions of the staple export of China, are merely the industrial counterparts of the political corruption brought to light by the present war with Japan. From having practically the monopoly of the British market thirty years ago, China now supplies only 12 per cent. of the tea imported into Great Britain. In seventeen years the imports of Indian tea have risen from 27,000,000 to 178,000,000 pounds, mainly because of the care in manufacture and honesty in dealing of the Indian tea-grower.

In a lecture on the Nile, before the Royal Institution, Sir Colin Scott-Moncrieff, the head of the Irrigation Department in Egypt, strongly emphasized the fact that the possession of the Upper Nile was absolutely essential to the existence of that country. If Italy, for instance, occupied Khartum, her natural and proper course would be "to spread the waters of the Low Nile over the Sudan; and no nation in Europe understood irrigation so well as the Italians. What then would become of Egypt's cotton crops?" Or regulating sluices could be built across the outlet of the Victoria Nyanza, and Egypt could be flooded or its water-supply cut off at pleasure. He held it to be evident, therefore, that the river from this lake to the Mediterranean should be under one rule. This is significant in the light of Italy's recent operations against the Mahdists and her occupation of Kassala.

According to the census of 1891, the results of which have now been published, the population of Norway at that time consisted of 2,005,880 persons, of whom 968,255 were men and 1,037,625 women.

—Mr. James Rodway's 'In the Guiana Forest' (Scribners) conveys vividly the impressions made by the great forests of tropical South America upon a man who has acute artistic perceptions of nature and a poetical way of describing what he has seen. He justly dwells, again and again, on the struggle for existence, in plants and animals, ever going on in those deep forests. He describes the native inhabitant "with rare pictorial skill," as Mr. Grant Allen observes in the introduction to the volume; and the reader, after wandering through the trackless wastes of Guiana with the author, but without maps, dates, or even compass, at last emerges with relief, and is more than ever content with his own home in a civilized land. The book must be regarded as a poem rather than as a sober contribution to natural history; for while it is full of statements in regard to plants and animals, everything is told from a poet's standpoint, and in the whole book there is scarcely a fact stated in the exact way of the great naturalist whose doctrines are here made the foundation of a long and almost monotonous dream rather than essay. The truth is, that the struggle for life, the war between animal and animal, plant and plant, or animal and plant, not less than the occasional correlation between them, can be recognized in temperate or even in sub-arctic and arctic climates, not less truly than in a steaming tropical forest. The species are fewer, there is far less of life, but the evidences of the struggle and of the survival of the fittest are not less clear. The book contains a fair number of illustrations, apparently from photographs, one of them unfortunately named "In a mango swamp," when the word "mangrove" was evidently meant. The great defect is the want of exactness above hinted at. We are not told when the author's wanderings took place, we are not favored with any map or chart of his travels; and while he has a chapter about the rivers and creeks of Guiana, not a single river is called by name.

—Few recent volumes on Dante are so rich in interest as the new and complete edition of all Dante's writings, 'Tutte le Opere di Dante Alighieri, nuovamente rivedute nel testo,' that Dr. Edward Moore, the best-known English student of Dante, has prepared for the Oxford University Press (New York: Macmillan). This interest is due not only to the fact that, strange to say, all Dante's works have been for the first time printed in a single volume, whose clear type, convenient form, and scrupulous accuracy will doubtless make it a standard edition, but to the interesting and important new readings which Dr. Moore has introduced into the text. In a writer such as Dante, who seems to have weighed, in much of his work, the effect of almost every word, even slight textual changes become exceedingly suggestive. To comment on them in detail in these columns, however, would be to burden the general reader with confusing details. Let it suffice here briefly to describe the character of Dr. Moore's work. In the 'Vita Nuova' and the 'De Monarchia' he has followed almost exactly Witte's texts; in the 'Epistolæ,' the text of Fraticelli, corrected by the facsimile of the Grenoble MS.; in the 'Commedia,' Witte's text, with such alterations as would be expected from Dr. Moore's recent work on the textual criticism of the same poem. The greatest changes are in the 'Convito,' which is for the first time carefully and intelligently edited by an expert on the basis of two good manuscripts and the published texts. The text of the 'Canzoniere' is revised by Mr. York Powell, and the poems to some extent rearranged. Mr. Toynbee has added an excellent index of the proper names and important subjects mentioned or treated in all the works. The rule has been to include in this volume all that has been generally attributed to Dante, though we notice the omission of the spurious letter to Guido da Polenta, of the three others not generally printed, and of certain verses frequently, and with some show of reason, ascribed to him. It would have been a great advantage to have the principle rigidly carried out, and to possess in a single volume every line attributed to Dante to which the student of Dante might have occasion to refer; but the public should be, and doubtless will be, grateful for this exceedingly convenient edition, which we owe to Dr. Moore's scholarship and acumen.

—'Heine in Frankreich' is the title of a ponderous doctor dissertation of more than 450 pages, with which a young Swiss-American, Louis P. Betz, a pupil of Prof. Morf of Zürich, makes his scholarly début (Zürich:

Albert Müller). Although there is a good deal of rather shallow rhetoric and irrelevant information in this book, it is, for more reasons than one, a work of most decided merit. It not only gives a detailed account of Heine's relation to his French surroundings and contemporaries but it also places before us in chronological order and with great bibliographical fulness the French opinion of Heine, from Saint René Taillandier to Jules Lemaître; it narrates, again chronologically, the numerous attempts at French translations from Heine during the last sixty years; and, lastly, it traces the influence of Heine on French poetry and thought from the Romanticists and Parnassiens down to the most modern symbolism. Compared with the heated discussions as to Heine's poetic merits which have been raging in Germany ever since Menzel's violent attacks on him, the nearly unanimous appreciation of his genius on the part of the French critics, as brought out in this book, is truly remarkable. All the more so since Heine himself confessed that he always felt a stranger in France: "Mein Geist fühlt sich in Frankreich exiliert, in eine fremde Sprache verbannt." The last part of this remark, *i. e*, Heine's inability to enter fully into the spirit of the French language, is fully confirmed in an interesting chapter of Dr. Betz's book, in which it is proved beyond doubt that Heine never acted without assistance as his own translator. How slovenly and ungrammatically he would sometimes write, is demonstrated by several of his letters published in this connection. In one of them, addressed to Balzac, we have the sentence: "Accusez-moi *avec* deux mots la reception de ces lignes affin que," etc.

—The meagreness of the English records relating to Joan of Arc, considering the prominence of her exploits in the long conflict between England and France, has often been remarked. Of the documents dealing with her life and adventures which have thus far been discovered in England, none actually gives her name. An extract from a long petition from the Duke of Bedford to the King, in which Joan of Arc is described as "a disciple and lyme of the Feende, called the Pucelle, that used fals enchauntements and sorcerie," is given by Rymer. The Abbé Henri Debout, having failed to find the manuscript referred to by Rymer—"A. D. 1428, An 7 H. 6, Cott. Bib. Titus E. 5"—and being unable to account for its disappearance upon any reasonable hypothesis, concluded that no such manuscript had ever existed, and that the reference given by Rymer was spurious. An account of his search and of his conclusion has just been published at Paris in a brochure entitled 'Jeanne d'Arc et les Archives Anglaises.' Such an attack upon the English historiographer was not likely to pass unnoticed; and in the London *Athenæum* for January 12 Mr. J. M. Stone gives an account of his successful effort to verify the reference. The occurrence of the same reference in the appendix to the fifth volume of the 'Rotuli Parliamentorum,' from the eighteenth year of Henry VI. to the close of the reign, seemed to confirm Rymer's accuracy; and a careful search of the volume Titus E. 5 was rewarded by finding the above-quoted extract from the petition of the Duke of Bedford on folio 372. So that, to quote Mr. Stone, "the fragment in question is where Rymer, Topham, and Astle said it was, and M. Debout is not only mistaken in declaring the absence of any such document, but his theories founded upon its non-existence, and set forth in his pamphlet, are without the slightest foundation."

—Augustus Strindberg, the Swedish writer, who is equally well known as misogynist and as playwright, has lately been visited by a representative of the *Temps* at the hospital of St. Louis in Paris, where he has been confined in consequence of some indiscreet chemical experiments. Strindberg's mind, according to his own account of it, is many-sided, and it is a little hard to make out where his chief interests lie. He studied medicine at first, but took to the theatre in 1870. His second play, "Master Olaf," was refused, and he went into other work, entering the Royal Library at Stockholm, and devoting himself to scientific and historical labors. He wrote a history of Sweden in two volumes, and in 1879 he presented to the Academy of Inscriptions in Paris a memoir on the relations between Sweden and China. In 1880 his "Master Olaf" was played with success, and this brought him back to the theatre again, and led him to write the twenty or more plays which have made his reputation. In 1883 he went to Paris, where he collaborated with Leconte de Lisle, Coppée, Hérédia, and others in the *Monde Poétique*, a Parnassian review. Since then, he says, he has made some slight contributions to science, such as a new process of celestial photography, the extraction of carbon from sulphur, and the demonstration of a nervous system in plants. Last year he published, in German, "the first fascicule of a great work, the 'Antibarbarus,' which will be a complete revision of the physical and natural sciences." His latest triumph, so far as we have noted, is in a "vivisection" in the *Revue Blanche* for January, entitled "De l'infériorité de la femme." In it he gathers together in a pleasing mass everything that he can find to his purpose out of all the men of science from Aristotle to Lombroso, and all the philosophers from Rousseau to Nietzsche, and launches it full at what St. Augustine calls the *devotus fœmineus sexus*. That more patient and gentler sex seems not yet to have turned its attention to him, or to have remonstrated with him. When it does, he may perhaps seek safety among the explosives of his laboratory.

—The second Memoir from the Biological Laboratory of Johns Hopkins University is a monograph of the genus *Salpa* by Prof. W. K. Brooks, the result of many years' investigation of a difficult and technical subject. A summary of the author's conclusions on the origin and development of the life of the open sea, to which he devotes a chapter, is not without general interest. He first points out that practically all pelagic animals are carnivorous, and that there is nothing in the sea comparable with the great army of highly organized herbivora of the land. Plants are rare away from the shores, and consist of minute unicellular algæ and diatoms. On these the small shrimp-like copepod crustaceans feed, little creatures of which thousands may be contained in a glass of sea-water. These copepods are the real harvest of the sea, and the basis on which the subsistence of the more highly organized carnivores depends. All highly organized pelagic animals give evidence of having passed through a stage of life connected with the coasts, the land, or the sea-bottom. The largest existing animals are pelagic, but the few which are primitively pelagic are very small and simply organized. The latter fact is due to the easy conditions of pelagic life, in which there is no fierce competition, and the environment is so simple that there is little chance for diversity of habits. Survival is determined by accidental space-relations rather than by a struggle of competitors.

—The primitive pelagic fauna consisted of small animals of simple structure, but representing a number of diverse types. The appendicularia and veiled medusæ are also regarded as primitive types, and from the copepods the author would derive the whole group of crustacea. This fauna probably flourished at the surface before the bottom of the deep sea (owing to a want of oxygen and other causes) was habitable. Marine life is older than terrestrial life, and as all marine life has shaped itself in relation to the pelagic food-supply, the latter is the only independent factor, and must therefore be the oldest. For a vast period of time life consisted of an innumerable multitude of a few pelagic types living at the surface. No great advance took place until the sea-bottom became habitable. Bottom colonies started in shallow water were exposed to numerous accidents from which those at greater depths were free, and it is possible that the first deep-water fauna may have been the one to persist and the source of most modern forms. Crowded on the bottom, the colonists were brought into competition with each other; divergencies and differentiation arose. Since competition must always be sharpest between near relatives with similar habits, the connecting forms were rapidly eliminated. The olenellus fauna of the Cambrian, the oldest fauna known, may not have represented a long period of slow differentiation into types, but, from its approximation to the hypothetical colonies, may perhaps represent a rapid differentiation of forms comparatively near to the primitive fauna of the Archæan Sea.

MASTERPIECES OF GREEK SCULPTURE.—I.

Masterpieces of Greek Sculpture: A Series of Essays on the History of Art. By Adolph Furtwängler. Edited by Eugénie Sellers, with 19 full-page plates and 200 text illustrations. Charles Scribner's Sons. 1895. Pp. xxiii., 487.

No one is announced as the translator of this work, and the lady who is mentioned as editor makes it clear, in her long preface, that she has taken the book to pieces and put it together again in a fashion which would seem to make her a joint author. So numerous are the changes, announced and implied, that the editor finds it necessary to state that in certain cases she has preserved the original text. "Here," the editor says, speaking of the chapters on the Venus of Milo, the Apollo of the Belvedere, and the Acropolis Temples, "the only alterations are those that have been introduced by the author himself." Mention of the theories of those who have disputed the Pheidian origin of the Parthenon sculptures has been "relegated to foot-notes." Reference is made "throughout to the English edition of Prof. Helbig's 'Museums of Classical Art in Rome,'" a book which we are told is to appear almost simultaneously with the present one. Compression has been freely used, and the editor confesses to having "left rather more to the imagination of the reader than is usual in a German work of this nature." Forty-five illustrations are given which were not in the German edition, and the editor states that she has tried, in arranging them, "to con-

vince the reader of what great results might be achieved with the help of a collection of casts comprising . . . all or nearly all the extant products of classical art, whatever their period, and supplemented by a complete series of photographs." Photographs have been used in place of some inferior illustrations of the German edition, and these new pictures the editor introduces with special mention.

It is true that Prof. Furtwängler is stated to have sanctioned all the editorial alterations; but it still remains apparent that this is a work by Prof. Furtwängler and Miss Eugénie Sellers, and that the competency of the editor as well as of the well-known Berlin professor is involved. The author's preface stands, however, dated Berlin, 1893, as his declaration of his intentions in his important essay. He announces, speaking of his inquiries into sculpture, that "the material treated in this book consists for the most part of antique copies," and he explains that this is because most of the important works of antiquity can be known to us by copies only. He claims for the Roman copies of early Greek and Hellenistic sculpture a special value as distinguished from the originals found in Greece and in the islands of late years. The copies, he thinks, have preserved for us "that pick of the masterpieces of the classical epoch which pleased ancient taste and connoisseurship in the times of highest culture." The assumption is, of course, that the greater number of original Greek works recently discovered are not such masterpieces—in which assumption the author is on safe ground; but he thinks, moreover, that it is possible to discriminate in the copies between what is derived from the original and what is added by the copyist. It is pointed out that a close comparison of the different existing ancient copies, not hitherto feasible, can now be carried on by means of photographs. He admits, however, the "rich mine of error" which is to be found in inquiries of this kind.

It will be thought by many that another "rich mine of error" is to be found in the attribution of existing works to celebrated ancient artists. The author seems to be aware that he has been bold in this matter of attribution. Assuredly an extremely cautious, almost an agnostic, position befits the investigator in these matters. Thus, as all we know of the characteristics of Skopas's work in sculpture is by inference, by putting this and that together and drawing the conclusion that Skopas must have been an artist with such and such characteristics, it is rash to ascribe individual works to the school of Skopas merely because they are found to possess the same characteristics. To do so is to make a conventional Skopas; it is to create a sculptor of a certain peculiar order of merit and to call the sculptor "Skopas," and the works in question the work of the "Skopasian School." There is no doubt that the German plan of starting theories, right or wrong, and of considering him a poor and unprofitable scholar who has no new theories to offer, has been the cause of a great advance in scholarship. It is not the less certain that, given any particular theory, one should be slow to accept it even if an excellent German name is signed to it. Each student must form his own opinions as to the relative rashness or conservatism of each separate archæologist.

An examination of the text shows much of that "boldness of attribution" which the author thinks we shall find in his work, but also a willingness to go with previous writers in their conclusions, though their names may not be mentioned. An instance of such an acceptance of received attributions is the assumption (p. 295) that the group in Munich, No. 96 of Brunn's catalogue, is a close copy of the Eirene and Ploutos of Kephisodotos. This is also an instance of the general tendency in archæology to reason too closely from slight evidence; to set up a probability, and then to argue from it as from a fact. The Munich group may well indeed be a copy of the original work described by Pausanias, but to assume that it is such a copy, and a close and accurate one; to find in the treatment of the drapery an intentional resemblance to the drapery of Pheidias sixty years before; to infer from this that the sculptor had the deliberate purpose to embody in his statue the national hopes of the Athenians of a revival of a maritime supremacy like that of the days of Perikles and Pheidias, is to argue in a circle. Such theories are admirably suggestive if treated as theories and suggestions, and it is as a suggestion only that this very theory is stated in Brunn's invaluable catalogue and in Friedrichs-Wolters' 'Die Gipsabgüsse Antiker Bildwerke'; but the tone of the text before us is not suggestive nor theoretical.

In the chapter devoted to Pheidias (p. 6) occurs a curious instance of the way in which this sort of argument is conducted. The two statues of Athena from the Chigi collection now in the Dresden Museum, Nos. 69 and 72 of Hettner's catalogue, being under discussion, there is question as to what was held in the right hand, which, with the arm, is missing in either statue. A cast of a gem is cited, the original gem being unknown to the author and editor, and the author's note states that, from the cast or impression, he had thought it modern, but now thinks it of the time of Augustus. This cast, of which a cut is given, shows a head, very fairly like the heads of the two statues under consideration, with "the short, knotted-up hair, leaving the ear free, the fillet, the neck, the opening of the drapery on the breast, even the folds falling over the left breast, the transverse ægis, and the raised left upper arm." Certainly there is good reason for the supposition that the gem was copied from a statue of the same type as the two Dresden statues. In the field of the gem, near and a little above the right shoulder, is a small crested helmet, and with this helmet the text before us deals in the following words (p. 6): "In the field in front of the left shoulder is a helmet. Such objects on gems are never mere 'symbols' as they are on coins; therefore I think it quite certain that the artist, who had not room in the picture for the right arm, wished at least to indicate that the goddess bore a helmet in her right hand. This trait completes our conception of the original statue." That is all. Observe the reasoning: the cast is from a gem, probably of Roman time though long thought modern; it gives a head very like the heads of these two statues; there is a helmet in the gem near the right shoulder; therefore the original statue (*i. e.*, the lost bronze which it is hoped to restore in thought by consideration of its supposed copies) had a helmet in the right hand.* Good theorizing, excellent and fruitful suggestion; but how about the phrase "quite certain," and the statement in the succeeding paragraph about "the composition which we have thus won back"?

*A. S. Murray, in his 'History of Greek Sculpture' (1893), suggests that the helmet was in the hand, his reason being that ancient writers dwell on the beauty of the face, which would otherwise have been hidden. He gives a terracotta statuette holding the helmet in the right hand, with the forearm extended.

The rest of the argument, which goes to show that the lost original was the Lemnian Athena by Pheidias, described by Pliny and Lucian, is similar in character to the arguments previously cited. It is full of suggestions which show a wide knowledge of extant sculptures and a great quickness of eye and of memory in bringing things together; but each step in the argument is long, and there is indefinite possibility of other suggestions arising which will make those steps hereafter impossible. It seems odd, by the way, that these statues in Dresden should be spoken of as life-size when the catalogue itself gives them as seven feet high. Let the statues in question be called hereafter the Lemnian Athena—that will do very well as a name of convention, like the name Panathenaic given to the frieze of the Parthenon; but as for a reasonable certainty of the names being correct, that is another matter. It should always be kept in mind that not one existing piece of sculpture is known to be by Pheidias. All attempts to judge by internal evidence that a given work of art is a copy of one of his must proceed in a tentative way, as thus: The sculptures of the Parthenon must be by him, at least in part, because he was the best sculptor of his time, and these are the best works of the time; because, moreover, Plutarch states (we quote the Dryden-Clough translation) that "Pheidias had direction of all the works and was surveyor-general"; but as the sculptures of the Parthenon are by him, so other works in which the drapery is cast in a similar way, and so on, must also be by him. We say again it is a matter of convention: it is a Pheidias of convention who executed the Parthenon sculptures, and whose style we learn to judge from them, and this conventional Pheidias was very probably the author of the lost original statue from which the Dresden statues are copied. Of the real Pheidias less is known. It is altogether well that some ascriptions should be accepted as working hypotheses, but only on condition that their lack of confirmation by direct testimony should be admitted continually. In this direction it is really a pleasure to meet with a statement like that on page 307: "Our knowledge of the art of Praxiteles rests primarily on the extant original statue, the Hermes of Olympia."

All this extreme readiness to fix names and dates, and to decide upon as fact that which is only approximate probability, is harmless when addressed to archæologists. They will be ready to distinguish the settled and certain from the probable and plausible, and they will be only too ready, with this as with the parent work, the 'Meisterwerke der Griechischen Plastik,' to object to all, even the most probable theories, and to set up others over against them. Treating this book, then, as a book for the archæologists, it is of really extraordinary value. The readiness of suggestion, the immense knowledge of the extant works of art from which to draw suggestions, the swift dexterity with which one work of art is used to interpret another, make this a really epoch-making work. If the German original were under consideration, little else than these merits would need to be spoken of; but the offering of an English version very fully illustrated is, almost of necessity, the offering of a book for the artist and the general student of fine-art.

In this capacity, as a work for general reading, the illustrations are of supreme value. The less known and less accessible sculptures are those chosen for photographing, such as statues and busts in private collections; those newly discovered; those if not newly disco-

vered, at least newly put in places easy of general access; those which have hitherto excited little attention; and finally those which may be said never to have existed before in modern times, made up as they are of pieces brought together according to new suggestions. Thus, we have among the eighteen large photogravures two views of the statues of Athena in Dresden named above, one of those statues modified by the substitution of a plaster cast of the Bologna head (Friedrichs-Wolters, 519) for its previously attached head in marble, and with these a side view of the Bologna head by itself and on a large scale. Here, too, is a photogravure of the Amazon at Lansdowne House in London; a statue in the Villa Medici at Rome, completed by placing upon it a head called the head of Meleager; a little-known female head in Lord Leconfield's collection, and a splendid bronze bust which, though in the Louvre, is assuredly not often cited. The two hundred text-illustrations, principally photographic, are equally important except in the beauty of the prints. Many of them give in different aspects the same works which are shown in the plates. Among them are also the Hermes of the Palatine Hill, now in the new museum at Diocletian's Baths in Rome, a wonderful statue in the Barracco collection at Rome, the Farnese Gladiator in the Naples Museum given without the restorations, and other statues similarly put back into their actual condition as broken, but no longer disguised, vestiges of antiquity.

Among the illlustrations which are not photographic, the more important serve to show the author's decision as to the proper original condition of a work of art. Such is the restoration of the Aphrodite of Melos (p. 380), her left hand holding an apple resting upon a square pillar, and her right hand sustaining the drapery on the left thigh. Such is the restoration, page 127, of a badly restored statue in the Vatican, the so-called Alcibiades; the changes from the statue as it now stands in the Hall of the Biga being not radical in character but extremely suggestive, and giving a Greek aspect to that which had been made into a pseudo-Roman warrior. Such is the restoration (p. 88) of a torso in the Cassel Gallery as a Hephaistos in the spirit of a head in the Vatican; the two fragments being combined into a true-seeming Greek statue.

THE DEAD TSAR.

Alexander III. of Russia. By Charles Lowe, M.A. Macmillan & Co.

THE private character and sovereign deeds of the late Emperor Alexander III. of Russia are likely to furnish material for debate during a long time to come. Mr. Lowe has acted wisely, from a business point of view at least, in getting his Life of the Emperor promptly upon the market; and, until M. Anatole Leroy-Beaulieu shall see fit to give us his opinion on the subject, this Life will, probably, exert a widespread influence. This is unfortunate for Russia and the foreign public, but will, no doubt, be profitable to Mr. Lowe. The public loves dearly an overwhelming arraignment, a crushing condemnation of things and people, especially of powerful things and people. That is, practically, what Mr. Lowe has given us—a denunciatory history from a thoroughly British standpoint.

The plan of his book is very good. In a well-digested preliminary chapter he relates the history of Alexander III.'s ancestors, beginning with Catherine II. Within that hundred-years' limit we must, in effect, seek the genesis of most of the traits embodied in the character of any modern Emperor of Russia down to the present date, though historical precedent now bids us look for a fresh departure—so far as the strong national characteristics and traditions will permit—at any moment. But, from the outset, Mr. Lowe is inclined to adopt the least favorable version of any historical incident, and to omit significant details which would cast quite a different light upon the monarch with whom he is dealing at the moment. For example: he states that Nicholas I. was made to succeed Alexander I. in 1825 because the rightful heir, the intervening brother, Constantine Pavlovitch, was such a startling copy in mind and person of his mad father Paul that he had to be passed over, and allowed to indulge his brutal and eccentric passions in the innocuous obscurity of private life. If true, that would be the reverse of discreditable to Russia, but it has always been accepted as a fact that Constantine voluntarily resigned his right to the throne in order that he might marry a fascinating Polish Countess. Again, Mr. Lowe states that Nicholas I., on his death-bed, exhorted his son and successor to liberate the serfs. He would have done more justice to the characters of Alexander I. and Nicholas I. had he mentioned the projects for liberation and the actual liberation effected by those sovereigns. The omission tends to intensify the faults of temper and government which he attributes to them.

Mr. Lowe, as correspondent of the London *Times*, was the only English newspaper man admitted to the cathedral at the coronation of Alexander III., of which he gives a vivid and interesting description; and he also saw state festivities in Berlin on the occasion of a visit of the late Emperor (whom he wrongly calls "the Russian Emperor") to the German Emperor. But his information is almost wholly derived from other persons, such as "E. B. Lanin," Mr. W. T. Stead, Prof. Geffcken, and English newspaper correspondents, to whom he always gives due credit. That Russian sources of information were not directly open to him we have a right to infer from his anecdote anent Alexander III.'s Teutophobia, on p. 25. Had he known even the Russian alphabet he would not have printed that anecdote, of manifestly German invention; "Woronzoff" is spelled with a *v* in Russian, and *v* is the third letter in the Russian alphabet, not almost the last as here represented. The "supper of sour milk and prostokvasha rusks" (p. 277) proves the same thing. "Prostokvasha [bonnyclabber] and rusks" was the statement of Dr. Zakharin, as printed officially in the Russian press; "prostokvasha rusks" being non-existent.

The question is, to what degree is an Englishman, who is totally unacquainted with the language, and but little acquainted with the habits and minds of the Russians, while thoroughly imbued with a British patriotism which approaches violent Russophobism, to be trusted in the choice of his quotations and in the deductions which he draws therefrom? He sets out with an evident desire to be fair, but his style speedily becomes so intense that the reader feels as if his brain were being belabored, and he is physically exhausted. In general it may be said that Mr. Lowe, while *apparently* doing full justice to the late Emperor's fine personal character, good intentions, and, in the main, good performance, contrives to strip him of every virtue. The Emperor's firmness was pig-headed obstinacy; his domestic virtues arose from a phlegmatic temperament; his devout religious faith was superstition; his earnest efforts to do his duty and to attend to all possible details proceeded from a rather absurd idea that God had placed him on the throne, and had for its result merely that his mortal shortcomings and errors are to be reckoned up against him, while his good qualities are to be considered as fit only for a private gentlemen, as concerning his family alone, and as decidedly detrimental to a monarch. There is nothing new or original in this view. It has long been, and will long continue to be, no doubt, the popular and profitable view of the case. Mr. Lowe falls short exactly at the point where all his collaborators and cothinkers fall short: he fails to explain who placed Alexander III. (and his predecessors) on the throne, and what standard we are bound to adopt, for ourselves and others, in lieu of the vital importance of developing high personal character and devotion to duty with what talents we may chance to possess, as we have been exhorted to do by Christian preachers and pagan philosophers. To cap the climax, Mr. Lowe presents us with this problem: Alexander III. kept the peace of Europe simply because he was a coward ("his physical courage was never of the highest"); he twice did his best, despite this cowardice, to bring about a war; and the real peacemakers were the German Emperors and Bismarck—which would seem to leave the author's much-admired Germans (p. 312) also under the imputation of cowardice.

What Mr. Lowe says, on p. 117 and elsewhere, about the Franco-Russian alliance and interchange of naval visits is good. The best-informed Russians who were placed near the Emperor, at the time of the famous visit of the French fleet to Cronstadt, did not hesitate to designate the affair as a "farce." As Mr. Lowe shows, the responsibility for the farcical element did not lie with Alexander III. or the Russians. His statement of the Jewish question in general is fair, and the retort of the *Novoe Vremya* (p. 109) to the English protest on that question is worth noting and remembering. He comes to the just conclusion, after carefully balancing the statements of Mr. Harold Frederic and M. Leroy-Beaulieu, that the question of religion involved is only subordinate. It is rather singular, however, that, after describing the "Pale of Settlement" for the Jews as being nearly eight times the size of England and Wales, and quoting the Guildhall memorial about 5,000,000 Jews being "pent up in narrow bounds," it should not have occurred to him to explain what hardships are endured by the 29,000,000 inhabitants of England and Wales, as compared with those endured by 5,000,000 Jews in a tract eight times as great.

In quoting the famous case of Prince Barclay de Tolly, whose action in having his children baptized in the Lutheran Church (his wife being an Orthodox Russian) entailed his dismissal from the Guards and the army, Mr. Lowe is evidently not aware that it was an isolated, not a representative, case. It is a fact that there were, among the court officers of the late Emperor, Lutherans married to Orthodox Russian women, whose children were brought up as Lutherans without let or hindrance. When Mr. Lowe characterizes the Russian Church as "the embodiment of the most debased and spurious form of Christianity," he is plainly ignorant of the close kinship, almost identity, of the Russian and the Anglican-Catholic or Ritualistic branches of his own national church. When he speaks (p. 189) of

the Baltic provinces as "the old Teutonic Fatherland," he forgets the significant bit of Russian history that exposes the manner in which the Knights of the Teutonic Order conquered those provinces with sword and blood, imposed on the inhabitants—who still speak dialects of a language not even cognate with the Indo-European family to which both German and Russian belong—a German aristocracy and the German tongue. He does admit, in a quotation from Mr. Pobedonostzeff (whose Russification of these provinces he strongly disapproves, as if it were the first instance of the sort, instead of the second, in their history), that "Protestantism, as represented by the Livonian Knights, was equally animated by secular motives." Mr. Pobedonostzeff is sound in his history at least.

Blind faith in "E. B. Lanin" leads Mr. Lowe into another pitfall of misunderstanding. Lanin asserts (p. 198) that the Russian officials are considering the advisability of keeping down the pride of the peasants by treating them as an inferior class and addressing them as *thou* and *thee*, instead of by the more respectful *you*. As a matter of fact, that form of address has always been in use, not only from master to serf, from landholder to free peasant, and between the peasants themselves, but also from peasants to the gentry, in token of familiar affection and respect; just as a high ecclesiastical personage on the most solemn occasions, or a peasant on any occasion, would address the Emperor himself with *thee* and *thou*. Other errors are, that the Grand Duke Constantine, junior, was suspected of complicity in the Nihilist plot which ended in the death of Alexander II.; that the late Emperor's journeys were "hurried and furtive"; that the Grand Duchess Marie Pavlovna was not permitted to accompany her husband, the Emperor's brother, on his tours of inspection, because her beauty and kind-heartedness rendered her popular and made Alexander III. afraid of her influence over the troops. It was commonly understood that the objection lay in the Grand Duchess's persistent efforts to win influence by begging the troops to address her as "Aunty Molly."

Mr. Lowe's statement of the Battenberg-Bulgaria complication is clear and good. So is his summary of all that is known of the young Emperor, Nicholas II., though, as in the case of his father, it is still too early to pronounce judgment with absolute authority; and his epitome, drawn from the Russian papers, of Alexander III.'s great funeral progress through Russia and his magnificent burial services. It is a pity that he omitted to reproduce the touching details, mentioned by the Russian papers, of the sorrowing throngs of peasants who knelt and wept as the train passed throughout the length of the land, and who stood patiently in line for days to kiss the hand of the dead Emperor in farewell.

While his claim that England, rather than Russia, was the peace-keeper in 1877 is too weak to discuss, Mr. Lowe records the state of affairs at that time clearly and well, with a few exceptions. His English is often of the awkward, fantastic sort known as "newspaper English," which is unworthy of a serious history like the one he has attempted, and, on the whole, written: "To worsen"; "the officers shouldered high the Prince"; "gave the loose to"; "his preaching caught on"; "it was here where." On p. 107 "1889" should read "1890."

DE MÉNEVAL'S MEMOIRS.

Memoirs Illustrating the History of Napoleon I. from 1802 *to* 1815. By Baron Claude-François de Méneval, edited by his grandson, Baron Napoléon-Joseph de Méneval. With portraits and autograph letters. 3 vols., 8vo, pp. xxi, 421, 484, 545. D. Appleton & Co. 1894.

It may be true that a man is never a hero to his valet; if this is so, between valets and private secretaries there is a great gulf fixed. As time goes on, the private secretary becomes entirely moulded to his master's will, and follows him with doglike fidelity. Of all those who were attached to the first Napoleon in close personal relations, no one seems to have surpassed the Baron de Méneval in exhibiting the peculiarly canine virtues. The blood of a race of courtiers filled his veins. The terrors of the Revolution came and went before he was out of the nursery, and when he was old enough to seek a vocation Napoleon's name and fame were already filling France. Amiable, well-bred, light-hearted, but honest and loyal, a dilettante in literature, and neither too philosophical nor too inquisitive, De Méneval was fitted to be the favored servant of either a Bourbon or a Bonaparte. When his acquaintance with Napoleon's brothers brought him in 1802 a summons to the presence of the First Consul, the young Baron betook himself to the Tuileries in such a shiver of mingled fear and exultation as his grandfather may have felt in the halls of Versailles.

There was nothing republican about young De Méneval. "Napoleon," he wrote in deferential phrase, "condescended to receive me with a kindness which at once dissipated the respectful awe in which I stood." Napoleon took his measure in one keen glance, walked up to him, pulled his ear, and said: "Come back to-morrow morning at seven and come straight here." Such was "the conversation," said the Baron, "which preceded my admission into this sanctuary, which I imagined as a sort of place from which nothing but invisible oracles proceeded, accompanied by lightning and thunder." Henceforth De Méneval was installed at Napoleon's desk. Shortly afterwards he succeeded the more famous Bourrienne, whose alleged memoirs he rejects as mainly spurious, and he remained hidden within Napoleon's shadow until the Corsican himself passed into permanent eclipse at St. Helena.

De Méneval could not divest himself of the habits that had become his second nature. He had acquired a kind of proprietary interest in what seemed to him to be the glory of Napoleon. During the rest of his existence he lived upon the remembrance thereof, and it appears that this remembrance is still the treasured inheritance of his posterity. Napoleon foresaw that the scribe would never be able to shake off his office:

"The Emperor said to me one day: 'In the order of things I must die before you. When I am no more, what will you do? You will write.' I was not prepared for this thought of death thus unexpectedly expressed, and Napoleon seemed to me immortal. As I did not answer him immediately, he added: 'You will not be able to resist the desire to write memoirs.'"

De Méneval did live on with pen in hand. He helped to inspire Thiers to write his chauvinistic history of the Consulate and Empire, and before his own death in 1850 he produced the story which fills these three volumes and fulfils Napoleon's prophecy.

The value of these memoirs is scarcely proportional to their bulk. They contain neither inspiring narrative nor profound analysis. The Baron was incapable of either. It is impossible to compare them with the thoughtful memoirs of the Chancellor Pasquier, and they do not contain a trace of the spice that enlivens the reminiscences of the Rémusat family. The volumes may serve to show, what we knew before, that Napoleon elicited a blind, unquestioning devotion from civilians as well as soldiers. Unstinted adulation and extravagant panegyric are the warp and woof of these books, and the tone often becomes very shrill. Thus, in the preface, we read:

"The revelations which time will bring will show Napoleon raised on the summit of greatness by means of which morality approves; they will show him *free from all baseness, straightforward, magnanimous, exempt from low passions*, endowed with every kind of courage, constantly occupied with the care of ameliorating the condition of humanity."

From one end of his story to the other the Baron will not admit a single shadow upon his hero.

"The consciousness of his own strength rendered recourse to oblique and mysterious ways unnecessary for him; in matters of politics at home and abroad he often proceeded with a frankness which was sometimes pushed to the extreme of brutality; his honor and his sentiments of personal dignity would never allow him to have recourse to deceit or corruption."

Can the Puritan philanthropist whom the Baron thinks he knew be identical with the man who kidnapped and murdered the Duc d'Enghien, who despised and habitually insulted women, who seduced Mme. Walewska, who contemptuously belittled the sacrifice of a million of men to his own ambition, who filled his diplomacy with lies, and relied constantly upon the aid of those spotless advisers, Talleyrand and Fouché?

Moreover, De Méneval is impressed by Napoleon's heartfelt piety.

"Bonaparte was sincerely religious; I may add, a true Catholic." "His habit of involuntarily signing himself with the cross, . . . his expectation of help from above at a decisive moment in his battles, the religious ideas which the sight of a church or the sound of church bells awoke in his mind, his taking refuge in the consolations of religion during his last moments at St. Helena—do not all these things testify to his faith in Providence?"

In this connection the Baron forgets his own testimony to Napoleon's marvellous truthfulness. "When he attended in Egypt the religious ceremonies of the Mohammedans, his faith had not changed in the slightest degree. He was acting in the interests of a clever and well-matured policy." The Baron's zeal to show Napoleon's religious fervor is quite untrammelled by limitations of language. Thus he writes: "When Napoleon wrote to the Directory that, having seen at the moment of landing in Egypt a sail which he believed to belong to one of the enemy's ships, he had implored Fortune not to desert him, but to grant him five days more, he mentally translated the word 'Fortune' by 'the Almighty God.'"

Contradictions in Napoleon's language or character are all resolved for this eulogist and perplex him not, but possibly De Méneval's labors over Napoleon's correspondence taught him how to keep his right hand in ignorance of the deeds of his left. The translator kindly sets up a mark at all places where De Méneval's story is at variance with itself, and the signals are numerous. One illustration will suffice: De Méneval says that Napoleon never saw Bourrienne after October 20, 1802. Yet the next sentence runs on thus: "When, in

1805, the Emperor, forgetting his offences, appointed him plenipotentiary minister to Hamburg, he granted him the usual audience, but did not add to this favor any return of his old friendship." Such discrepancies, though slight, must cast doubt upon the author's carefulness and upon his methods of composition, especially on account of the repetitions of negligence.

Nevertheless, with all this scribbler's weaknesses, his inaccuracy of statement, his needless and monotonous narrative of campaigns, his superficial judgment, and his irrational hero-worship, these volumes are not entirely devoid of interest. The reader watches for the testimony which the servant gives concerning the life of his master. De Méneval could not well avoid telling some things about Napoleon in his moments of relaxation, when the Emperor had lapsed into the Corsican soldier. Not all the Baron's rhetoric can conceal the confirmation which he unwittingly brings to the sarcastic strictures of enemies like Mme. de Rémusat. No less striking are the illustrations of Lombroso's theory that Napoleon, like so many other men of genius, was the victim of partial insanity. Thus, Napoleon was unreasonably fitful in mood and abnormally sensitive where such weakness would be least expected. Wax models of human organs caused in him such spasms of nausea that he had to abandon the study of physiology, yet he never shrank from the gory sights of a battle-field. He was so irritable as to be liable to nervous convulsions which were perhaps associated with epilepsy, aud he was correspondingly fickle in temper. "When excited by any violent passion, his face assumed a terrible expression. A sort of rotary movement very visibly produced itself on his forehead and between his eyebrows, his eyes flashed fire, his nostrils dilated." He fell into a furious rage with De Méneval because a parcel was not punctually delivered, and "scolded," wrote the Baron, "with so much volubility that I was unable to get in a single word." This recalls Napoleon's more famous tirades against the English ambassador and against Talleyrand. Shortly after, the tempest blew completely over, and Napoleon greeted the Baron again as his "dear little Méneval." He covered his peevishness with a characteristically shrewd observation, "There are circumstances in which it is necessary for me to put my confidence in quarantine."

Again, the Baron witnesses to Napoleon's megalomania. He was always proclaiming his superiority to the limitations recognized by other men. Even in little things he wished to show himself superior to all others. He found Marie Louise making an omelette, and at once took possession of the utensils in order to show her how the thing ought to be done. The result was what might have been expected: the dish was speedily spoiled. Although he had an abnormal power of memory of details, yet he invariably increased the totals of the rosters of his battalions, apparently wishing to believe that his resources were even greater than they were. He was, however, curiously incapable of performing simple computations correctly. Like Monge, who could solve abstruse mathematical problems with ease, but could not work out a simple algebraic equation, Napoleon quickly understood difficult questions in mathematics or strategy, but could rarely find the true total of a sum in addition. This strange illiteracy manifested itself in other ways. Some words he could never spell correctly. Thus "cabinet" was always "gabinet," and "afin que" was always "enfin que." The act of writing was painful to him, and he seldom had the patience to complete his sentences. Even then his script was usually illegible even to himself. Once with infinite pains he wrote an autograph letter to his Hapsburg father-in-law, but De Méneval's pen had to trace the lines after him.

Another imperial habit, interesting to alienists, was Napoleon's sleeplessness and irregular habits of nocturnal labor. "It sometimes happened that I would hand him some document to sign in the evening. 'I will not sign it now,' he would say; 'be here to-night at one o'clock or at four in the morning; we will work together.'" "I used to find my writing-table in the morning covered with reports and papers annotated in his writing."

One of the best portions of the Baron's story is his description of the means employed to alienate Marie Louise from Napoleon after the latter was sent to Elba. The Baron was, in effect, Napoleon's representative near the Archduchess after she passed once more into Austrian hands. Helpless, he beheld the skilful manœuvres by which her natural attachment for the father of her child was checked, undermined, and finally diverted entirely to another object. One can almost see the woman's character change. She had become partially French, but the original Austrian was wonderfully restored. This story of metamorphosis has small political importance, but its human interest is considerable. One cannot help admiring the lively old grandmother of the Archduchess, who counselled her to tie her bedsheets into a rope, let herself down from the castle window at night, and run away to Elba.

The translation is indifferently well done by Robert H. Sherard. Readers are warned at the outset that the translator has tried to give a literal rendition in order to reveal the man—as though there was anything in De Méneval that was worth revealing! Even this announcement would scarcely excuse such unnecessary sentences as these: "The sovereign of Sweden comes to be dethroned," and "The discussions of the umbrageous and speculative minds who dominated in the National Tribune."

The Life of Edward Bouverie Pusey, D.D., Canon of Christ Church, Regius Professor of Hebrew in the University of Oxford. By Henry Parry Liddon, D.D., late Canon of St. Paul's. Edited and Prepared for Publication by the Rev. J. O. Johnston, M.A., and the Rev. Robert J. Wilson, D.D. In four volumes. Vol. III. Longmans, Green & Co. 1894.

THE period covered by this volume of Dr. Pusey's biography—from 1845 to 1858—his biographers consider the most important of his life, and they are probably right. Newman, until his secession, was the recognized leader of the Tractarian Movement. After his secession, Pusey took his place, and his influence was immense both in Romanizing the Anglican temper and in keeping those whom Newman had Romanized with the help of Pusey and others in the English Church. Twice he did more than any other to prevent a stampede to Rome—once after the secession of Newman, and again after the decision of the Gorham controversy in a fashion hostile to the Romanizing party. The constructions advocated by Newman in "Tract 90," if not now the dominant constructions of the English Church, enjoy a legal security equal to any others, and an ever-widening influence and acceptance; and for this Pusey deserves more praise or blame than any of his contemporaries. In 1858 the battle was not ended, nor the victory gained, but the hardest fighting had been done.

However important the period from 1845 to 1858, both for Pusey and the Church, its history is far less interesting for the reader than that of the years when Newman was upon the stage and took the leading part. It is hard to say why Pusey is so much less dramatic a figure than Newman, but of the fact there is no doubt. Newman never was subjected to a tithe of the humiliations and rebuffs that were visited upon Pusey by his ecclesiastical superiors. If he had been, he would not have delayed his march to Rome so long. The temper of the two men was very different. Newman had a great hankering for authority, but was quick to feel and to resent its bond. Pusey, with far less self-assertion, kissed the smiting rod, and went about to discover in himself some secret fault which had deserved the punishment.

In this volume of 488 pages we have first an account of Pusey's early efforts for the establishment of Anglican sisterhoods, and next an account of his earlier relations with Samuel Wilberforce, who succeeded the more placable Bagot as Bishop of Oxford. Nothing could better illustrate a certain innocence in Pusey than his unsuspicious manner of addressing Wilberforce at the very time when that prelate was scoring him in a private letter in the most merciless fashion. But that he was not wanting in courage or persistency is made evident by his first university sermon after his long suspension. He began where he had left off, retracting nothing. It was characteristic that he attributed his suspension to some secret sin. For so good a man his sense of sin was always morbidly acute. One must be far gone in ascetic piety not to be more amused than edified by the chapter which records Pusey's struggle with Keble to get him to confess him and furnish him with a penitential scheme of life. Even Keble, always more rich than Pusey in saving common sense, and not without a little worldly wisdom, cannot repress a smile. One of Pusey's self-denials was to leave his mail for a while unread. Keble confessed that for him that would be self-indulgence. He also suggested that Pusey's resolution not to smile might be harder for others than for himself. As for his stern repression of all humor, that could not have been a difficult penance. His resolve "to drink cold water at dinner as only fit to be where there is not a drop 'to cool this flame,'" is possibly ambiguous, but it is probably meant to reflect upon himself and not on the water. His endeavor to dissociate Keble his confessor from Keble his friend is strange and sad: "If I might ask, do not shake hands, or—anything of this world." But the kindness of his heart came out in his begging Keble not to follow his example, lest the hard bed, and hair shirt, and third-class cars, and the eating of unpleasant food by preference, should be injurious to his health.

Pusey had one penance that was not of his own choosing. He had built the Church of St. Saviour's, Leeds, with his own money as a penitential gift to God. It proved a source of terrible perplexity to him, a nest for Romanizing clergymen, who, hatching all sorts of vagaries, aroused the opposition of their rector and their bishop, and finally, with one exception, went over to Rome in a body. The Gorham controversy drags its slow length through seventy pages. Before this began, Manning had been suspicious of Pusey's sympathy with Newman and had warned him of his fears. But the

Gorham decision that baptism has no magical efficacy for the extirpation of original sin drove Manning and many others into the Roman Church, while apparently Pusey never so much as thought of going with them. His was the patience of hope. He felt sure that in course of time all things would work together for the good of those who believed that every formal declaration of the Roman Church, except that of her primacy, might be accepted by the Anglican without prejudice to his standing in the Church of England. All the anxieties and dangers of the Gorham controversy flared up again in 1853 in the case of Archdeacon Denison, who, condemned by the Diocesan Court of Bath and Wells for preaching the doctrine of the Real Presence of Christ's body in the sacramental bread and wine, successfully appealed to the Court of Arches and the Judicial Committee of the Privy Council, but on purely technical grounds. Keble's caution throughout this controversy is instructive as compared with Pusey's more straightforward conduct. It is interesting to conjecture what their course would have been if the Privy Council had confirmed the judgment of the local court. It is not likely that they would have been driven to Rome. Their instinctive devotion to the Church of England was sufficient to outweigh a hundred logical considerations, and they were always rich in expedients for saving themselves from the practical conclusions involved in their patristric theology.

Pusey's position was one of painful isolation through the whole period covered by this volume of his biography, but the year 1850 was that in which his isolation was the most complete and his burdens greater than seemed possible for him to bear. In this year his bishop condemned not only his special errors, but his general ministry, as doing "more than the labors of an open enemy" to wean Anglican believers from the faith and ritual of their church. An elaborate correspondence ensued, and Pusey was shortly inhibited from preaching in the Oxford diocese. Keble was the only friend from whom he got much comfort. Gladstone advised apology for certain adapted Roman books of devotion, and Pusey's brother held his nose to the episcopal grindstone in a remorseless way, even being so superserviceable as to prepare a form of retraction for him to sign. In the event Pusey's "relentless gentleness" prevailed over Wilberforce's indignant wrath, the inhibition was withdrawn, and in a few years Pusey found himself preaching at St. Mary's on the invitation of his bishop. It would be difficult to exaggerate the debt which Catholic Anglicanism owes to Pusey's patience, meekness, and long-suffering. But it is certainly a question whether he would rejoice very much to see our day, when so much of the Hegelian honey has gone into the Tractarian hive, as Mark Pattison said, and the High Church theologians of Oxford are developing a Biblical criticism from which the writers of 'Essays and Reviews' would have drawn back with suspicion and alarm.

Women's Work. By A. Amy Bulley and Margaret Whitley. With a preface by Lady Dilke. London: Methuen & Co.

THE facts and statistics systematically grouped in the first two chapters of this volume leave no room for doubt that, in England, women have already gained a foothold in the higher professional and business occupations. The Englishwoman's problem, it appears, is now not to get acceptance of her service from a public that understands its value, but to secure in return for it a rate of payment that shall insure her a fit standard of living in her particular walk in life. If she can succeed in obtaining an equal rate of remuneration with men for equal work, her difficulty, it is claimed, will be in a fair way of solution. This statement is, of course, not applicable to the woman of exceptional talent or ability, but to the rank and file of workers, for whom, for an indefinite time to come, the only hope of securing a fixed and fair reward is by coöperation and organization among themselves. Thus, by way of illustration, although Mrs. Humphry Ward is said to have received £18,000 for 'David Grieve,' the earnings of women writers in general are such that the projectors of the "Authors' Club" excluded them on the express ground (endorsed by Mr. Walter Besant) that they could not afford to pay the subscription —the "Writers' Club" for women being the fortunate outcome of this refusal. Again, although a head-mistress may, in London, receive £300 and upwards per annum, the average assistant mistress gets the cramping stipend of £125 to £150, while assistant masters in similar posts get £140 to £170; and further, although "even in the Established Church the propriety of women preaching appears to be regarded to some extent as an open question," and in any case women preachers seldom fail of a congregation, "an item no church can afford to disregard," such preachers have not been found sufficiently worthy of their hire to make quotation of their remuneration possible. In still another field, although an isolated case is cited of a woman having set up for herself in business as a jeweller, the conclusion is that if women wish to gain a footing in artistic crafts that require an apprenticeship, "they must conciliate opposition by showing that they have no intention of underselling their fellow-workmen."

While in the crowded textile and other trades involving employment in factories, women do the same kind of work as men, "and are almost equally skilled," the rate of wages they accept in suicidal competition with men, in combination with their unorganized condition, suffices to turn their presence in the industrial world into a threat against the possibility of a decent standard of life for the British working classes. Low wages and lack of organization are shown to be interdependent conditions—women in the bookbinding trade, for instance, having been declared, like the journalists, unable to pay the subscription to men's associations (their wages seldom being more than half the men's) even should provision be made for their admission. The first step towards overcoming both conditions at once is the formation of temporary trades-unions among women themselves. Already numbers of such unions, dating from the efforts of Mrs. Emma Paterson in 1874, have been formed. The difficulties of organization among the lower grades of workers, rendered spiritless by overwork, fearful of dismissal at the first step towards independence, and ill able to spare from the pittance earned even the small sums needful for organization, are enormous. Nevertheless encouraging results are detailed. In certain cases, as of the cotton-weavers, men unionists have had the foresight to bring women into their own organizations, with the result that wages have become equal, while the fatal element of competition between men and women has been eliminated. A reasoned belief in mixed unions, as the ultimate form, is the natural outgrowth of the principle laid down by Lady Dilke that "the highest interests of women in every sphere of life are indissolubly bound up with those of men, and any attempt to deal with either separately is fraught with danger to the State and to the nation."

A point insisted on, and illustrated by the case of shop assistants, is that it is impossible for outsiders to reform trade abuses; shops which have been forced, by Consumers' Leagues and the like, into providing seats for assistants, having, by systems of fine, reprimand, and dismissal, rendered the seats useless. The only sure means of reforming grievances is pronounced to be combination among workers, backed by judicious legislation. The need for further legislation in regard to sanitary conditions, hours of labor, the employment of children, and of mothers with infants, is set forth at length. The last, however, is the only class of women for whom special legislation is desired, and Lady Dilke notes that whatever sacrifice of personal freedom women may be called on to make, they make ultimately for the sake of their own hearths and their own children. Factory laws are urged on the principle that "trade must adapt itself to what is necessary for the workers in regard to their health and requirements as human beings," not that "human beings must adapt their standard of health and leisure to the conveniences and exigencies of trade."

It is a paradoxical fact that combination among the women of England has been confined to the lower classes of workers. The cultured classes have formed no organization fulfilling the purposes of a trades-union, while the "corporations by which professional and commercial men secure the maintenance of a definite system of employment and a fixed standard of payment have no parallel among workers of the other sex." Whatever may be the causes of the blindness of the more intelligent women to their own interest, this is a volume well adapted to relieve it, since it relies for its force on inference from fact, and is free from both the cant and the mawkishness that sad experience has taught readers to expect from literature designated by the feminine noun.

Hours in My Garden, and Other Nature-Sketches. By Alexander H. Japp, LL.D., F.R.S.E. Macmillan. 8vo, pp. 340. Illustrated.

THE personal impressions, observations, and some results of reading, with which this volume is filled, are very interesting indeed. The work relates to the old country, from Devon to the Tweed, and has more than a hundred sketches, like little windows through the pages, each a delight of the artist, looking out upon the bits of England and Scotland described within: scenes from the gardens, the hedgerows, the wood, the stream with its rapids and its bridges, and the castles with their towers, in ruins or hiding their grayness under the ivy. The birds and the beasts and the people are not just those to which we are accustomed, but they call up our own for comparisons by similar, yet decidedly different, traits and surroundings. The author is one of the most accurate of the natural-history essayists; his idealizations are not too far from the truth for recognition, and his enthusiasm is not intemperate. Of the popular writers there are few who stay so close to the facts; because of this his reader is led to feel more as if actually going over the route to gather in the things worth seeing and remembering. The text is full of life and poetry; apt quotations from favorite poets are abundant, and are used

with good effect. But, with due reverence for Shakspere, Milton, Keats, Campbell, and others, it must be agreed that some of the stock expressions common in popular writing, threadbare as they are, out at elbows or crippled in recital, add little to strength or originality in composition—"Mice and rats and such small deer," "fresh woods and pastures new," "a dim religious light," "a thing of beauty is a joy for ever," "distance lends enchantment," etc.

Quoted observations, like the author's own, are usually weighed with care, which of course contributes much to the attractiveness of the volume. Several of his second-hand notes, such as that on the bird diving to thirty fathoms from the surface, for instance, should perhaps be accepted with allowances. Suggestion of a critical disposition, and readiness in its exercise, appears also in his references. He touches up Burroughs for inability to discriminate between rooks and crows, and again he wrings the heart out of the gushing description of "A hunt for the nightingale" by remarking that it was rather too late for the song, and "it is even very doubtful if that five minutes' song which Mr. Burroughs did hear was, after all, the song of the nightingale, seeing that the song by that time has so many imitators; and it does not appear that Mr. Burroughs saw the bird which gave the short shower of notes he set down as those of the nightingale." While Dr. Japp certainly was wide awake in "Up in the morning early," there is reason to suspect it was much nearer his regular bedtime when he wrote the account of that excursion, since the statement "As we pass on we meet a shepherd driving his charges thus early out to pasture, whistling as he goes, his face shining from hardly yet effaced ablutions," is followed, a little farther along, by "And so we close our morning ramble of fully two hours—not having met or seen a human being." The encounter with the bull, coming after, may have put the shepherd out of mind.

Sea Yarns for Boys, Spun by an Old Salt. By W. J. Henderson. Harper & Brothers. 1895.

A STORY is current in the naval service that, years ago, during the late war, one of the many improvised men-of-war commanded by an officer of the volunteer navy was noted from the fact that over the door of the cabin—a cabin of a man-of-war being judicial chamber as well as quarters—were inscribed the words, "Who enters here leaves hope behind." In the same way 'Sea Yarns for Boys' might have had the phrase "Who enters here leaves fact behind" inscribed upon its covers. This is not meant as a reflection, since the yarns belong in the domain in which Frank Stockton enjoys such peculiar preëminence. The writer, in fact, deserves great credit for his powers of imagination; but in addition praise should be given for his keen observation of the many and varying phases of the sea and its surroundings, and the happy facility he has in describing them. We are quite sure the book will be found amusing and interesting by the boys, and such yarns as "The Long Yacht Race," "The Peaceful Pirates," and the "Queendom of Girlica" not only will amuse older people in their lighter moments, but are especially creditable to the yarn-spinning powers of the author.

Those who have followed the sea many years will recognize, with some exaggeration, the language of the forecastle of the old days—the days of single topsails and long cruises in the merchant service, the days that marked the "sailors" of past years as distinguished from the "seamen" of the present. The author is not unfamiliar with men-of-war either, especially their externals; but he is not, we think, in that respect to the manner born.

BOOKS OF THE WEEK.

Balfour, A. J. The Foundations of Belief. Longmans, Green & Co. $2.
Bassett, George. Hippolyte and Golden-Beak. Harpers. $1.25.
Beale, Maria. Jack o'Doon. Henry Holt & Co. 75 cents.
Besant, Walter. Beyond the Dreams of Avarice. Harpers. $1.50.
Bonner, Hypatia Bradlaugh. Charles Bradlaugh: A Record of his Life and Work. 2 vols. London: Unwin; New York: Putnams. $8.40.
Bosanquet, Bernard. A Companion to Plato's Republic for English Readers. Macmillan. $1.75.
Carruth, Hayden. The Adventures of Jones. Harpers.
Chinaman, J. C. Bright Celestials: The Chinaman at Home and Abroad. London; Unwin; New York: Putnams. $2.40.
Cortina, R. D. French in Twenty Lessons. Book First. R. D. Cortina.
Craddock, Charles E. The Phantoms of the Foot-Bridge, and Other Stories. Harpers. $1.50.
Currie, Frances L. A Breath of Suspicion. F. L. Webb.
Dictionary of Scientific Illustrations and Symbols. W. B. Ketcham.
Dunckley, Henry. Bamford's Passages in the Life of a Radical. 2 vols. London: Unwin; New York: Putnams. $2.80.
Elshemus, Louis M. The Moods of a Soul. Buffalo: C. W. Moulton.
Fowler, W. W. Summer Studies of Birds and Books. Macmillan. $1.75.
Geikie, Sir Archibald. Memoir of Sir Andrew Crombie Ramsay. Macmillan. $4.
Ginnell, Laurence. The Brehon Laws: A Legal Handbook. London: Unwin; New York: Putnams. $2.40.
Good Reading about Many Books. Mostly by their Authors. London: T. Fisher Unwin.
Haliburton, Hugh. Furth in Field: Essays on the Life, Language and Literature of Old Scotland. London: Unwin; New York: Putnams. $2.
Haynes, E. J. A Farm-House Cobweb. Harpers. $1.25.
Howells, W. C. Recollections of Life in Ohio from 1813 to 1840. Cincinnati: Robert Clarke Co. $2.
Johnston, Elizabeth B. George Washington, Day by Day. The Cycle Publishing Co. $2.50.
Kean, Sydney. Both Worlds Barred. London: Unwin; New York: Putnams. $1.40.
Knight, E. F. Rhodesia of To-Day: A Description of the Present Condition and the Prospects of Matabeleland and Mashonaland. Longmans, Green & Co. $1.
Lawrence, Rev. E. A. Modern Missions in the East. Harpers. $1.75.
MacNeill, J. G. W. Titled Corruption: The Sordid Origin of Some Irish Peerages. London: Unwin; New York: Putnams. $1.40.
Magill, Mary T. Pantomimes; or, Wordless Poems. E. S. Werner. $1.25.
Matter, Force and Spirit. Putnams. $1.
Memorial Volume, University of Pennsylvania. Boston: Ginn & Co. $1.10.
Menzies, John. Our Town and Some of its People. London: Unwin; New York: Putnams. $2.40.
Pinto, Prof. William. The Literature of the Georgian Era. Harpers. $1.50.
Nihilism as It Is. London: Unwin; New York: Putnams. $1.40.
Ogle, Arthur. The Marquis D'Argenson: A Study in Criticism. London: Unwin; New York: Putnams. $2.90.
Peck, Prof. H. T., and Arrowsmith, Prof. Robert. Roman Life in Latin Prose and Verse. American Book Co. $1.50.
Robinson, H. P. Men Born Equal. Harpers. $1.25.
Sargent, C. S. The Silva of North America. Vol. VII. Lauraceæ—Jugiandaceæ. Boston: Houghton, Mifflin & Co.
Schelling, Prof. F. E. A Book of Elizabethan Lyrics. Boston: Ginn & Co. $1.25.
Ten Brink, Prof. Bernhard. Five Lectures on Shakspere. Henry Holt & Co. $1.25.
The English Abroad. London: Unwin; New York: Putnams. $1.40.
The Schoolmaster in Comedy and Satire. American Book Co. $1.40.
The Yellow Book. Vol. IV. London: John Lane; Boston: Copeland & Day.
Townsend, E. W. Chimmie Fadden, Major Max, and Other Stories. Lovell, Coryell & Co. 50 cents.
Tucker, Elizabeth S. Famous Queens and Martha Washington Paper Dolls. F. A. Stokes Co.
Twain, Mark. Pudd'nhead Wilson and Those Extraordinary Twins. Hartford: American Publishing Co. $2.50.
Tyler, Prof. Moses C. Three Men of Letters. Putnams. $1.25.
Wagner, Leopold. Manners, Customs and Observances: Their Origin and Signification. Macmillan. $1.75.
Warren, Lillie E. Defective Speech and Deafness. E. S. Werner.
Wise, T. J. Spenser's Faerie Queene. Book I., Part III. With illustrations by Walter Crane. London: George Allen; New York: Macmillan. $3.

HENRY HOLT & CO., N. Y.

HAVE READY:

TEN BRINK'S FIVE LECTURES ON SHAKESPEARE.

Translated by JULIA FRANKLIN. 12mo, gilt top, $1.25.

A HISTORY OF THE NOVEL

PREVIOUS TO THE SEVENTEENTH CENTURY. By Professor F. M. WARREN. 12mo, gilt top, $1.75.

JACK O'DOON.

An American Novel by MARIA BEALE. Second Edition in press. (Uniform with "The Prisoner of Zenda.") 75 cents.

The story of a great sacrifice, with stirring episodes on land and sea. The scene is the coast of North Carolina. The climax is original and impressive.

SLUM STORIES OF LONDON.

(NEIGHBORS OF OURS.) By H. W. NEVINSON. (Uniform with "The Prisoner of Zenda.") 75 cents.

"A book which runs the gamut of human emotions. . . . Didacticism is entirely absent."—*Public Opinion.*

69 Cornhill, Boston.

"BALLADS AND SONGS."

By JOHN DAVIDSON.

Octavo, $1.50.

Grant Allen has written of "The Woman Who Did," and the title suggests that John Davidson may fitly be called "The Man Who Dares," for certainly some of his themes and some of his lines, in this his latest book, are among the most daring in modern literature. One closes Mr. Davidson's book with reluctance and with a haunting sense of beauty and power, and the promise of yet greater things to come. Happily he is not faultless—since for the faultless there is no perspective of hope.—LOUISE CHANDLER MOULTON *in Chap Book.*

"A RANDOM ITINERARY."

By JOHN DAVIDSON.

Octavo, $1.50.

A volume of Essays, with Title-page and Frontispiece by Lawrence Housman.

A captivating little book of English origin, that seems as one reads it to exhale the odors and reflect the hues of the fields and the hedgerows, parks and gardens, through which its author leads us, is John Davidson's "A Random Itinerary."—*Chicago Dial.*

To readers who enjoy whole chapters of minute description of field, forest, and sky, the book may be most cordially recommended, for Mr. Davidson writes with magnetic enthusiasm, and his style is remarkably vivid and agreeable.—*San Francisco Chronicle.*

The Nation.

NEW YORK, THURSDAY, FEBRUARY 28, 1895.

The Week.

THE applications for the new four per cent. United States bonds have been seven times the amount allotted, and they are at a premium of 7 per cent. over the advertised price. When you want to borrow money, it is always wise to go to a place where money is. Secretary Sherman understood this when he was in the business of bond-selling some years ago, as the following cablegram, which he published without any sense of shame, testified:

"LONDON, April 12, 1878.
"Very pleased we have entered into relations again with American Government. Shall do our best to make the business successful.
"ROTHSCHILDS."

There ought to be some little pride left in American credit, even in the Senate of the United States. Somebody ought to have the courage to rise in his place and congratulate the people on the fact that foreign investors, both Jews and Gentiles, are tumbling over each other in their eagerness to get our national bonds, and are paying the gold down "on the nail" for them. Senator Gray ought not to be the only member of that body who is pleased with such proof of our high standing in the money markets of the world. This high standing implies general belief among human beings that the United States will keep its promises, that it has the ability to do so, and the moral sense likewise. A high premium on the bonds is the highest possible compliment to the nation, because it is not open to any suspicion of insincerity. When a man bets his money on the honesty and resources of the United States, there is nothing more to be said in the way of compliment, and the further away the betting is done, the higher the compliment.

We are very glad that the syndicate has made a good bargain. Whatever profit has been made has been due to the exertions of the syndicate themselves. They deserve it all, and the thanks of the American people besides. President Cleveland is likewise entitled to more than thanks. He has earned the highest praise. On this point Mr. F. H. Peabody writes a letter to the Boston *Transcript*, saying that "the one man in the United States who has done more than any other to protect its finances and strengthen its credit is President Cleveland." Then, with an eye evidently on Senator Lodge and Congressman Walker, he adds: "The men who have impoverished its Treasury and tainted its credit are the very Congressmen of both parties who are now abusing Mr. Cleveland, and it is worth while for New Englanders to remember that some of their prominent Republican representatives, who are now vociferous in condemnation of Mr. Cleveland, have themselves assisted by their votes in the unfortunate work."

There are wreckers and wreckers, but Senator Mills is anxious to pose as the chief of them all. The amendment to the sundry civil appropriation bill which he introduced on Saturday entitles him to dishonorable distinction among them. It reads: "And all laws which authorize the secretary of the treasury to sell the bonds of the United States for any purpose are hereby repealed." This would not only prevent action to preserve the national credit in an emergency, but would sweep away all provision for redeeming the greenbacks, and land us at once in the slough of depreciated currency and repudiation. But it is needless to say what it would do. It was not introduced for the purpose of being passed, but for the purpose of showing the country the kind of finances Senator Mills believes in. He evidently craves the title of wrecker-in-chief, and, for our part, we accord it to him without any hesitation whatever.

The suppression of the silver bill of Senator Jones of Arkansas was due in part to the fact that the bill could not be passed at this session of Congress, although it might bring all other public business to a standstill, and in part to the fact that it did not provide for free coinage. The latter term implies the reception of silver from private persons and the coinage of the same into dollars for their account at the ratio of 16 to 1 with gold. The Jones bill provided that the Government should receive silver from private persons at its market value in gold, and coin it so that the Government should receive a little more than one-half of the resulting coins. At the present price of silver the bullion value of the dollar is only 46 cents. Under the operation of the bill the Government would receive from a private person, say, 4,125 grains of standard silver, coin it into $10, hand $4.60 to the depositor of the silver, and retain $5.40. Of course, this does not give any extra profit to the owners of silver mines, although it may "steady the market" for them. On the other hand, it recognizes and sanctions the inferiority of silver as a money metal, and hence is not satisfactory to philosophers of the Bland school. The Jones bill contains all the virus of the Sherman act, which the Senate voted by 11 majority to repeal about eighteen months ago, but it is not what is understood by free coinage.

The House rejected on Monday the clause for paying the Bering Sea claims agreed upon by the President in lieu of sending the whole lot before a commission to be umpired by some foreign power. This was mainly the work of the Republicans, but they were reinforced as usual by a sufficient number of the other side to spoil the broth for the Democratic party as a whole. The ground on which the award was rejected was that more than half of the claimants were American citizens masquerading as British subjects and entitled to no damages in any case. This we have always supposed to be true, but we did not suppose that it was our interest to proclaim to the world that five-ninths of the "poachers" against whom we have been screaming and growing black in the face these many years are Americans. When a similar alternative was offered to Great Britain after the Geneva Tribunal had passed judgment on the *Alabama* claims, she elected to pay the lump sum of $15,000,000; and did pay it without grumbling. There is a surplus of more than $425,000 of that money in our Treasury to-day. We hoped to be spared the humiliation of seeing this claim repudiated. In our domestic relations we may commit any folly, such as throwing $16,000,000 over our shoulder in the matter of a bond sale, or a still larger sum in a Pacific Railroad bill. All this is endurable because it affects only ourselves. Not so an international claim, which affects our standing before the world. As the Jingo spirit which resists the payment of this money is chiefly among the Republicans, it is well to remind them that the Paris Tribunal was the work of the Harrison Administration from beginning to end, that the Cleveland Administration did nothing except receive the verdict and fix the amount to be paid under the damage clause.

That the naval-appropriation bill now pending in the Senate is an extravagant one, even its champions are forced to admit. It carries a total of $31,807,000, as against $25,366,000 a year ago, and $22,104,000 two years ago. It even exceeds the secretary's estimates by nearly $1,000,000—a thing almost unprecedented in appropriation bills. The efforts of the friends of the bill to explain away their lavish appropriations are ingenious if not convincing. You see they were forced to economize last year unduly, owing to the ignorant prejudices of voters about the Government's being extravagant when private citizens were severely cramped; this year it seems safe to ignore those prejudices and hang the expense. Then, too, there are some pretty heavy bills falling due for material and armor and guns ordered by other Congresses. It is "only common honesty" to pay these, but we shall even matters up by authorizing expenses of some $13,000,000 for new battle-ships which not this

but some future Congress will have to pay. This will balance things nicely, and besides enable us to go on the stump and deny that we have saddled the taxpayers with a needless expense. We can deny, and point to the bill to prove it, that we have appropriated a cent for new battleships. The fact that the bills will have to be paid later will not weigh with fair-minded taxpayers, who will reflect that they may all be dead before pay-day comes round.

Congressman McCreary of the foreign-affairs committee put the question of a Government expenditure of $3,000,000 for a cable to Hawaii in its true light when he said that it was a movement to reverse the nation's policy as to the undertaking of large commercial enterprises, without any assignable reason for doing so. These islands are not on any direct line to any other place, being 2,000 miles south of the direct line to Japan and China, and 500 miles north of the direct line to Australia. As to the claim that the cable would be a great advantage in war, he said that any power strong enough to fight us in the Pacific could easily cut the cable. Moreover, the only thing the cable could do if it were not cut would be to send early news *to* the Hawaiians. News *from* that country during a war with any European power would be of very slight interest or advantage. Mr. McCreary hoped that "all submarine cables will have time to wear out before we have another war." But if a cable is wanted for commercial purposes there was a responsible company prepared to construct one, not merely to the Hawaiian Islands, but to Japan also, and this company asked nothing but an act of incorporation from Congress and the necessary authority to go to work.

By way of showing the importance of a cable, Mr. Boutelle asked Mr. McCreary the question:

> "Now will the gentleman be kind enough to indicate any other port on the globe with which we had *so much commerce* during the last fiscal year as we had with the port of Honolulu?"

Mr. McCreary ventured to name Liverpool and Southampton. Then Boutelle in his agile way said that he meant not commerce exactly, but arrivals and clearances of American vessels, and he proceeded to read a list of such arrivals and clearances showing that only two American ships visited Hamburg last year (or perhaps one such ship visited Hamburg twice), while there were 165 arrivals and departures of American ships from Honolulu. This means that there is an American line of steamers between San Francisco and Honolulu, and that they make regular voyages back and forth, and that a few whalers touch there also. This was what Boutelle attempted to palm off upon the House as a greater commerce than that of the United States with Liverpool, or London, or Hamburg, or Havre.

We felt certain that when we saw the Hawaiian account of J. Cranstoun, the American who was deported from Honolulu, we should get a very different view of his character from the one he himself takes. He said he did not know and was not told either why he was arrested or why he was deported. But the *Hawaiian Gazette* of February 5 makes all plain. It appears that Cranstoun "had been assigned and accepted the undertaking of throwing dynamite bombs into the Central Union Church during services on the Sunday evening the outbreak was scheduled." These, we suppose, were those deadly cocoanut bombs found in the ex-Queen's cellar. The *Gazette* does not say how it knows this, but the story bears all the marks of truth on its face. It is the well-known practice of royalist conspirators to begin operations by killing a lot of women and children in a church. But the *Gazette* adds another charge, if possible more damning: "Cranstoun is the party who was responsible for the split in the rank and file of the Schützen Club." This is enough. Any man who, in addition to readiness to throw bombs into a church, would deliberately go to work to split up the rank and file of a Schützen Club, is no longer fit to breathe the pure air of Hawaii. But is not deportation for such a man dangerous leniency? Will it not encourage bomb-throwing in church—a practice obviously most dangerous to a missionary republic? We think he should have been decapitated. The Hawaiians should understand that the eyes of patriots in this country are upon them in this crisis, and that the hope is universal here that the Missionaries' Sons will not let a single man or woman whom they have robbed of land and power now escape with life.

Senator Vest ought to run home as fast as possible and prevent the Missouri Legislature from passing a bill to make the proposed Kansas City water-works loan payable in gold. We believe that Mr. Vest hails from Kansas City, and is therefore in a double sense interested in preventing this outrage upon silver. Kansas City has been, for some time past, endeavoring to sell $3,000,000 of gold bonds to improve her water supply, but she has met the objection that there is no specific authority in law to make the bonds payable in gold. Hence the city is promoting a bill before the present Legislature, which has passed the Senate, and will without doubt pass the House. The second section of this bill contains the provision that the principal and interest of these bonds shall be "payable at such place in the United States and in such lawful money of the United States as may be specified by the ordinance directing their issue, and in the bonds." This will cure the only defect in the bonds and will enable the city to get the money at once. But the indignity put upon silver will be simply monstrous. It will be every whit as bad as that inflicted upon it by Idaho, Arizona, and Alabama in their recent laws authorizing gold loans and gold contracts, and by Senator Stewart in his gold mortgages. We assume that Congressman Bland is already at home and in the breach, and that Senator Vest will not be far behind him.

The passage, by both houses of the New York Legislature, of a bill forbidding the display of any flag save the American upon the city hall or other public building, except as a courtesy to a distinguished foreign guest, is a victory for simple sanity in politics. It is aimed, of course, at the display of the Irish flag on St. Patrick's day, for no controversy has ever arisen in reference to such use of any other flag. Mayor Hewitt's refusal to allow its display during his term is thought to have been one of the most powerful of the influences which caused his defeat for re-election. The Irish themselves ought to rejoice over the passage of the bill, for it will relieve them of the invidious distinction of being the most childish of all our bodies of foreign-born voters. The assumption that they would vote in a mass to "down" any mayor who refused to unfurl the Irish flag from the city hall on the day of their patron saint, which has been at the bottom of all the hubbub, was due rather to the eagerness of political blatherskites to catch the Irish votes than to the real wishes of the Irish voters themselves.

The situation at Albany is a very clear one now. Platt's hold upon the Legislature is badly broken, but not destroyed. He will still be able to block the progress of reform measures and possibly to defeat them provided public pressure in their support be withdrawn; but if that pressure be continued, the Legislature will not venture to do his bidding. He is pretending that he has had an entirely satisfactory talk with the Governor, as he pretended formerly that he had a satisfactory understanding with Mayor Strong, but there is no foundation for it. He is merely paving the way for another "breach of faith" later when he is forced to explain to his followers the failure of the Governor to comply with his desires. His only hope is that popular interest in reform measures may flag, and that in this way he may induce the Legislature to delay and finally defeat them. This will prove a delusion like all his other hopes. He assured the three Republican police justices who are on the bench with twelve Tammany justices, when he returned to the city last week, that they would not be disturbed, since the bill abolishing that bench and creating a city magistrates' bench would never become a law; but he will not be able to defeat that bill. The moment that the people of this city be-

come convinced that this and other reform bills are being "held up," from that moment there will arise such an imperative demand for their passage that the Legislature will be forced to obey it. There will be no room for doubt on this point.

On the death of Sir John Seeley, professor of modern history at the University of Cambridge, a report arose that the chair would be offered to Capt. Mahan. One of our contemporaries dwelt on this report with much satisfaction, although with the trifling inaccuracy of calling Cambridge University by the name of Oxford. It would have been, indeed, an excellent appointment. Capt. Mahan would soon have taught the youth of Britain on what flimsy foundations her empire would be resting the moment a true American patriotism should have created a proper fleet, wherewith to occupy Hawaii, overawe Samoa, watch New Zealand, and convert the Pacific into an American lake. But it was hardly to be supposed that the insular conceit, to say nothing of the dark malignity, of England, would give her young men any such golden opportunity to hear the truth. Far otherwise, indeed. Lord Rosebery's Government (for the English crown is astute enough to keep the appointments to the history professorships in its own hands) has conferred the appointment on Lord Acton, a Roman Catholic. It will be clear to every American that the titled aristocracy have it all their way in the old country. Free thought has no chance to expand itself under the blighting upas-tree of a coronet.

There is in the London *Sunday Times* a very amusing interview with Mr. Henry D. McNiel, the secretary of the English Bimetallic League. He is described as a very serious person, with a deep sense of the immense responsibility of his rôle. He showed in the first place that "the masses" are all for bimetallism. Then he defined bimetallism as "the use of gold and silver as a joint standard of value." He was then asked what would be the ratio between the two metals, and he answered that "this was a detail that must be left for settlement by the nations concerned." He was right in treating it as a mere "detail," because if the nations concerned can "settle" it by agreement, they can take any ratio they please—15 to 1 or 30 to 1—without regard to the market value of bullion. In like manner they can fix the value of any commodity by offering to take it at a certain price in Government storehouses or "sub-treasuries." Being asked how the ratio between gold and silver could affect the 99 per cent. of all commercial transactions now conducted by means of credit, he said:

"The answer to that is simple. All transactions would be based on legal tender, and would be expressed in pounds sterling. All credits would be governed under the new system, as they are now, by the legal tender, though we may continue to think in gold. Mr. McLeod is wrong in supposing credits will be uninfluenced when silver is also legal tender."

His notion evidently is that in commercial transactions some merchants would "think in gold" and others would "think in silver," and the gold thinker, when he came to settle up, would let the silver thinker send him his balance in a cart under the legal ratio. The convenience of having both think in the same metal does not seem to occur to Mr. McNiel, or the absurdity of thinking in two metals if it is just as convenient to think in one.

At the last moment the Tories took fright at their own programme, and refrained from beating the ministry on Thursday as they undoubtedly might have done. They would have no scruples about turning Rosebery out on a tricky motion like Sir Henry James's, but what alarmed them was the prospect of a dissolution and going to the country on an issue which really involved injustice to India and bimetallism. Even Lord Salisbury, with his genius for "blazing indiscretions," even Mr. Balfour, with the Manchester bimetallists egging him on, shrank from testing the opinion of the country on those questions. So they concluded that the shrewd party tactics of Sir Henry were too clever by half, and left him to overwhelming and ignominious defeat. The rapid growth of the cotton manufacture in India for some years past, which very much resembles its growth in our Southern States, has been somewhat impeded by both internal taxation and Manchester competition. English cotton goods coming in duty free, the Indian Government two years ago, in compliance with loud native remonstrances, put as much duty on foreign (including English) cottons as would counterbalance the internal taxes to which the industry is exposed. Against this the English manufacturers of Yorkshire and Lancashire have been kicking heavily. The fall in the Indian silver had already converted Manchester to furious bimetallism.

The great round-up of enterprising French editors last week, for the purpose of receiving sentences of imprisonment and fine as blackmailers, ought to furnish a solemn warning to their brethren of the craft on this side the Atlantic. It is true that American journalism has not yet descended to such depths of infamy as have long been synonymous with the newspaper world of France. Our writing bravos are not so openly for hire as theirs, our defamers and blackmailers have not yet brought their art to such perfection, or given it such a range. But if things go on with us as they have been going, we shall not be able much longer to thank God that we are not as those wicked French editors. Our newspaper rage for publicity, our hounding of public men, our invasion of private life, must soon either be bought off, as in France, or shut off by law. To what extent bribery, direct or indirect, already controls the mighty engine of the press, as Mr. Pott of the Eatanswill *Gazette* called it, the outside public, which does not happen to be blackmailed or to want to buy favorable notice, is unaware. The surest remedy is in rigorous laws of libel and their rigorous enforcement. The defeat of the attempt to relax the libel laws of this State last winter was a distinct gain for public morality. In the same interest is the bill just introduced in the Connecticut Legislature by Senator Hall, making it illegal "to publish a description of any social or family gathering in a private house without the consent of the host or hostess, or to publish a will or inventory of an estate without the consent of the executor or the administrator, or to publish the portrait of any individual without his consent, or, if dead, the consent of his representatives."

That Spain is seriously troubled over Cuban affairs may safely be inferred from her pursuing at the same moment the policy of concession and the policy of repression. Tuesday's news told us of actual and threatened outbreaks in the island, and of authority given the Governor-General to declare martial law. Yet it was only on February 15 that the Spanish Congress passed an act according to Cuba a large measure of home rule. This was the fruit of long agitation and negotiation, and was finally voted almost unanimously, only two obstinate Deputies, both Cuban, standing out against the majority, which numbered 245. Its principal feature is the establishment of a Council of Administration for Cuba, composed of thirty members. Fifteen are to be appointed on royal nomination, and fifteen elected by the voters who elect Deputies to the Cortes; the latter, however, must have pretty stringent property and educational qualifications. Within the control of this Council are to be placed many important matters of local government—public works, the posts and telegraphs, laws respecting agriculture and commerce, public instruction and hygiene. True, the Governor-General has a positive veto on any act of the Councils which he "may deem contrary to the laws or to the general interest of the nation"; which looks like giving the form of home rule without the substance. Yet the plan was accepted in the Cortes with a great deal of effusion by all the Cuban Deputies except two, and was thought to promise an era of better feeling between Cuba and the mother country and to be a beginning of constitutional self-government in the island. The irreconcilables, however, appear unwilling to accept anything except absolute independence. But to resist this to her last man and dollar, Spain is pledged by the voice of all her political parties and leaders.

THE BOND SALE.

CERTAIN brutal newspapers have joined forces with a brutish Congress to cast discredit on the Administration because the recent sale of bonds has yielded a profit to the syndicate instead of a loss, as the two previous bond sales had done. Nothing more discreditable to the intelligence of the nation has ever been seen than these appeals to personal envy and party malignancy. Every day we find some new evidence of the deterioration and baleful influence of the newspapers, which is prevented from being utterly destructive to the Government only by the fact that they jump from one side to the other of all public questions so rapidly that not even the fools can keep pace with them. It would be a mistake to suppose that they have any other motive than the sale of a few extra copies. One sensation is as good as another for this purpose. Bloody murders, elopements, rapes, divorces, and bond sales all come to the same thing.

The Boston *Herald*, we regret to see, has joined the blatherskite press in denouncing the Government, and seeks to excuse itself by saying that "the outcry against the contract is based entirely upon the point that the transaction showed an enormous profit to the syndicate at the very moment it was made." Yes. Overlooking for a moment the fact that what the Government wanted and must have immediately was *gold*, and not its own promissory notes, of which it already had about $90,000,000 lying idle in its vaults, why does not the Boston *Herald* allude to the other fact that President Cleveland had negotiated this very loan at 3 per cent. on the condition that Congress should pronounce the word "gold" in connection with the loan? And why did not the brutish Congress pronounce that word, and thus save the country sixteen million dollars in interest? Because, forsooth, the bonds were payable in gold anyhow! So some of the leading critics of the loan say. Who knows but that the judgment of these smart Congressmen and newspapers, so loudly proclaimed and so widely advertised, caused the very premium which they are now blathering about? This is certainly worthy of their attention. Let us put it to them in a way that they can understand. The President makes two bargains for the purchase of $65,000,000 of gold coin, to be paid for with bonds. Under one of these bargains the interest is to be 3 per cent., on condition that the interest and principal shall be paid specifically in gold. Under the other the interest is 3¾ per cent. if the interest is to be paid in coin, without mentioning any particular kind of coin. The saving of interest under the former will be $16,000,000 for the time the bonds have to run. "Which will you have?" says the President. "The second one," says the brutish Congress, "*because the bonds are payable in gold anyhow.*" "Oh," says the investing public, "we didn't know that. If that is what you mean, we will give 8 per cent. more for the bonds than we had intended to." We should like to have the brutal press give some attention to this phase of the question. We understand that the Rothschilds are somewhat chagrined that they did not put the price of the bonds high enough to catch more of the cream. It is evident that they underestimated the force and popularity of the argument that the bonds are payable in gold anyhow.

Another thing that the Boston *Herald* overlooks is the value of time in the recent transaction. As Assistant Secretary Curtis said in his remarks on Saturday evening, there was a "run" on the Treasury, just like a run on a bank. When things come and go in a hurry, we are apt to forget them in a hurry. The fact is, that unless the bank presidents of New York had refused to meet the demands of their customers to open gold accounts and to draw gold from the Treasury, the whole remaining $42,000,000 would have been drawn out before Saturday night. That is not all. The reserve would have been swept away, just the same, in spite of the refusal of the banks to coöperate in the run, if the news had not been promulgated that another loan was on foot and that it was a foreign loan. This caused a drop in the rate of sterling exchange. There was no more buying of sterling for speculation or in anticipation of future wants. The run was over, but we were within forty-eight hours of a suspension of specie payments. Suspension would have been an act of bankruptcy. It is vastly more difficult to pick up a bankrupt firm or Government and put it on its feet again than it is to prevent it from falling. Moreover, national pride ought to cut some figure in the case. The spectacle of a great rich country, not menaced with war, not obliged to keep a standing army—a country that has paid off nearly two thousand millions of debt in twenty-five years—stumbling into the quagmire of bankruptcy in a time of absolute tranquillity, would have been too humiliating. Yet we were within forty-eight hours of making that exhibition of ourselves.

The Philadelphia *Press* says that Secretary Sherman made *his* contract with the Rothschilds only "after an open issue of bonds had failed." It argues that Mr. Carlisle should have followed that course, and avoided this fearful scandal of seeing Government bonds improve in price. Of course, while Mr. Carlisle was waiting for his open issue to fail, the Government would have failed, too, but that would have been nothing compared to the crime of not doing as Sherman did. But what did Sherman do? Nothing like what the *Press* says. If it had read the various contracts, it would have known better than to say it. The contract of August 24, 1876, gave the hated foreigners the "exclusive right" to the remainder of the bonds. On May 11, 1877, that contract was modified so as to expire on July 1 of the same year, but with the further stipulation that, "during the continuance of this contract, *any sales of bonds* ordered by the secretary of the treasury, by authority of law, shall be made through the parties of the second part." What room did this leave for an open issue? Before the expiration of this monopoly, namely, on June 9, 1877, a new contract was made with the same parties, giving them a further "exclusive right." Probably what the *Press* is muddled over is the fact that this contract contained a clause providing that the syndicate should offer "the people of the United States, at par and accrued interest, in coin the 4 per cent. registered consols . . . *for a period of thirty days.*" This is the *Press's* "open issue," made after the contract, not before it, with everything left in the hands of a foreign syndicate!

Sherman's indiscreet friends should learn from his own silence that there is nothing to be gained for him or scored against Cleveland by raking up the records of those years. In fact, if Carlisle requires an awful warning as to the kind of letters he ought not to write, he will find it in the Sherman correspondence. Only two days, for example, after the execution of the contract last mentioned, Mr. Sherman wrote to a firm of New York bankers that he "would greatly have preferred" to offer bonds to them "and other prominent banks and bankers," but that it was "impracticable." The Shylocks, in other words, had the honorable secretary down. On July 23, 1877, he wrote to Messrs. Belmont speaking of "discontent at the advanced rates at which you hold the bonds, and some complaints that reasonable facilities were not given for the subscription of bonds during the thirty days." On September 22, in the same year, he wrote to his London agent that the syndicate had not met his "expectations in maintaining the price of the four per cents at par in coin. It looked as if this had been permitted with a view to their purchasing up weak holdings at a discount." The shameless foreigners! And the humiliated secretary! We forbear to quote other letters of his which show that he was as uneasy in those days as he is now over bankers making more than a "reasonable profit" out of the Government. But it may be as well here to record his confession, made to President Hayes on April 9, 1878, that the contract he was about to close, again with the dreadful foreigners, for $100,000,000 4½ per cent. bonds, put the price at a figure "below what I regarded as the minimum rate when I conversed with you, and somewhat *below the actual quotations for these bonds in the market.*" On the whole, the Sherman glass house does not seem to be a good base of supplies for this cruel war.

NON-PARTISAN COMMISSIONS.

THERE was perhaps some color of equity in the theory of non-partisan commissions when it was first brought forward. The public were assured, and to some extent believed, that in this way the evils of excessive partisanship would be modified. The passions and prejudices aroused in political strife, it was supposed, were to subside and be mollified when the contestants were brought face to face, and compelled to arrange some *modus vivendi*. Compromise, which is the distinguishing feature, if not the great merit, of party government, would necessarily determine the action of such commissions, and partisanship itself was to lose half its evil in losing all its grossness.

This theory was quickly exploded by the test of experience. It was found that such commissions failed to improve the character of the Government's service, while it became impossible to fix the responsibility for maladministration. It is not easy to do this in the case of any board of commissioners, but when such a board consists of men identified with one party, the people can hold that party responsible for its servants and creatures, and inflict punishment, after the rude manner in which alone the people can come at its rulers, by a general defeat of office-holders at the polls. But with a non-partisan commission, it was presently discovered, this method of punishment was taken away from the people. No matter how gross the corruption or mismanagement of such a commission, no rebuke to it was possible by the defeat of one party, since, as a rule, this merely implies the success of the other. The non-partisan commission, therefore, furnished such a wall of salvation to the politicians as enabled them to smile serenely at all their foes, and grew as rapidly in favor with them as it declined with the community. It is proof against all attack except in the rare cases when a third party or independent movement succeeds; and for aught that we can tell, had Tammany Hall been wise enough to keep the Police Commission non-partisan, there might have been no investigation and no revolution.

These objections to this mode of filling office have now come to be so well understood that it is unnecessary to dwell upon them. But there are others which may be regarded as even more serious. For, rightly considered, the theory of non-partisan, or more properly bi-partisan, office-holding implies the disfranchisement of those citizens who are not identified with either of the party organizations. Statutes constituting these commissions sometimes prescribe that not more than a certain number of the commissioners shall belong to one party, but they are also drawn so as to require all the commissioners to belong to one party or the other. In such case it is evident that no citizen unconnected with party can obtain the office, and independent voters and third-party men are thus disfranchised.

In view of the recent elections this disfranchisement may affect a very large class. The expression "belonging to a party" is a very loose one. Great numbers of voters appear, in one sense of the word, to have belonged to one party two years ago and to belong now to the other. Two years from now they may change their party again. Many citizens vote for the candidates of a party upon a particular occasion, without claiming or admitting that they belong to that party. But the very difficulty of defining party membership tends to increase the power of the politicians. They constitute the party organization, and they can include and exclude whom they choose. Hence, in the effort to attain a definition of party membership, we see that adherence to particular principles of government is not a test in popular usage, while submission to the orders of those who form themselves into an organization to which they give a party name is such a test. As is true of names in general, a thing is what it is commonly called. A Republican or a Democrat is a man who calls himself and is called of others by that name. In other words, no one is a member of a political party who is not admitted to be such by the majority of those who claim to be of that party. No independent voter can be a member of an organization of which he repudiates the authority, or hold a party name unless he and those who act with him control the organization of that party.

Undoubtedly there are those who believe, as there certainly are many who proclaim, that it is the duty of every good citizen to belong to a party, to "attend the primaries," etc. However this may be, it is reasonable to suppose that if the real aim of the non-partisan theory is to diminish partisanship, that aim would be best attained by the appointment of men who have no party connection. The functions of the non-partisan commission are evidently semi-judicial in character, and when men refer a disputed matter to an arbitrator they naturally select one who has not shown himself prejudiced on either side. But it is idle to speculate concerning such superhuman consistency as this, and if the politicians will refrain from attempting to prohibit citizens not of their class from holding office, we need not ask of them any self-denying ordinance.

But it cannot for a moment be admitted that abstention from party allegiance establishes the slightest presumption of unfitness for administering office. The recent election in the city of New York gave the lie to this assertion. The great reform which was inaugurated was made possible only by the patriotism of large numbers of citizens who repudiated all party claims. To maintain that all such citizens disqualified themselves for holding office is preposterous. It is impossible to deny that outrageous corruption existed in the administration of the city goverment, and it is equally impossible to deny that this corruption could be checked only by independent action on the part of voters. Submission to orders and unquestioning obedience may be military, but are not civic, virtues. It stands to reason that the citizen who conscientiously endeavors to secure good government is more valuable to the community than he who contents himself with voting for the candidates presented to him by party leaders. It is very easy to do the latter, and very laborious and trying to do the former. But if there were not citizens who preferred their country to their party, we should be in a bad way, and the fact that the theory of non-partisan commissions prohibits such citizens from holding office is its sufficient condemnation.

"THE NEW CRITICISM."

WE do not mean by this title Biblical criticism, whether higher or lower; we refer, rather, to the distinctly profane walks of literature. "The New Log-Rolling" is an alternative name for it. It is the name given it by a writer in the *Westminster Gazette* who signs himself "Philistine," and who brought upon himself a perfect avalanche of exasperated rejoinders from outraged poets and essayists by denying the probability that 1894 had witnessed a sudden outburst of genius in England "such as few decades in the history of our country have surpassed." Pushing scepticism to an extreme, he actually demanded better evidence that Jones's volume of verse would enjoy a deathless immortality than the mere assertion of Brown that such would be the case; Brown's infallibility as a critic being in the meantime vouched for by Jones, who declares that he has always found Brown's critical judgments marked by sure insight and impartiality. This scepticism is not original with "Philistine," however. It first appeared, if we rightly remember, in the *Athenæum's* review of English literature for 1893, of which it said the most marked feature was the touching unanimity and enthusiasm with which six or eight new geniuses had discovered each other.

The defence of the geniuses is frank confession. Mr. Richard Le Gallienne, under his own signature, and others, under assumed names, write to the *Gazette* to admit that they do review each other's books and let each other know it; that many fast friendships have been formed through courtesies of that sort, and that people who object to such critical log-rolling belong to the class of "literary homicides whose howls of torment will be the only clarions of their fame." After this cry of honest indignation, they revert to general principles. The new criticism is based on the great truth that it is better to "overpraise than meanly belittle" (of course, the critic has to do one or the other). It is urbane, genial, long-suffering, preferring to flatter ten

undoubted fools than to discourage one possible Keats. It aims to develop a wall-eye for glaring defects and a keen nose for hidden merits. Its favorite syllogism is: All great writers have been belittled; therefore, all belittled writers will be great.

If this were purely a British literary phenomenon, we should not feel called on to comment upon it in our intensely American columns. But the new copyright law has not kept it from our shores any more than it has kept away those disgusting British novels which sell so scandalously. It may be that the American literary log-roller does not ply his art so unblushingly as his English brother, but that he plies it no ordinarily attentive observer of critical methods in vogue can doubt. The game which those who are at it think so deep, though it is really so transparent, is played in this way. Mr. Gifted Hopkins brings out a volume of 'Echoes of Apollo's Lute.' Speedily there appears a review in the journal of which Mr. Macaulay Tupper is the editor, informing an astonished world that the successor of Tennyson, Browning, and Lowell has been found. But the poetic Hopkins has also his critical journal, and in it, within two weeks, appears a notice of Macaulay Tupper's 'The Soul of the Centuries,' in which the reviewer reins himself in from saying what he really thinks about these masterly essays, lest it might look like disloyalty to the memory of Lamb, Sainte-Beuve, and Schlegel. Tupper's paper chivalrously ripostes the week following by saying that Hopkins's organ of opinion had always seemed to it a model, but that of late it had been particularly strong. Of course, the demand for this sort of thing soon creates journals specially devoted to "Literary Gossip," in which the great men write of themselves and each other with immense appreciation and complacence.

Now, there are those whom these antics fill with deep disgust. They think it a phenomenon at which the judicious should grieve, and grieve only. The ancient and honorable calling of the critic they believe to be degraded by these professors of the new art of criticism. They would like, as against the new criticism, a fresh assertion of the old criticism, which feels its responsibility to the public and to truth, and which refuses to write book reviews on charity-organization principles. But the case does not seem to us so serious as that. The affair is not so much one to make the judicious grieve as to make them laugh. What the new critics most need is such treatment as Archbishop Tait proposed for a clerical correspondent of his who suggested some improvements in the Lord's Prayer. "Tell the man," he said to his private secretary, "tell the man that he is a consummate ass, but do it kindly." The kindest service any one can do the new critics is to tell them that their log-rolling is both perfectly understood and perfectly ineffective.

It arises, principally, from their seeing too much of each other. It is worse than provincial—it smacks of the back-yard and the village store. The exact prototype and truest exemplar of the new criticism is to be found, in fact, in the village newspaper. There no squash is raised which is not of phenomenal size and sure to take first prize at the county fair; no trotter is mentioned which cannot force any of 'em to take the dust; no Fourth of July oration which does not imperil Webster's fame; no sermon which does not deeply impress an unusually large congregation. The reason is, that the editor knows he must meet every day the owners of the squash and the trotter, the orator and the preacher; and how could he face them if he had said the squash was but a spindling growth, the trotter knock-kneed, the oration fustian, and the sermon mortal dull? So it is with our new critics. Their mutual admiration grows out of, and is exaggerated by, their too intimate intercourse. How can you say unpleasant things of a man who claps you on the back twice a week at the Admirable Crichton Club and says, "Old man, that essay, poem, speech, review of yours was the greatest thing you've done yet"? What the new critics need most of all is to cultivate the silences and the solitudes. Then, if any of them is called upon to do a bit of that very newest style of the new criticism—a "conversation" with some great man—he need not feel compelled to close by saying: "I felt that I had spent an hour with a strong and virile intelligence, whose best work the world may yet expect," but may safely say, if he will, "I found the interview a good deal of a bore, and think the man has pretty clearly exhausted his vein."

If the new criticism had the practical effect of selling one additional copy, or making a cold world accept its token-money of fame at even 50 per cent. discount, it would lack something of being supremely ludicrous. But log-rolled greatness is unknown outside the circle of log-rollers. It leaves its happy recipients, like Amos Barton, with the conviction, but without the sensation, that they are great men. With so many kind friends telling a writer that he is a genius, he gets to wonder why he does not feel like one. What horrid doubts must sometimes assail a company of the new critics! There sits the best novelist since Scott, here the poet that makes Tennyson's bays green with envy, yonder the acutest critic of a dying century; it must be so, because they have all said it of each other in cold and veracious type. But the strain even on their own credulity must, on occasion, become too great, and a spirit of contrition and confession seize them all, moving them to say —though they never do say it—"Brothers, we are all poor sinners, doing our little daily stints as best we may, but only mortal, only very fallible; and the best resolve we can make is, not to insult the august shades of the mighty dead by mentioning their names in the same breath with our own."

ARGON.

THE announcement of the probable existence of a new element in the atmosphere, made by Lord Rayleigh and Professor Ramsay at the meeting of the British Association last summer, aroused the profound attention of the scientific world. A number of elements have been discovered in the last quarter of a century, but all of them are metallic substances which occur in minute quantities in rare minerals. The latest addition to the list of non-metallic elements was bromin, discovered nearly seventy years ago, and the existence of an undiscovered element belonging to this group did not appear probable. Still less likely did it seem that such an element could be present in the atmosphere. Our knowledge of the air was satisfactory and complete. Innumerable analyses had established the facts in regard to its composition. Hence the announcement above referred to was met with much scepticism, in spite of the eminent character and skill of the men who made it; and the whole chemical world has waited anxiously and impatiently for a full account of the work. This has now been given in a paper by Lord Rayleigh and Professor Ramsay which was read before the Royal Society at a special meeting on January 31. The long delay between the preliminary announcement and the presentation of the paper is fully accounted for by this statement of Lord Rayleigh's:

"The research has been in many respects a very difficult one. I am not without experience of experimental difficulties, but certainly I have never encountered them in anything like so severe and aggravating a form as in this investigation. Every experiment that one attempts, takes about ten days or a fortnight to carry out to any definite conclusion, and the result has been of necessity much less progress than we could have hoped for, and many of the questions have been left open which we could have wished to settle."

The history of the discovery is in brief as follows: In the course of a series of determinations of the densities of some of the more permanent gases, Lord Rayleigh found in the case of nitrogen that if obtained from chemical compounds it was about one-half per cent. lighter than if extracted from the atmosphere. This discrepancy was naturally thought at first to be due to contamination with impurities consisting of known substances. When experiment had demonstrated that this was not the case, the dissociation of the molecules of the nitrogen derived from chemical sources into detached atoms suggested itself as a possible explanation of its greater lightness. But both gases subjected to the action of the silent electric discharge retained their densities unchanged. This was discouraging, and a further experiment of a different kind disposed of this explanation in a still more decisive manner. It was exceedingly improbable that the nitrogen of chemical origin could be a mixture, as that would necessitate the existence of two kinds of nitric acid. The simplest remaining explanation was to admit the existence of a second ingredient in the nitrogen obtained from the atmosphere. If the supposed gas had a density half as much again as that of nitrogen, the presence of one per cent. would suffice to explain the observed differences in density. This explanation brought the investigators face to face with the great improbability that a gas all about us and present

in such enormous quantity could have remained so long unsuspected. Its demonstration demanded the isolation and identification of the new gas, and to the solution of this problem the research was now directed.

It is interesting to note here that Cavendish, more than a hundred years ago, in his careful and exact study of atmospheric nitrogen, had really raised this same question of possible admixture with another gas. Describing his attempts to cause a complete union of atmospheric nitrogen with oxygen by means of the electric spark, he says: "If there is any part of the phlogisticated air [nitrogen] of our atmosphere which differs from the rest and cannot be reduced to nitrous acid, we may safely conclude that it is not more than 1-120th part of the whole." Cavendish, however, laid no emphasis on this residual 1-120th, except as indicating by its minuteness the great purity of the nitrogen from air. But in these days science no longer neglects "residual phenomena," and has found, in many cases before this, abundant evidence of the valuable results to be obtained by study of them.

In the first attempts to isolate the suspected gas, Cavendish's method was employed. Electric sparks were passed through air confined over weak alkali, and oxygen gradually added till in excess. The products of the union of nitrogen and oxygen caused by the spark were absorbed by the alkali, and finally, when no further absorption took place, the excess of oxygen was removed by alkaline pyrogallate. A residue was obtained which was in all instances proportional to the amount of air operated upon.

Another method for isolating argon, and which also serves for preparing it in considerable quantities, is as follows: Air from which moisture and carbon dioxid have been removed is freed from oxygen by passing it over red-hot copper, and from nitrogen by magnesium turnings heated to a bright redness. The removal of the last portions of nitrogen is a tedious operation, requiring some two days, when the residual gas is found to be pure argon.

The gas obtained by either of these methods has a density one-fourth greater than oxygen (16:20), and dissolves in water about two and a half times as freely as nitrogen. On account of its solubility, it is present in larger proportion in the gases dissolved in rain-water than in the air, as is indicated by the fact that "nitrogen" prepared from the gases expelled from water has a higher density than that from air.

The spectrum of argon has been examined by Prof. Crookes, who finds that "no other spectrum-giving gas or vapor yields spectra at all like those of argon," and says further, "As far, therefore, as spectrum work can decide, the verdict must be that Lord Rayleigh and Prof. Ramsay have added one if not two members to the family of elementary bodies."

Prof. Olszewski of the University of Cracow, well known for his researches on the liquefaction of air and other gases, was furnished with 300 cc. of argon for the determination of its behavior at low temperatures and high pressures. He reports that it can be liquefied only when its temperature is reduced (by liquid ethylene) to —121° C., and that the necessary pressure at that temperature is 50.6 atmospheres; or, in other words, that its "critical temperature and pressure" are —121° and 50.6 at. respectively. Its boiling-point is —186.9° C.; it freezes to an ice-like mass at —191°, and melts at —189.6°. In its behavior at low temperatures it stands between oxygen and nitrogen, whose critical temperatures are —118° and —146° respectively, and whose boiling-points are —182.7° and —194.4°.

Chemically, argon appears to be more inert than nitrogen, all attempts to induce chemical action with even the most active substances having proved abortive.

The facts so far obtained do not warrant a final decision in regard to its simplicity. If not an element, it is a mixture. There is evidence on both sides, but the balance seems to be in favor of simplicity. Not only does argon appear to be a single elementary substance, but its molecules are apparently of simplest possible structure. A determination of the ratio of its specific heats at constant volume and constant pressure points to the conclusion that its molecules are monatomic, *i. e.*, composed of a single atom each, instead of two atoms, as is the case in almost all elementary gases and vapors.

Certain very interesting and important theoretical issues are raised by this conclusion. In connection with the density which the gas has, it indicates an atomic weight of 40. But in this case there is no place for the new element in the tables of Mendeleieff, which express the periodic law, and which have been so generally accepted. If argon should turn out to be a mixture, the difficulty may disappear; but if its simple character is finally demonstrated, an awkward dilemma is offered between the validity of the periodic law and that of the conclusions drawn from the determinations of specific heat ratios. The periodic law of Mendeleieff is, after all, as Prof. Rücker has said, "an empirical law, which rests on no dynamical foundation." The present situation will strengthen many chemists in their feeling that, although the law is a generalization which has in it many elements of truth, and has hence proved of much value to chemistry, it is by no means a complete or final expression of the relations of the elements.

The discovery of argon is a brilliant achievement. As Prof. Crookes said before reading his paper on the spectra of argon, "Here we have a new chemical element, the principal properties of which seem to be the negation of all chemical properties. Chemists will understand how difficult it is to deal with anything which forms no compounds and unites with nothing. The discovery commenced by a prediction, followed after an interval by realization. . . . The prediction and discovery of argon are only equalled by the few discoveries . . . made . . . by the careful study of the periodic law, and to surpass it we must go back to the predicted existence and subsequent discovery of an unknown planet by Adams and Leverrier."

THE PROBLEM OF SARDINIA.

ALASSIO, Italy, February 7, 1895.

IN spite of beautiful scenery, picturesque costumes, and local color of the intensest hues, Sardinia is almost utterly unknown to the pleasure-seeking tourist. A few Italian sportsmen, disgusted with the poverty of game at home, visit the island in search of the mouflon, which is abundant there, a few archæologists are attracted by the *nuraghi*, or the gold idols of Tharros, but these and a few curious of one sort and another are but as a drop in the tide of travel. For the world at large, Sardinia might as well be in the centre of the Pacific as on a Mediterranean highway. As a matter of course, a land that is so little visited is deficient in hotels, few towns being able to boast even a bad one; and the railways, that cost the Government 11,000,000 lire a year over and above their receipts, can scarcely be expected to pamper their public with fast trains and luxurious coaches.

Moreover, in spite of great fertility of soil and rich mines—both sources of wealth in the times of Carthage and of ancient Rome—as well as of admirable harbors, the island is poor. Such industries as exist are chiefly in the hands of strangers. Foreign capitalists, it is said, are the principal owners of the mines; the railways were constructed by an Anglo-Italian association, to whom the Government gave at one time 200,000 hectares, about half a million acres of land; the tunny fishery yields annually large sums to fishermen from the towns and villages of the Genoese coast, while Genoese and Sicilians catch and sell the sardines (that take their name from the island) and the anchovies; and, finally, the coral-divers (except in the banks to the north of Sassari) come from Naples, and carry back there the fruits of their labors.

With agriculture the case is no better. A large part of the island is covered with barren mountains, and of the extremely fertile plains in the west, where the vegetation is of tropical luxuriance, only about half is under cultivation—if it can be called cultivation where the ground is barely scratched with a primitive substitute for a plough, and the use of manures is almost entirely neglected. And yet these plains were once the granary of Rome and of Carthage, and, by the use of proper means, the yield might to-day be greater than ever it was. The wild olive is abundant, and needs only grafting to give excellent results. The orange groves are the greatest and the most productive of the whole basin of the Mediterranean, and yet the fruit is not exported. Wine, for want of suitable treatment, is in general coarse and heady. Such as it is, it is sent in great quantities to the Genoese coast where it is mixed with the lighter native growths, not to their improvement, or sold at so low a price that the poorest can spoil their palates with it and muddle their brains.

Things have bettered a good deal within the last twenty years, but Sardinia still suffers from ills that will be long in the curing. With a surface very little inferior in extent to that of Sicily, Sardinia has less than a fourth as many inhabitants. The mountains support a few half-barbarous shepherds, while in the plains the *intemperie*, a malarial fever fatal to strangers, reigns during four or five months of the year. Indeed, the climate of the Sardinian lowlands has from the remotest antiquity been known as one of the deadliest in Europe. Of course, a system of draining, such as has reclaimed a part of the Tuscan Maremma, may some day remedy this evil; where only a small fraction of the land (one-fifth, it is said) is private property, even this means will not insure the entire development of the soil.

Nor is the task of adapting the Sard to the conditions of modern civilization altogether easy; and not long ago the attention of Italy was called to one of the problems that are still imperfectly solved—that of public security. Various exploits of brigandage were followed, in November last, by an armed aggression with robbery, at once so bold and so atrocious that it was quite evident that the ordinary measures for the protection of life and property were now inadequate. A band of men, perhaps a hundred in number, took by assault and sacked a house. The feat was accompanied by a battle with the carabinieri, which lasted,

if I remember rightly, two or three hours, and in which several persons were killed and wounded. As one of the results of this affair, the Milanese *Corriera della Sera* sent a correspondent to report upon the state of public security in the island. His letters reveal a condition of morals, a survival of mediæval barbarism in the nineteenth century, that is more curious than admirable.

Brigandage, robberies, the vendetta, deeds of violence of all sorts, have from time immemorial been common in Sardinia. The innumerable conquests of the island, with the attendant wrongs and bad government, would, in great measure, account for the fact, and that it has been left as a legacy to our times. Under the present rule a large part of the population has been made amenable to law and order, and the continuance of the ancient régime of rapine and murder has been confined to certain portions, chief among which is the mountain district of Barbagia, about the huge mass of Gennargentu, where the inhabitants have preserved for two thousand years their reputation of indomitable barbarians. Carthage, Rome, Genoa, Pisa never subdued this part of the island, and it is evident to-day that the work of civilization has here still to be done. A few details, which I borrow almost exclusively from the correspondent of the *Corriera della Sera*, will show the extent of the evil.

The assault upon a house in Tortoli, which, as I have already said, resulted in loss of life as well as of property, was made by a band composed of about one hundred men, most, if not all, of whom, it seems, were well-to-do, and had not the excuse of want to palliate their outrage. Though they destroyed the furniture of the house with hatchets, they took away only gold and jewels. The floor was everywhere left covered with objects that would have tempted a poorer mob. Such arrests as have been made were all among families of means.

What is singular is that there are so many of the same sort—that is, the men concerned are above need and rob for the love of sport, just as others fish or shoot game. Of course there are poorer men who make up their own deficiencies from the store of their neighbors, and depredations are most frequent in hard times. In general, however, the prospect of a rich booty is enough to arouse in all classes the uncontrollable desire of spoliation. I said *all* classes: two anecdotes communicated by a Sardinian to a Roman journal will serve to show that the expression may be taken literally. A *sottoprefetto*, after having well studied the district over which he was set, was asked by the Minister of the Interior to furnish a list of dangerous persons with a view to their surveillance, and replied that, if he answered conscientiously, he must head the list with the district's member of Parliament. Another *sottoprefetto* of the same *circondario* was, shortly after a great robbery conducted with a stealth that had baffled the police authorities, invited to dine with one of the notabilities of his town. In unfolding his napkin at the table, the official cast down his eyes and recognized, to his horror, the forks and spoons marked with the name of the victim of the misdeed.

Another singularity of this state of things is that the robberies are not effected by regularly organized bands. A band is formed, 50, 80, or even 100 strong, as each occasion arises, and is dissolved once its purpose is accomplished. Their formation can scarcely be a matter of great difficulty when there are plenty of towns and villages where nearly the entire population is ready for such enterprises. In many cases they never commit depredations within the limits of their own commune, but the general condition is not benefited by this restriction. Indeed, it is said that not long ago a lawyer defending a too-notorious client, turned to the jury in a burst of eloquence: "In fact, gentlemen, who among you would have refused to take part in a robbery where it was a question of 40,000 francs!"

The apostrophe was perhaps unnecessary. Convictions are not easy. Except by those who have been immediately injured by him, the culprit is not generally looked on with severity, false testimony is had without difficulty, and the witness who insures conviction does so at the peril of his life. Cases are common where the witness has been afterwards murdered by the bandits or their accomplices. The vendetta, with subsequent retaliations, sometimes breeds between families a feud of extermination. Only the other day I read in the newspapers of a letter addressed to the public prosecutor by a well-known outlaw, who threatened new crimes if his wife and others, kept in confinement as accessories, were not at once released. Is this state of things, is this state of mind, sufficiently mediæval? The mountain fastnesses swarm with bandits, robbers, murderers, all fugitives from justice, and between the terror they inspire in some and the sympathy in others, their conviction, even if captured, is by no means a matter of course.

In some places, men who have accumulated some hundreds of thousands of francs by a long series of crimes are among the leaders of society, well spoken of, and looked up to by their neighbors. In cases of highway robbery, etc., the newspapers are apt to dwell upon the courage and address of the criminal with ill (or not at all) disguised admiration. One knows of lands where a woman who has stooped to folly, and tries to straighten matters with a revolver, is always described in the journals as graceful and fascinating. Nursed by such sympathy, neither evil is going to mend itself. The efficacious cure is the slow one of civilization; but meanwhile violence must be discouraged, life and property must be protected. Armed force has been tried more than once, and for the time being its efforts have been crowned with success. In the beginning of the last century, under the reign of Carlo Emanuele III., the Marquis di Rivarolo, with the aid of a few troops, hunted down the bandits with fire and sword, and with such energy and system that in 1737 there were none left in the island. Again, in 1749, the Chevalier Valguarnera pursued the same tactics; and later, again, the Marquis di Villamarina, it is said, thought it necessary to hang seven malefactors every day, and both achieved excellent results. But each period of severity was followed by one of laxity, and the accursed race cropped up again. In fact, the dark ages have from time immemorial reigned in the wild regions about Mount Gennargentu, and they reign there still. You can scarcely expect to make over the dark ages into the latter-day serenity of labor movements, socialism, populism, anarchism, and the like, merely by stringing up a few of the blacker sheep. Still, there is much to be said for the régime of repression, and it is a question whether this be not a moment for another Marquis di Rivarolo.

The Italian Government has asked itself this question—in the fashion of governments. It has sent the *onorevole* Pais, Deputy to the Italian Parliament from a Sardinian district, to inquire into the causes of the bad state of public security and to indicate the best means for its restoration. It has charged him at the same time "to study and report on the true economic conditions of Sardinia, and on whatever may concern its agricultural, industrial, and commercial movement."

It has been objected, and with a remarkable show of reason, that, from the days of the Depretis ministry to the present, no less than three similar inquests have been ordered by the Government; that, moreover, the prefects have constantly kept their superiors informed, and that their reports have been supplemented by a multitude of other sources of light, so that the ministry has already sufficient knowledge of the circumstances as well as ample indications of the measures to be employed; that, as a consequence, it is folly for an overburdened Treasury to waste money upon a new investigation.

It is further objected that, even were there occasion for this inquiry, Sig. Pais is not the man for conducting it. As a Deputy he was presumably chosen for his acquaintance with the wants of the country, is in constant relations with it, and could have given, without the delay of an extra journey, all that he is capable of seeing and the means he has to propose for the future action of the Government. Again, as a Sardinian, he can hardly hold himself aloof from the influence of friends, clients, and electors, from a thousand open or occult influences, all of which tend to prevent his taking a full, unbiassed view of the truth. Finally, one of the reasons why things in Sardinia do not go as they should is that the Deputies of the island, often unwittingly, are so many hindrances in the way of proper judgment and proper action on the part of the central authority.

For all that, Sig. Pais is already at work, and I see that he proposes that the Government should immediately begin a new series of public works in Sardinia. It is the sort of recommendation to be expected, not from Sig. Pais alone, but from almost any insular Deputy. It is the politician's substitute for the "faithful study of the liberal arts" which, in the language of the old Eton Latin grammar, "Emollit mores, nec sinit esse feros." The honorable gentleman has been but a short time on the ground, and it is not quite fair to look yet for results from his panacea. At any rate, the already mentioned letter from the bandit Sedda to the public prosecutor was written since the return to the island of Sig. Pais, and still later I read of a new descent of a band of shepherds upon a comrade whom they probably deemed too fortunate. They had already taken several sheep, when the watch-dogs roused their owner, who came out with a stick and felled dead the chief of the band. The others, instead of flying, fired upon him, but the fortunate proprietor was this time, at least, happy in that he escaped unharmed and ran to the carabinieri. The results of the affair are not yet known to me, but with such men and such manners the incident can hardly be considered as closed. Poor Sig. Pais, poor Government, poor Sardinia! Is it possible that 1895 has to look for its best teaching to 1737? S. K.

MEMOIRS OF THE DIRECTORY.—II.

PARIS, February 13, 1895.

THE début of the Directory was very modest. We have seen the five Directors make their entrance and their first arrangements in the Luxembourg. Some of these men are now quite

forgotten. Larévellière gives his opinion of all of them, and is not over-indulgent towards his colleagues. He speaks first of Rewbell, who was, before the Revolution, a lawyer at Colmar, in Alsace, where he enjoyed much consideration. He was fifty years old when he was appointed Director. "He had an excellent head, profound judgment, and much cleverness; he was a great expert in all parts of the administration, from the highest diplomacy to the minutest practice at the bar. Few men, in respect to intellectual faculties as well as acquired knowledge, have possessed greater capacity for government." The portrait of Barras is not so flattering. Born of a noble family of Provence, he had first served in the army in India, till the French Governor, Bellecombe, had to capitulate in Pondicherry. He had a fine face, but no dignity, "and always preserved something of that common and bold air which is found in bad company." He had no application for work, only for intrigue. "Debauchery, gambling, the pleasures of the table, had perverted and dishonored his youth. . . . At the Luxembourg he was surrounded only by the most crapulous chiefs of anarchism, the most corrupt aristocrats, abandoned women, ruined men, jobbers, gamblers, mistresses, and favorites."

"I have heard him tell," continues our author, "as something very amusing, the arrangement which he made with the famous contractor, Ouvrard, whom he forced to take as his mistress *en titre* Mme. Tallien, his own mistress. Ouvrard did not wish to have anything to do with Mme. Tallien, but was obliged to keep her at least *ad honores*, and thus satisfy the expenses of such a devouring woman. Otherwise, he would have had to renounce in future any part in the army contracts, and he would have run the chance of being disturbed in the fortune which he had already acquired. And it was at Grosbois, in the house of Barras, a member of the Executive Directory of the French Republic, where a numerous company was assembled, that all the formalities of this infamous agreement were executed!"

Carnot is even more severely handled. A captain of engineers before the Revolution, he was elected a Deputy to the Legislative Assembly from the Pas-de-Calais. He remained obscure till he became in the Convention a member of the famous Committee of Public Safety, who really governed France during the Terror.

"He distinguished himself by the very important services which he rendered in the War Department. Happy would it have been for him if, during that time, he had refused to take part in the crimes of that committee, and if he had vigorously opposed the atrocious system which it followed. If we cannot forget the brilliant campaigns of which he is said to have traced the plans, can we remember without shuddering the numerous death-orders which he signed—he, the third signatory for so long a time—and his atrocious correspondence with Joseph Lebon [one of the proconsuls of the Convention]?"

The first ministers chosen by the Directory are now well forgotten—Trouvé, Bénézech, Merlin, Aubert du Bayet, Charles Delacroix, Truguet, Faypoult. The real work was done by the Directors themselves; they had to reorganize the armies, to reëstablish some order in the finances, to create new taxes, to defend themselves against factions, to organize a new police. The two councils were divided: on one side were the ancient Terrorists, on the other the men who were tired of the Revolution, the former members of the Gironde or of the Plain, who had in their ranks some eminent men. The Royalists were represented in the Legislative Council; they had some generals on their side, they had a number of influential papers. The Directory, placed between the Jacobins and the Royalists, was itself divided. Bonaparte was one of its supports; he had defended the Convention on the 13th Vendémiaire against the Royalists; he had been placed by the Directory at the head of the Army of Italy.

"People have said that his marriage with the widow of Beauharnais was the condition of his obtaining a command which was the object of his ardent wishes; it was not so. There was, to be sure, a very intimate alliance between Barras, Bonaparte, Fréron, Tallien, and Mme. de Beauharnais, Mme. Tallien, and others. This set had a double object, jobbing and pleasure. . . . What I can affirm is, that in making choice of Bonaparte for the Army of Italy the Directory was influenced by nobody. All the members of the Directory adopted the views presented by Gen. Bonaparte. We said he must be appointed, and he was appointed."

The glorious campaign in Italy gave to the Directory a singular ascendancy in Europe, though it continued to be very weak at home. Preliminaries of peace were signed at Leoben. During the negotiations, Napoleon received one day at Montebello a visit from a French savant, André Thouin.

"While they were taking their coffee together, after dinner, Bonaparte complimented him on his researches, and spoke like the sternest moralist of the misfortunes and horrors of war, the vanity of glory. Bonaparte left the room for a moment, after his homily, and Mme. Bonaparte said: 'Well, you have heard, Citizen Thouin, the fine speeches and fine sentiments of Bonaparte. Don't believe a word of it. He deceives himself as he does others, very fortunately. His is the most uneasy spirit, the most active head, the fullest of projects, the most ardent imagination, and the most obstinate will in the world.'"

Larévellière confesses having been long deceived by "the profound dissimulation" of Bonaparte. He felt that the Directory would soon have need of a general, not only on the Rhine and on the Po but on the Seine. There was a complete scission between Rewbell, Barras, and Larévellière, on one side, Carnot and Barthélemy on the other (Barthélemy had replaced Letourneur). Larévellière and Rewbell had no confidence in Barras, the unsafest of allies. Bonaparte was aware of these divisions; he sent one of his aides-de-camp, Lavalette, to keep him fully informed. The Directory, threatening or affecting to be threatened by the Royalists, asked Bonaparte, who could not or would not leave his army, to send one of his generals to Paris. Bonaparte chose Augereau. Larévellière, Rewbell, and Barras planned with him the *coup d'état* of the 18th Fructidor. Augereau was placed at the head of the military division in Paris. Talleyrand, who had come back to Paris, was appointed Minister of Foreign Affairs. "At every instant, Rewbell and I were exchanging doubts. What was there not to be feared, in such circumstances, from an ignorant man like Augereau, and from a man without conscience like Barras?" At every moment they thought themselves betrayed.

On the evening of the 17th Fructidor the Directors resolved to strike the blow; in the middle of the night 12,000 men with 40 guns entered Paris, occupied the quays, the Hôtel de Ville, the Champs-Élysées, and enveloped the Tuileries. At six o'clock in the morning all was ended. The minorities of the Councils assembled, and with their permission the Directory condemned to deportation five Deputies, as well as the two Directors Barthélemy and Carnot. The laws against the émigrés were again put in force; the condemned Deputies were sent to Cayenne or to Oleron. Barthélemy fled to England, Carnot to Germany. They were replaced by Merlin de Douai and François de Neufchâteau.

The 18th Fructidor was the great event in the life of Larévellière. He takes a deal of pains to justify his *coup d'état;* there was no other way, in his opinion, to hinder a counter-revolution and the return of the monarchy. The majority of the two councils were in favor of a counter-revolution. Larévellière is proud of the 18th Fructidor. "But for me," he says, "it would never have taken place. . . . Without a third man of a conciliating spirit, and who had never belonged to any faction, Rewbell and Barras would never have worked together, and I had often much to do to keep them united." Must we believe him when he writes, "On the 18th Fructidor there was in Paris more than satisfaction, there was enthusiasm. My capacity as President and my speeches at the public sitting of the 10th Fructidor showed me to the public as the principal author of this *journée*." Mme. de Staël, in her 'Considérations sur la Révolution Française,' has not been lenient in judging the 18th Fructidor, which was a violation of the Constitution. "Qui veut la fin, veut les moyens," says Larévellière, and all constitutional means were, in his opinion, powerless to prevent the counter-revolution; which is an admission that the majority of the French people desired a change. The 18th Fructidor was a parody of the Terror; it was helped indirectly by Bonaparte, and was the preface to the 18th Brumaire.

Larévellière will be remembered in history only as one of the important actors in the *coup d'état* of Fructidor, unless also as one of the sectaries of a new religion which flourished a moment under the name of Theophilanthropy. He was not, as has sometimes been said, the founder of this sect; he says that the real founder of it was Valentin Haüy, brother of the famous mineralogist, and inventor of new methods of education for the blind. The dogmas of the new religion were of the simplest: the Theophilanthropists professed to believe in a God and in the existence of a soul—they were pure deists; but they made themselves ridiculous by having new forms of worship, and their number was always very insignificant.

"Patere legem quam fecisti," is an axiom which Larévellière never understood; he was destined to see a *coup d'état* which seemed to be almost copied after the 18th Fructidor. After the death of Kléber and Hoche, Bonaparte became the most prominent general in the French Army. His military glory had already eclipsed everything. The Directory had been weakened by the retirement of Rewbell, who had been eliminated by lot, and replaced by Sieyès, who affected the greatest apathy and indifference to all the affairs of the Republic. We come first to the crisis of Prairial, in the year vii. There was much agitation in the two Councils. Barras and Sieyès formed a coalition against the three other Directors. Sieyès urged Merlin de Douai and Larévellière to resign, Barras used the same entreaties; a deputation of the Councils also asked for their resignation. Larévellière resigned; he took his portfolio under his arm, and left for his little house in Andilly, near Montmorency. Talleyrand made him a visit there a few days afterwards; he told him that Sieyès had not succeeded in becoming master of the Directory; the new Directors were Gohier, Moulin, Roger-Ducos. The two Councils did not want a strong Directory.

Larévellière gives some details concerning not the 18th Brumaire, but the events which followed. The two Councils had been dissolved and replaced by a Committee, who prepared a new constitution. Sieyès framed it

in its general outlines and Bonaparte corrected it.

"The Constitution, thus arranged at the instigation of the ambitious general, provided three consuls, appointed for three years—the first consul, who was everything, a second and a third consul, who were nothing. . . . When there was a question of choosing the four personages who should be proposed to the people for the functions of consuls and of president of the Senate, a ballot was to be taken. A model of a litre or a decalitre [it was the time of the invention of the metric system] exhibited in the room of the commission served as an urn. The ballots deposited were about to be counted. Bonaparte was before the chimney, his back turned to the fire. 'What is going on?' said he, with a certain air of superiority. 'You see, general, we are taking a ballot.' During this question and the answer, Bonaparte slowly approached the table, took the decalitre containing the ballots, threw them into the fire, and put it back on the table, saying on his way, 'That is all useless; we have here Citizen Sieyès, the one man in France who understands the Revolution best, and he is in position to appreciate with justice men and things. It is for him to indicate to us the men who are best fitted for the dignity of consul and for the presidency. Well, Citizen Sieyès, tell us whom we ought to name First Consul. . . .' Sieyès, after having tried to decline the honor, finally said: 'Everybody knows that Gen. Bonaparte is to be First Consul.' 'Well, citizens,' said he, 'put my name in the draft of the Constitution.' And it was done accordingly."

Sieyès afterwards chose Cambacérès and Lebrun; he was in this way obliged to exclude himself from the Consulate, and the Presidency of the Senate was left to him.

The public life of Larévellière came to an end in Prairial; he never was among the courtiers of Bonaparte, and lived in retirement. He was one of those men whom fortune brings for a moment on the stage of history in revolutionary times. His memoirs show him to have been very ordinary, very mediocre, possessed of inordinate vanity and a great incapacity for understanding even the events in which he played a part. His political essays, which form the third volume of the memoirs, might well have been left to oblivion.

Correspondence.

THE BOND BARGAIN.

To the Editor of The Nation:

Sir: Those who condemn President Cleveland's course in the recent bond issue mostly lose sight of the Government's real position in the matter. They forget that the Treasury was really buying gold in a market partially cornered, and merely giving our interest-bearing obligations in payment therefor. If the apparent discrepancy between what was obtained for the bonds and what should have been obtained be charged to premium on gold, the truth will be more nearly approximated.

It will be argued by some that there was no premium on gold at that time. Between individuals perhaps not. But the individual had the Government reserve to fall back upon. When it comes to replenishing that reserve, the Government is placed in the same relation to the gold supply as an individual would be if the reserve were wiped out. To say that there would be no premium on gold if the Treasury reserve should entirely disappear, would be a statement too absurd for argument.

We must also not lose sight of the large amount of gold required and the urgency of the situation, partly as justification for the premium paid, and partly as an apology for any seeming undue activity of the President in the matter. W. M. Haley.

St. Louis, February 22, 1895.

"PARLIAMENT-MAN."

To the Editor of The Nation:

Sir: In the *English Historical Review* for July, 1893, Mr. S. R. Gardiner wrote that the first instance he had noticed of the title "Member of Parliament," employed as the designation of any one person, was in 1650, though in 1642 it had been employed as a common designation of members of the two houses. He concluded that "unless an example can be produced of the use of the term of a member of one house only earlier than 1649, it may be inferred that the title originally given as a common designation for members of the two houses became the designation of one when, after the King's execution, the House of Commons declared itself to be the Parliament." The equivalent term, "Parliament man," is not mentioned by Mr. Gardiner; but it can be shown that this term, as applied both to a member of the House of Lords and to a member of the House of Commons, was frequently used during the first half of the seventeenth century.

"Sundry parliament men are dead since the last session, as Sir Thomas Atye, Sir Edward Stafford, . . . young Sir Henry Beaumont, &c., wherein your lordship may note, that it hath lighted most upon fat men. For lords I find none dead but the Lord Windsor."—1605, Sir E. Hoby, in *Court and Times of James I.* (1849), i., 35.

"We talk here as though the Earl of Southampton should refuse to answer the commissioners assigned, unless they accuse him of felony or treason, because he is a Parliament man; but I cannot hear much confirmation of it."—1621, J. Mead, in *do.*, ii., 265.

"Mr. Lyttleton so played his prize in the stating and arguing of our parliament-men's [Sir J. Eliot, etc.] case at the King's Bench Bar, on Friday, the first day of the term, that he hath won eternal praise."—1629, Sir G. Gresley, in *Court & Times of Charles I.* (1848), ii., 17.

"One Mr. Rigby, a lawyer and parliament man, wealthy and religious, had purchased the Plough Patent, lying at Sagadahock."—1643-'49, J. Winthrop, *Journal* (1790), 323.

"Sir, tidings are high from England; many ships from many parts say, and a Bristol ship, come to the Isle of Shoals within a few days, confirms, that the King and many great Lords and Parliament men are beheaded."—1649, Roger Williams, *Letters* (1874), 181.

This term, analogous to our Congressman, remained in vogue for another century, being found in the writings of Bishop Burnet, Chesterfield, Dryden, Evelyn, Bolingbroke, Farquhar, Fielding, Cotton Mather, Lady M. W. Montagu, Pepys, T. Randolph, Vanbrugh, and others; but after about 1750 it seems to have fallen into disuse. Albert Matthews.

Boston, February 1, 1895.

Notes.

The Life of George Borrow, on which Prof. W. I. Knapp of Chicago University has been long engaged, is likely to be published this year, says the London *Bookman*, in three volumes.

Archibald Constable & Co., London, will issue in May 'The Alps from End to End,' by W. Martin Conway. This is a narrative of climbing in three months of 1894, with some of Mr. Conway's Himalayan sepoys as assistants. There will be 100 illustrations.

J. B. Lippincott Co. of Philadelphia have in preparation the tenth volume of Mr. Horace Howard Furness's Variorum Edition of Shakspere, viz., "A Midsummer Night's Dream," and 'Lives of the Astronomers,' by Robert Ball.

Geo. P. Humphrey, Rochester, N. Y., will publish directly a reprint of Bartram's 'Observations' (London, 1751), adding thereto an inedited map of Oswego made by Lewis Evans, Bartram's companion on his American travels, and a view of Niagara Falls from the *Gentleman's Magazine*, 1751. The edition will be limited to 300 copies.

Ginn & Co., Boston, will bring out in April 'The Religions of India,' by Prof. Edward Washburn Hopkins of Bryn Mawr.

D. C. Heath & Co. have nearly ready 'The Educational Ideal: An Outline of its Growth in Modern Times,' by J. P. Munroe.

'Social Theology,' by the Rev. Wm. De Witt Hyde, President of Bowdoin College, 'In Stevenson's Land,' by Marie Fraser, and two books on Physical Geography by Prof. Ralph S. Tarr of Cornell, are in the press of Macmillan & Co. This house will hereafter act as publishers for the American Economic Association, and will carry its publications in stock.

J. Selwyn Tait & Sons announce 'On India's Frontier; or Nepal, the Gurka's Mysterious Land,' by Henry Ballantine, late American Consul to Bombay; 'The White Tsar, and Other Poems,' by Henry Bedlow, in an *édition de luxe;* and 'The Romance of Judge Ketchum,' by Horace A. Vachell.

In the reprint of 'Little Dorrit,' Macmillan & Co. choose not the first edition, as in the previous volumes of its popular reissue of Dickens, but that corrected by the author in 1869. The younger Dickens supplies the usual introduction, which is doubly enlivened by a good-natured examination of Mr. Forster's remarks on this novel, and by Dickens's reply to the owlish criticism of the *Edinburgh Review*. The series now numbers a round dozen volumes, if our c unt be true. Mr. Wheatley's edition of Pepys's Diary (Macmillan) is continued in a fifth volume, ending September 30 of the *annus mirabilis*. Pepys was persuaded that "this year of 1666 will be a year of great action" from a book he bought on February 19, 'An Interpretation of the Number 666.' The sea-fight with the Dutch and the great London fire are embraced in this volume, which has for its frontispiece Hayls's portrait of Mrs. Pepys, which her husband resolved on St. Valentine's Day to have painted. His own, painted shortly afterward, was given with volume i. The same firm sends us the first of its series of reprints of famous novels, containing Miss Edgeworth's 'Castle Rackrent' and 'The Absentee,' gracefully introduced by Mrs. Anne Thackeray Ritchie, with the aid of a personal visit to the Edgeworth home. The typography is handsome, and there are pen-drawn illustrations in the text, by Chris Hammond. Each story has a brief historic note respecting its composition and estimation.

Stone & Kimball, Chicago, have made a characteristically dainty volume of the late Robert Louis Stevenson's 'The Amateur Emigrant—From the Clyde to Sandy Hook.' The final chapter is a picture of New York from an unusual point of view.

There is an obvious convenience in having the lives of our Presidents packed in one volume. Those contained in 'Appletons' Cyclopædia of American Biography' have been thus grouped in 'The Presidents of the United States 1789-1894' (Appletons). The editor of the Cyclopædia, Gen. James Grant Wilson, has edited this collection also, supplementing the original sketches with notices and por-

traits of wives and children, and furnishing a facsimile of each President's handwriting. Mr. John Fiske is the author of five of the twenty-three biographies, and no other writer contributes more than one. Generally an admirer or previous historian of the President in question has been sought, as Robert C. Winthrop (Washington), James Parton (Jefferson), D. C. Gilman (Monroe), George T. Curtis (Buchanan), John Hay (Lincoln), Horace Porter (Grant), Wm. Walter Phelps (Garfield), Wm. E. Russell (Cleveland). Sometimes the writer is an ex-office-holder, as George Bancroft (Polk), Carl Schurz (Hayes). Jefferson Davis writes of his father in-law (Taylor). One of the very best is the late President Welling's (Van Buren), noticeable because of its compactness, though the author's style was naturally diffuse. The steel engravings of the Presidents are rather wooden.

The adoption of the new Constitution in this State naturally occasions a new and revised edition of Mr. Orlando Leach's 'State and Local Government of New York' (Leach, Shewell & Sanborn). Including now the text of the new organic law, it retains the convenient rubrics and the full index of former editions, which make it a volume both useful and handy.

The ninth, revised edition of Annesley's 'Standard Opera Glass' (B. Westermann & Co.) is a handy little volume of 350 pages, in large type, which opera-goers will find a convenience. It contains the plots of 115 operas, clearly told, with brief historic notes and comments on each one—Verdi's "Falstaff" among the number, as well as Humperdinck's fairy opera "Hänsel und Gretel," which is now the craze in Germany. It is, indeed, thoroughly up to date. But why should such operas as Grammann's "Ingrid," Förster's "Maiden of Schilda," Lindner's "Master-Thief," which never have been and never will be given outside of Germany, be described, while Rubinstein's "Nero," Wagner's "Fairies," Reyer's "Sigurd," and the operas of Saint-Saëns, Smetana, and Tchaikovsky are omitted? Taken all in all, however, the list is judiciously made. The opinions advanced, too, can be generally approved, although there is an occasional absurdity, like the statement that Wagner's "Meistersinger" "is highly original, though not precisely melodious"; or this, that "Verdi is far beneath his celebrated predecessors, Rossini and Bellini."

The J. B. Millet Company, Boston, have followed up their 'Famous Composers' with 'Half Hours with the Best Composers,' which consists solely of pieces for the piano selected from the whole range of musical literature. The editor is Mr. Karl Klauser, of whom Mr. Theodore Thomas says, in a preface, that he does not know any man so well qualified to edit such a work. A catholic taste is evinced in the selections, which range from drawing-room music to the various representatives of the classic and romantic schools. A unique feature is the inclusion in each volume of a piece (with biographic sketch and portrait) by an American composer, from a list worth repeating here: William Mason, Reginald de Koven, Walter Damrosch, Richard Hoffman, Frank Van der Stucken, Henry Holden Huss, Dudley Buck, William W. Gilchrist, Emil Liebling, John Knowles Paine, Arthur Foote, E. A. Macdowell, Geo. W. Chadwick, Clayton Johns, Ethelbert Nevin, Benj. E. Woolf, Arthur Bird, Ad. M. Foerster. The Millet Company have also established a Composers' Bureau for revising musical manuscripts or finding a market for them.

From Mills & Thompson, Boston, we have Mr. J. F. Botume's 'Exercises in Vocal Technique,' sixty pages of exercises so arranged as to be suitable for all voices, with a preliminary chapter conveying much sound advice. Mr. Botume is not one of the charlatans who come out every week with a new method, but bases his remarks on the common experiences of great teachers, from Caccini to the present day.

Mr. Charles A. Houfe, headmaster of Aysgarth School, Yorkshire, has lifted out of a contemplated work on 'The Premiership, the Houses and the Crown' 130 pages on 'The Question of the Houses' (London: A. Constable), which he now offers as a contribution to the great political issue of the day in Great Britain. Writing as an ardent Liberal-Unionist, he yet admits the need of doing something to prevent the scandal of the Lords exemplifying the theory of a conservative check on hasty legislation only in the case of laws passed by one party. His remedy is to compel an immediate referendum on all bills thrown out by the Lords. Mr. Houfe has many ungentle things to say of American institutions, and is amazed at the ignorance of American writers. His book invites serious retort in kind; but a production so academic, in both senses of the word, hardly deserves it.

The qualities that mark the work of M. Victor Duruy, whose death France, and not France alone, now laments, are too widely known to make it necessary to do more than mention the appearance of his 'History of Modern Times, from the fall of Constantinople to the French Revolution' (Henry Holt & Co.), translated by Prof. Grosvenor of Amherst College, making, with Prof. Adam's translation of the same author's 'Middle Ages,' a work desirable in all colleges and libraries. We have here again the mastery of material; the perception that there is a story to tell, joined with the power of telling it; the breadth of view; the unaffected, natural interest in the affairs and achievements of all nations and races, regarding all with an equality of sympathy in spite of the differing values of their contributions to the development of mankind, removed at once from the traditional English attitude toward extra-insular peoples, so suggestive of studies in comparative psychology, and from that of the Germans, so bent upon accurate reproduction and evaluation of the past that they get up flashlight views at last, with all the delicacy as well as the life of it lost in the process. The translation reads easily and bears traces of close adherence to the original, but it has the defect of this virtue in an over-close following of form—that common fault which has deluded so many people, familiar only with their vernacular, into the belief that they understood the chief characteristics of foreign styles.

Prof. Emerton's 'Mediæval Europe (814-1300)' (Ginn & Co.) is a useful manual, although subject to the inevitable limitations of an attempt to achieve the impossible by compressing within the compass of 600 duodecimo pages the political, religious, and intellectual history of Europe during the five centuries which laid the basis of modern civilization. The resources of the most universal scholar might well be severely tested in the accomplishment of such a task, and even he would find them insufficient without an instinct of historical perspective serving as an infallible guide in the selection and rejection of details. In this Prof. Emerton has been reasonably successful, though in some chapters one may feel that there is a somewhat confused crowding of facts, and in others that a convenient vagueness covers the lack of a firm and assured familiarity with the sources of knowledge. It would perhaps be too much to expect that in treating a theme so vast, a writer should draw only on the results of original research, but when we see the predecessor of Charles the Simple spoken of (p. 90) as Otto of Paris and (p. 154) as Eudes of Paris, we are perhaps justified in inferring that in the one case the author has followed a German and in the other a French authority, without having grounded himself on contemporary documents. The book is a good one for the object designed, and will serve a very useful purpose in the class-room, but the lists of authorities which accompany each chapter leave much to be desired with regard to the needs of students who desire to pursue the subject further.

A new treatise on Meteorology, by Thos. Russell, lately professor in the Weather Bureau, and now assistant U. S. engineer, is just published by Macmillan. It gives a general account of meteorological instruments, and of the distribution of temperature, the movement of the winds, the occurrence of storms, and other meteorological phenomena, but in an expository rather than an explanatory style. The more notable features of the book are its chapters on weather and flood prediction. Prof. Russell, having paid especial attention to these matters while in the Weather Bureau, now gives the fullest account of the methods employed that is to be found in our language. While the prediction of the weather is based on simple principles, the application of these principles to the endless variety of weather forms presented on the daily maps is shown to be a matter of great difficulty, not reducible to brief or elementary statement, and requiring serious and persevering study before reaching practical usefulness. The prediction of the time and amount of rise in river-floods is fully explained, following the methods employed in France. The accuracy of many of these predictions is remarkable. The volume is illustrated with a number of weather-charts and figures of instruments.

An economic and geologic map of the State of New York, showing the location of its mineral deposits, has lately been issued by Mr. F. J. H. Merrill, director of the State Museum at Albany. It is reproduced from an original map prepared for the Chicago Exhibition, and now given wider use by publication. Twenty color divisions indicate the succession of formations from the ancient crystalline rocks to the glacial clays and gravels. Besides these, there are seventeen over-printed signs, marking the location of quarries, mines, clay-pits, oil-fields, and so on, in much detail. The distribution of valuable geological products according to the sequence of geological formations is nicely illustrated, and makes the map of value for local school use. The scale of the map is about twelve miles to an inch.

The publications of the New York State Weather Service under the direction of Prof. E. A. Fuertes of Cornell University have been, both as monthly bulletins and annual reports, maintained in excellent form for several years past. They form a valuable fund of information of current value, as well as an accumulation of trustworthy climatic summaries. The records of the bureau at Ithaca are frequently referred to by engineers, boards of health, chambers of commerce, and others. It can only be an extreme application of the penny-wise, pound-foolish principle that calls for the abolition of such a service, although this has been recently recommended by a committee of the State Legislature.

We welcome a second edition, revised and enlarged, of Miss Hewins's 'Boys' and Girls' Books in the Hartford Public Library'—one more representative of a class of library guides which ought to be found in every library as well as in the one from which it emanates. The index should, we think, be converted into a table of (the classified) contents—in other words, placed at the beginning instead of at the end; and such a title as 'Amusements' might well be analyzed.

The American edition of the *Bookman* (Dodd, Mead & Co.) begins with the February issue. It abandons the generous form of the English periodical, and ranges itself in appearance and almost in bulk among our foremost literary magazines, with which it competes on one side with articles like Mr. Mabie's on "Books and Culture," or Prof. Boyesen's on "German and Scandinavian Literature in 1894" (both first papers), or Mrs. Hinkson's Reminiscences of Christina Rossetti. On another side its gossip marches with the *Critic's*. It has the pictorial features of its original, with an increase. Its book reviews are partly signed, partly anonymous. It has a poetry column or section. We observe that it has, in its News Notes, fallen into the same error as the *Tribune* of February 10, which announced: "Bryce's 'American Commonwealth' cannot be purchased in Russia, the censor being very careful to keep so splendid a lesson in republicanism out of the hands of his countrymen." But the fact is that the work was translated and published there, in 1889 and 1890, in three volumes, the edition consisting of 1,200 copies.

M. A. Cartault, in the *Revue Internationale de l'Enseignement* for January 15, writes thoughtfully of Virgil's evolution, from the Bucolics to the Georgics. That the former mark a tentative period—the poet seeking his vocation; that Virgil imitates, not from poverty, but from choice, purposely setting what is his own against the very pick of Alexandrine work; that in the Georgics he is, as in the Bucolics, the one poet of true love—with all this we agree. But that he was already in the Bucolics the great master of the Georgics, we cannot admit. Beautiful as they are, the Bucolics are mere "academic figures" to the masterwork. Again, M. Cartault errs in giving Virgil a nature too open to external impulsions. Virgil spontaneously joined a band of writers who, judging the Republic to be dead, saw the world's hope in Octavian's rule, gladly lent it the prestige of their genius, but would not be mere trumpets of his fame. Virgil, like Horace, was asked to sing Octavian's exploits—in vain. But he gave the Georgics, a pledge of restored peace and a guide to quietness and respect for the gods, and the 'Æneid,' a poem second only to the 'Iliad' as a nationalizing force, and destined to be one of the most potent factors in holding together for many ages an empire profoundly disintegrated and ready to crumble into fragments.

At the session of the Academy of Inscriptions and Belles-Lettres held on January 25, M. Michel Bréal communicated a Latin inscription recently found in Tunis, which is remarkable both for its historical contents and for some linguistic peculiarities. This inscription was found at Kourba, not far from the city of Tunis, by Capt. Lachouque, of the geographical service of the French army. It is of the year 49 B. C., and recalls one of the most dramatic epochs of Roman history. The personages named in it have been made familiar by Cicero, Lucan, Appian, and especially by Cæsar, who speaks of them at length. It refers to the putting into a state of defence of Curubis (now Kourba) at a time when it was in the hands of Pompey's followers, and when they were expecting an attack from a force landed from Cæsar's fleet. The inscription gives a quite new military term, *posteicus*, a word hitherto unknown. It means either some military work of inside fortification, or else a sally-port, a postern. At the same session of the Academy, M. Dieulafoy, the well-known explorer, was elected to membership.

—A first-rate treatise on Milton's prosody would be received with acclamation, but to carry it through would require a scholar of rare attainments. Besides commanding the large and bewilderingly miscellaneous "literature" of English metric, he would need a good knowledge of metrical doctrines in general and in particular of Greek, Latin, and Italian versification. It is superfluous to add that he ought to possess a good ear for rhythm, a fancy at once alert and well bridled, and the ability, if he is a musician, to remember that poetry and music, though closely allied, are not identical. With all this, he should be minutely familiar with the vocabulary and forms of sixteenth and seventeenth-century English, and should have the literature of those periods well in hand. Finally, he could not get along without some knowledge of phonetics. For such a treatise as a scholar of these proportions might prepare we have doubtless long to wait. Meantime Mr. Robert Bridges has drawn up a handy manual called 'Milton's Prosody' (Oxford: Clarendon Press; New York: Macmillan) which is not without its uses. Mr. Bridges rates his qualifications very modestly, and, in truth, he is far from well acquainted with several indispensable matters. He has made no extensive study of the work done by his predecessors in the history and the theory of English metre; his material is incomplete; he has curious notions of phonetics, or at least of the proper way in which to state simple phonetic facts; he is not quite skilful as an expositor. But he has done conscientious work, so far as it goes, and he has brought out some facts of real consequence. Teachers and students will find his book useful, but none of them, we hope, will take it as gospel. Any who may be so inclined should turn at once to the section on "inversions," and see what they can make of "Which of us who beholds the bright surface" as there scanned with an ictus on *sur-*. "A very beautiful inversion," Mr. Bridges calls it. We must disagree with him.

—Dr. Moore, whose edition of the entire text of Dante we lately noticed, gave the first of four lectures upon the 'Purgatorio' at the Taylorian Institute in Oxford, on February 5. His chief topic was the consistent view of expiation and purgation—under the influence of warning and inspiring examples, with the aid of the promises in Holy Writ, and by recourse to the offices of the Church breviary—embodied by Dante in the seventeen cantos (x–xxvii.) which describe the seven ledges of the mountain of purgation, upon each one of which is expiated one of the seven deadly sins. The dictum of the ancients that virtue is simple and vice is manifold is illustrated in the case of Pride and Humility, for on the first ledge of Purgatory eleven representations of punished pride are pictured on the horizontal pathway where the expiating souls are walking, while only three scenes of exemplary humility are sculptured on the perpendicular face of the mountain. An intended balancing and a careful classification of the warning examples is indicated by the curious repetition of certain words at the beginning of lines 25–63 in the twelfth canto. Here the *Vedeva* beginning lines 28 and 61 should be corrected from the MSS. to *Vedea*. "Blessed are the poor in spirit" is the promise kept before the sinners on this first *girone*, and the office of the Church to which they have recourse is the Lord's Prayer. The second *girone*, where Envy is purged, has no sculptures or pictures; the rock is smooth and of the same leaden hue that covers and envelops the sinners there. Examples of charity come to them in gentle murmurs from the upper air, and a warning voice cleaving the sky like a lightning-flash or rending it as a thunderclap tells of punishment. The promise for them is implied in the text "Love them which despitefully use you," and is, "Blessed are ye when men shall revile you"; their office is the Litany of the Virgin and all the Saints. On the third *girone* the examples of mansuetude and the instances of punished anger visit the soul interiorly; they are apprehended in an ecstatic vision or momentary trance. The promise here is, "Blessed are the peacemakers," and the office of the Church is the *Agnus dei . . . dona nobis pacem*. For those on the fourth ledge, who expiate the sin of spiritual sloth (ἀκηδεια), there is no office of the Church breviary. The nature of their sin forbids it, since it has involved neglect of the church services, and the form of their expiation makes it impossible; but they have their promise in "Blessed are they that mourn," and on this *girone* two spirits in front recount improving examples of virtue, while the warning instances of *accidia* come from two laggards at the rear. Scartazzini fails to identify the Church office assigned on the seventh ledge for the expiation of lust, only because Dante uses the old form of the hymn sung on Saturday at matins and beginning *Summæ Deus clementiæ*. In the altered modern breviary, *Deus* has been changed to *parens*. Various other alterations from the more rugged and uncompromising version alone current in Dante's time have been made in this particular hymn.

—The new novel by Alphonse Daudet, 'La Petite Paroisse' (Paris: Lemerre; New York: Brentanos, Christern, Meyer Bros.), shows the same exquisite feeling and touch as the earlier works of the master, with little diminution of strength. The artist still enjoys his powers of vision and expression; the analyst retains his skill and precision; the story-teller still has the charm and attraction of old. What is perhaps more marked is the profound sympathy of Daudet for all suffering and the intense desire he feels to raise and brighten. He is an optimist in 'La Petite Paroisse,' and his kindly touch gives even Charlexis and the old duke redeeming features here and there. The book recalls 'Mme. Bovary' in some respects. The two heroines have much in common at first; Daudet's does not sink as low, and is finally restored and pardoned. The two husbands are not unlike, but Daudet makes his rage with jealousy and suffer till cured—a stronger man in some respects, yet not so pathetic a figure as Flaubert's. The book also recalls the plays of Dumas *fils*, and the terrible conclusion to which that inflexibly logical writer comes in the discussion of the punishment of the guilty wife. But Daudet's whole book breathes the spirit of forgiveness and peace, of tender mercy and uplifting grace, and in so much is more strengthening and elevating than all the younger Dumas's brilliant work. The story is a simple one, the fall and redemp-

tion of a married woman, tyrannized over by a despotic, narrow-minded mother-in-law. It is told with all the wondrous grace and poetry which are Daudet's special gifts, in that sunny French of which he possesses the secret, full of delicate suggestiveness of tint and color. No more than 'Mme. Bovary' does it make sin alluring, but it lacks, happily, the cruel impassibility and bitter vividness of Flaubert's famous book.

—The death of Francis II., sometime King of Naples, gave a fine occasion to the Parisian interviewer to pay a visit to M. Daudet. It recalled the 'Rois en exil,' since the protagonist of that admirable novel, Christian II. of Illyria, has been generally supposed to be not much more than Francis in a light disguise. The resemblance was less close than that, Daudet says. Francis served him in a general way as a model, but the figure of Christian was very far from being a portrait. It was in this case as in Daudet's other books. He does not attempt historical romance, but, on the other hand, he invents nothing. He takes his material, he says, where he finds it, a bit here and a bit there, and constructs his personages by a process of synthesis. This perhaps the acute reader has before now divined. In the case of the 'Rois en exil,' he set out to paint the fashion of a world that was passing away—perhaps it is quite gone since he wrote—the world of a court that surrounded with middle-age etiquette the throne of an anointed king. His task was to watch the clash of these old fashions with the freer ways of modern life. For this he wanted a king much less austere than Francis was, and he found him in a Spanish prince whose acquaintance with both worlds in Paris was exhaustive. From him he drew the escapades of Christian. From the life of Francis came the scene of the offer of money in exchange for an abdication of the throne, and also the episode of the siege of Ragusa, which is merely the story of the siege of Gaeta, where Francis and his queen were shut in. The original of Frédérique was a princess of Hanover. Élysée Méraut alone was drawn from the life. He really lived, and Daudet knew him years ago when he was a light of the Quartier Latin. His reputation as a student gained him the place of tutor to an Austrian prince, and he went, very young, to Vienna. There the sight of the decadence of a royal race, and of the principle of the royal divine right, in which he had been a passionate, blind believer, soon disgusted him, and he came back, disillusioned, to die in Paris. Élysée Méraut is the one figure in the 'Rois en exil' who truly lives and breathes; and it might be worth while to read the novel over again, in the light of Daudet's interview, with an eye to determining whether the other personages of the drama do not possess life in direct proportion as they are true to fact.

—The completed first volume of the *Euphorion*, "Zeitschrift für Literaturgeschichte" (Bamberg: Buchner), edited by Prof. Sauer of Prague University, fully justifies the hopeful view of this undertaking expressed by us after the appearance of the first number. The new review is a decided improvement upon its two predecessors, the *Vierteljahrschrift* and the *Archiv für Literaturgeschichte*, being much more comprehensive than the former and less given to mere antiquarianism than the latter. It is indeed the first noteworthy attempt at creating a thoroughly scientific organ for the study of modern German literature in its broadest aspect, *i. e.*, in connection with the whole of national development, with the leading movements in politics and society, in religion and philosophy, in music and the fine arts. The list of contributors to the first volume includes such names as Jakob Minor, Bernhard Seuffert, Erich Schmidt, Woldemar von Biedermann, Ludwig Geiger, Anton E. Schönbach, Reinhold Steig. The variety of its contents may be indicated by the fact that by the side of an article on Goethe as a scientist there is an æsthetic analysis of Schiller's "Maid of Orleans," while an essay on "Eduard Mörike and Politics" is followed by an exposition of the part taken by Herder in Lavater's 'Physiognomik,' a philological study on the figurative expression in Bismarck's letters, a disquisition upon the influence exerted by Thorwaldsen on Hebbel's artistic views, a biographical note on Klopstock's acquaintance with the composer Gluck, etc. A large space is devoted to uncommonly judicious reviews of all the more important publications on German literature of recent years, to an exhaustive bibliography, and to reports on periodical or other contributions to this field of study outside of Germany. The American report, written by Dr. Max Poll of Harvard and Prof. W. H. Rosenstengel of the University of Wisconsin, is, if we are not mistaken, the first attempt of this kind made in this country. To judge from this volume, the *Euphorion* will be an absolutely indispensable reference work for students of German literature, and no college library should be without it.

—A very serious drawback to a young man who has only a limited income and wishes to pursue his studies in north Germany or Austria, is the heavy income and communal taxes to which he is subjected. This system of extortion is rigorously applied, and often renders it quite impossible for a student who goes abroad on a small stipend or travelling fellowship to remain in Vienna, Berlin, Leipzig, Göttingen, or in any university north of the Main. It does not seem to be generally known that Bavaria pursues in this respect a more liberal and enlightened policy. About fifteen years ago a bill was introduced into the Bavarian Parliament proposing to imitate the north German States in compelling all foreign residents to pay taxes; but the project was vigorously and almost unanimously opposed by the press, and finally abandoned. The result has been that the rapid increase of the number of foreign residents in Munich has greatly promoted the prosperity of that city, while Berlin tradesmen are loudly lamenting the loss of English, and especially of American, customers, and wondering what has become of them. The fact that the lectures at the University of Munich were attended during the last semester by 3,798 persons and those at the University of Leipzig by only 2,862 is due in part at least to the same cause. It has frequently happened that graduates of American collegiate institutions have gone to Germany with the intention of pursuing special studies at Berlin and Leipzig, but, on receiving a visit from the tax commissioners, have wisely concluded to settle in Munich, where they found the advantages of instruction equally great and the drain upon their usually light purses far less.

—Those interested in postgraduate study at large will follow with interest the present deliberations of "Congregation" at Oxford (Congregation consists substantially of the 436 Masters of Arts in residence). Having committed itself some time ago to the principle of awarding degrees for research, Congregation on February 12 rejected, by a vote of 147 to 33, a group of amendments to the form of statute laid before them by a committee appointed for that purpose. These rejected amendments would have had the effect of making the proposed degrees not postgraduate, but undergraduate, since they expunged the clauses in the statute instituting the new degrees of *B. Litt.* and *B.Sc.*, and provided that the candidates under the new rules should receive the ordinary B.A. The statute under consideration admits to candidature any person not under the age of twenty-one who has taken the Oxford B.A., or has given evidence of having received a good general education. He must further have shown his fitness to enter on a course of special study or research, and have proved that his proposed course of study may be profitably pursued within the University. This admits any one holding an approved B.A. without absolutely requiring a B.A. An amendment was rejected, by a vote of 107 to 39, which required either the Oxford or some other B.A. or equivalent degree. The reasons which weighed here were that military men and others who would not naturally hold any degree would be suitable candidates, more especially in science. Upwards of forty amendments remain still to be accepted or rejected.

A PERIODICAL DICTIONARY.

A New English Dictionary on Historical Principles. Edited by Dr. James A. H. Murray. Vol. III., (1) D–Deceit, (2) Deceit–Deject. By Dr. Murray. Vol. IV., (1) F–Fang. By Henry Bradley. Oxford: Clarendon Press; New York: Macmillan. 1894, 1895.

ALL must approve the issuing of thinner sections of this great work at quarterly intervals. There is a natural impatience at the inevitably slow progress, and a desire to profit as soon as possible by what leaves the press. Unlike the serial of fiction, this has the advantage of being able to break off anywhere without forfeiting its welcome. Dr. Murray, it will be remembered, in beginning volume three, has but a gap to fill, since the second half (letter E) has already been completed by Mr. Bradley, who now pushes on in letter F and volume four, taking G also for his province, but, like a true Englishman, dropping his H—to Dr. Murray. One feels, we think, the personality of these two co-workers even while pursuing an identical method; but in our remarks we shall not attempt to separate them.

Noticeable for fulness are the articles *day*, *dead*, *face*, and *fall*, for which last, with its hundred shades, a phrase-key is provided. Etymology is baffled in the case of *damp*, whose history before 1480 is unknown, *dandle* (1530), *dandruff* (1545), *dandy* (1780), *dank* (1400), *darn*, 'to mend' (1600), *debauch*, *fad*, a dialectic form of recent adoption (1834), *fake*, used by Maginn in *Blackwood* in 1827. On the other hand, we trace *darkle* to Byron (1819); *Black Death* to Elizabeth Penrose (Mrs. Markham), who apparently introduced this name for the Great Pestilence that devastated Europe in the middle of the fourteenth century, into her History of England (1823); *decephalization* to J. D. Dana (1863); *decidua* to Hunter (1785). By the chance of reading for the Dictionary, *dander* first turns up in Haliburton's 'Sam Slick' (1837), *to take a dare* decidedly belated in Richard Harding Davis's 'Van Bibber' (1892), *darkey*, also (probably) behind time, in Dana's 'Two Years before the Mast' (1840), and *deer-lick* certainly so (1876)—

a conspicuous instance of inattention on the part of Dr. Murray's American readers. Other appearances worth noting are *daily*, the substantive for 'newspaper' (1858), *Darwinian*, referring to Erasmus D. (1804), *Davy Jones* (1751, in Smollett), *deadbeat* (1877), *deadhead* (1853, Lowell cited), *decentralization* (1846), *deforest*, in the modern sense (1880), *fair*, meaning 'tolerable' (1795, in Burke, seemingly; but the next instance is from Tyndall, 1860). *Defalcation* is first detected in Worcester's Dictionary (ed. 1846), and does not occur in Craig's (1847)—though, as the French statesman said of "job," that France hadn't the word, but Heaven knew she had the thing, so defalcations were not unknown in England before the middle of the present century. The earliest quotation for *Dago* (Spaniard, Portuguese, Italian, Spanish American) is 1888, and it is only by way of curiosity that we cull from Pickard's Life of Whittier (i., 395) these lines cited by James T. Fields in a letter to the poet (March 1, 1857):

> "And he shall say a good word for him,
> Igo and ago,
> Else may Old Nick to shoe-strings chew him,
> Iram, coram, dago."

Joel Barlow, in his 'Columbiad,' gave currency to *Fabian* in the sense of 'cunctatory,' and we are told that the latter day Fabian Society (1884) derives its name from its gradual method as opposed to immediate revolution. An English writer finds *Falstaffian* convenient no earlier than 1808; two other quotations, both American, are dated 1856 and 1880.

Greville borrowed *décolleté* from the French in 1831, in a passage which now reads queerly: "The Queen is a prude, and will not let the ladies come *décolletées* to her parties." He italicized it as a foreign word, but in 1848 Thackeray apparently used it as completely naturalized, in 'Vanity Fair.' In 1884 the *Westminster Daily Press* is cited as dropping the accent of the first *e* (decolleté). This may have been a mere carelessness at any one of three points along the line—of the writer in the *Press*, the reader for the Dictionary, or, finally, the printer; but it is interesting to notice that *debris* is placed before *débris* as the spelling of preferred usage, with choice of pronunciation debbree', day'bree, or deb'bree. Similarly, we find "*debacle*. . . . Also *débâcle*," but with an English pronunciation solely, dibbah'kl. *Faineance*, again, comes full-fledged English into Kingsley's 'Hypatia' without an accent, and with no nasality in the last syllable—like *faineancy* in Thoreau and Goldwin Smith; whereas *fainéant* (with the French pronunciation) has a divided usage not recognized in the rubric—Sir D. Carleton in 1619 writing *faineants*, Liddell in 1855 *fainéans*, Milman in the same year *fainéant*, and Pattison in 1868 *faineant*. With *faineantise* we observe the same diversity. There seems to be some ground for a generalization to the effect that scientists incline to naturalize French words by dropping the accent. Thus, the sole quotation from such a source under *ampère* has *ampere* (pron. either as in French or ăm'pair); Playfair in 1802 and Buckland in 1823 write *debacle;* Playfair (1802), Wilson (1851), and Geikie (1858) write *debris*, Murchison alone using the French form, as French. We may notice here the fact that *daguerreotype* appears from the start as a word of four syllables, the second *e* being silent; the *Athenæum*, indeed, of January 26, 1839, spoke of "the newly invented machine which is to be called the Daguerotype." The French, however, write *daguerréotype*, and those whose memories go back to the early days of this process in the United States will recall a not uncommon trace of the accented letter in a five-syllable pronunciation (-e-o-type.) Our spelling-reformers, by the way, often retort that our deformed orthography in certain cases suggests a false etymology; but how would they deal with words like *ampere* and *daguerreotype* without destroying all visible trace of the proper names historically honored in these vocables?

While on the subject of phonetics we remark that *dais*, which "died out in English about 1600, but was retained in Scotch in sense [of 'bench,' 'settle']," is, as in French, always a monosyllable "in English where retained as a living word; the dissyllabic pronunciation is a 'shot' at the word from the spelling." In this country it can but seldom be heard, though often enough met with in writing; our own experience would lead us to think the dissyllabic pronunciation the prevalent one. Where popular education is general and population scattered, there will always be "shots from the spelling." This more than anything else, perhaps, tends to differentiate our American speech from the English. Dawnt is Dr. Murray's only recognized pronunciation for *daunt*, and it may well be the most common in America, particularly at the West, where one even hears dănt; but we should say that dahnt was the rule with people of culture at the East. *Decō'rous* (or *dĕ'corous*), we are told, is not very frequent colloquially in England, and the same holds good with us. In *decrescendo*, as in *crescendo*, *sc* is given solely the sound of *sh*, in the Italian fashion; we should think it hardly the rule in this country even among the cultivated, and for poetic use the *ss* of the standard English pronunciation of Latin seems the more desirable. In England, *falcon* preferably has the *l* sounded, and it appears singular that this should not hold with *falconer* (faw'koner or faw'kner only).

If we turn now to definitions, we notice that our winged (devil's-) *darning-needle* is lost sight of under that word, though we may look to find it under *devil*. For *dalles* we regret that this note by Dr. Elliott Coues, in his edition of Lewis & Clark (iii., 954 *n*), was not available. He is speaking of the famous gorge of the Columbia River, but the term is generic in the Far West:

> "As a word, 'dalles' is a French plural, the English of which is flagstones, such as we lay down for a sidewalk along a street. One may even hear of 'those dalles,' *i. e.*, flat rocks in the river serving for stepping-stones. 'Dalles' are also the characteristic and celebrated columnar basaltic rock formations through which the river passes for many miles. 'Dalles' are likewise the course of the river through such formations, and the river itself during such courses, *i. e.*, the river runs through 'dalles,' and is 'dalles' in running through them. In this sense there are various 'dalles' on the Columbia; the Cascades are 'dalles,' etc."

None of the definitions of *dead-lift*, unless it be 'sheer lift,' covers our familiar sense of a lift of a dead-weight, without any advantage of momentum or leverage. *Deadline* is too restrictedly defined as a line drawn *around* a military prison, as the citation from Lossing shows: "Seventeen feet from the *inner* stockade was the 'deadline.'" Under *facetiæ* we discover no allusion to booksellers' euphemistic employment of the word in their catalogues as a classification for pornographic literature. Purists who grudge the English language a synonym for trustworthy, will be pained to meet this under *faithful:* "also, of things: Reliable." The same class, who from time to time inveigh against the absurdity of the phrase "to a degree," meaning 'to an undefined, but considerable or serious, extent; extremely, seriously,' may learn that it goes back to 1721, and was handed down by Sheridan (1775) and Carlyle (1865).

It remains to say a few words about the illustrative examples. Milton's "sad occasion dear" is duly appealed to for the second sense of *dear*, now wholly archaic, of 'hard, severe, heavy, grievous, fell, dire'; but we search in vain for the line from the same poem, "Fame is the spur," under *fame*, nor do we discover any niche of definition for "to my *fancied* sight" in Milton's sonnet to his dead wife. We miss, under *fancy*, Emerson's "Fancy departs, no more invent"—a real definition. Under the plural of *decay*, we wish for Lowell's line in his sonnet to Jeffries Wyman, "That such a man could spring from our decays"; under *dedicate*, for Lincoln's marked use of the word in his Gettysburg address. But these last are again our own American shortcomings as readers for Dr. Murray.

MASTERPIECES OF GREEK SCULPTURE.—II.

Masterpieces of Greek Sculpture: A Series of Essays on the History of Art. By Adolph Furtwängler. Edited by Eugénie Sellers, with 19 full-page plates and 200 text illustrations. Charles Scribner's Sons. 1895.

It is necessary to explain more in detail what ascriptions the author makes, what restorations he proposes, and what bringing together of separate and far-distant fragments he has accomplished. Supreme in interest is no doubt the famous statue of the Louvre. This statue, found in the island of Melos in a niche, and accompanied by smaller pieces of sculpture, was brought to Paris during the reign of Louis XVIII. and set up in the Louvre. Its base being broken, one part of it, which bore an ascription, soon disappeared. The work before us gives as a sufficient reason for the disappearance the desire of the custodians of the Louvre, in the ignorant days before 1825, to claim Praxiteles or some other giant of renown as the author. Both arms are broken off. A very large number of proposed restorations have been made. It has been thought that the statue was that of a Muse playing on the lyre, of a Victory holding a shield on which she was writing, of a Venus looking at herself in a mirror held in the right hand and raising the left hand to the hair, of a Venus grouped with Mars, of a Venus grouped with Cupid. Perhaps thirty different proposals, all from sufficiently well-reputed artists and archæologists, might be brought together. The work before us establishes at length the originality of the inscribed part of the plinth; it also shows that the small square hole in the lost piece of the plinth, which is shown in Debay's drawing, probably received a pillar; it maintains that the left arm was raised, though not quite to the level of the shoulder, and that the hand was turned with the palm upward. There results a restoration shown on page 380, which we have described above. The inquiry is then carried on to the original type which the Melos statue reproduces, and it is found that the present statue is based upon a pure Greek type similar to that of the Aphrodite of Capua at Naples, which type is assumed to be a Skopasian type, but modified by reference to the statues of Tyche, or Deity of Good Fortune, of the island of Melos. As the whole argument fills thirty-three pages, we cannot analyze it here. It will excite the angry incredulity of those who wish

to think their favorite statue an unmatched original work. To those who are aware that the sculpturesque quality remains the same, whatever the subject may be and whencesoever it may be derived, this inquiry cannot cause annoyance, nor its result disappointment. No sculptor, in his loving study of this masterpiece of his art, will vex himself by any reference to the archæologist's discovery, or supposed discovery, of the mixed origin of its type. "Macbeth" is what it is, no matter where its author found the legend upon which it is based.

A somewhat similar inquiry is set on foot in the case of the Apollo of the Belvedere. The book before us states truly that, from the time of the suggestion that what the god had held in his left hand was (not a bow, as the people thought in the days of Lord Byron, but) an ægis, this theory has been the favored one. Being new and rather surprising, it was pleasant to believe; and it was probable enough to please the archæologists. In part this theory was based upon the bronze statuette at St. Petersburg called the Stroganoff Apollo, in the left hand of which is a crumpled some thing which is generally assumed to be the end of the ægis. Prof. Furtwängler now declares that from 1891, when he had a good chance to study the statuette, he has believed it a valueless modern work, and therefore does not interest himself further in the evidence which it might furnish. He goes straight back to inherent probabilities: "We need have no doubt whatever," it is stated on page 407, that the "Apollo with the quiver on his back held the bow in his left hand." Moreover, there was something in the right hand, and it must have been a laurel bough, or more than one, with fillets. The Apollo is then compared with the work of Leochares, the sculptor of the Halicarnassus Mausoleum; and the work is asserted to be a "careful and evidently a faithful Roman copy" of a piece of Greek work, probably a bronze, of the fourth century B. C. To know more about the original Greek statue, we are told to compare the so-called Steinhauser head in the Museum at Basle. There is then a further inquiry into the original type of the statue: it is asked when and where the idea of this Apollo, newly descended from above, ready for action, turning his head to one side and in decided movement, first took shape. The discussion here loses itself in vague suggestion. There is really nothing more to say, for no other sculptures are known which help much toward the answer sought.

The chapter on the Acropolis Temples at Athens, translated by Miss Margaret Alford, is left to the appendix and to smaller print because, as the editor says, it is "mainly of historical and topographical interest." It appears, furthermore, that the editor has made it her aim "to disengage the author's arguments from all such controversial matter as might cumber or obscure them." This is done by putting all reference to contrary theories into the notes. It is not, therefore, the author's "argument" which appears in the body of the text in this appendix, but the author's theory of the historical sequence, the separate character and uses, and the architectural peculiarities of the different temples. Only a perfectly unprejudiced writer, absolutely uncommitted to a theory of his own, and taking time to compare the different theories on this subject, point by point, could hope to show with any completeness how varied and how contradictory are the opinions of competent archæologists. The author's opinion, as simplified by the editor, may be stated as follows: There is no evidence that an older building stood on the site of the Erechtheion. The shrine of Erechtheus and Athena, "attested for the sixth century by the passages from Homer, can be no other than the great 'old temple' discovered by Dörpfeld." These passages from Homer are 'Iliad,' ii., 549, *et seq.*, and 'Odyssey,' vii., 81; it is assumed also that these two poems, or at least the passages cited, are not older than the sixth century (p. 416). This "old temple" is the peristylar temple laid down on the recent maps of the Acropolis as having stood immediately south of the present site of the Erechtheion, so that the column of its northeastern angle would have been in contact with the south wall of the later building, had they both existed together. This old temple had a double naos (or cella), the chamber to the east being that of Athena and that to the west the shrine of Erechtheus; the Erechtheion proper, or western part, having also two small chambers to the east of it. A long paragraph is devoted to a most interesting discussion of the opposing theory that the western compartments of the naos were, here and elsewhere, treasuries and nothing else. The naos of this old temple was of indefinite antiquity, the peristyle later. This old temple must have been the Hekatompedon, for the reason that no late building would have been especially esteemed on account of being a hundred feet long; moreover, the hundred-foot measurement applies to the naos or temple proper, and not to its inessential part, the portico of columns. "Hekatompedon was the official name for the whole edifice," and this building "was, until 480, the only temple of the City Goddess and her companion Erechtheus upon the citadel."

The second temple is the older Parthenon, the building whose substructures exist under the Parthenon of Pericles. Of this building nothing is really known except that it must belong to the time between 479 and 447, and that it was never finished or even nearly finished. If it was abandoned in an incomplete state, deliberately destroyed and replaced by the Parthenon of Pericles, that can only point to its having been undertaken by one party in the state and therefore obstructed and delayed by the opposite party; so that the dominating personality of Pericles and his large views found nothing but a structure just begun, unroofed and barely enclosed, as an obstacle to their own grandiose conceptions. The Parthenon of Pericles was begun in 447, with a naos made much wider than the old one, evidently for the sake of the gigantic statue of Athena which was to be placed there. This new Parthenon still included a double naos, but the whole of it was devoted to Athena. The old temple was still standing and had been restored after the Persian invasion. The worship of Erechtheus remained in the old temple, and no separate building corresponding to the present Erechtheion existed. The opisthodomos which served as the Treasury of the Confederation, was not a part of the temple, but a separate building. The building of the new Erechtheion was undertaken after the peace of Nikias (421 B. C.). This was done as a special recognition of conservative principles and the older worship of Athens, as is indicated by the worship of Athena and Erechtheus in two separate chambers of one naos. The new building was therefore a rebuilding of the old temple, which latter was destroyed, probably as soon as the new structure was sufficiently advanced to be used for worship.

With the above historical examination are combined a consideration of the meaning of the Parthenon frieze, an inquiry into the subject of the eastern pediment and of the western pediment, an attempted explanation of the different divisions of the Erechtheion structure, such as the kekropion and the pandroseion, the valuable objects preserved within this temple, and finally the Temple of Nike, to which a separate section is devoted.

The whole of this examination of the temples on the Acropolis, filling fifty-five pages, is exceptionally interesting in spite of its compactness and the immense amount of matter crowded into it. It ought to be printed in a volume by itself with larger type, with a plan agreeing in all respects with the text, and, indeed, specially prepared for the illustration of the text, and with the notes referring to other and often contrary opinions increased in number. The special value of this long examination is in its completeness and unity. As regards the separate conclusions reached, their actual value is probably very unequal. Thus, the attempt at naming the seated gods at the eastern end of the Parthenon frieze is not more successful than a dozen other explanations that have been offered, while the account of the buildings and their historical succession, which we have stated briefly, is of the highest interest. The whole essay, however, is crowded with novel views, nearly all based upon demonstration sufficient to account for them, if not to prove them, and affording a solid ground upon which to erect new theories and future conclusions.

This, in fact, is the important service that the book as a whole may be expected to render. It will serve as a point of departure. Not in our time will the last word be said in the way of controversy concerning these vexed questions of archæology. New explorations of Greek sites will teach us more than we now know about temples and their architecture. New diggings will give us Greek sculpture among which there will be here and there an original of first-rate importance, and, if the Italian authorities can be brought to the task, the uncovering of Herculaneum alone will probably give us not only Greek originals such as those found in the famous villa, but also Roman copies of masterpieces in incalculable numbers. It will be many a year, however, before this book will be superseded, or its value as a contribution to the history of Grecian art be seriously diminished. Since it is meant for readers who are not professed archæologists, one complaint is in place, namely, that the Greek passages have not their translations appended. There is a considerable and growing class of persons whom we should like to send to this book, few of whom can read these extracts in the original; they are sincere lovers of art, and many (though not enough) professional artists are among them. It is a safe statement that not one in ten of lovers and students of art who would gladly use such a book as this can read Greek with ease. It is safe to say that practically no artists can read Greek. And how easy it would have been to procure literal prose versions of the few passages quoted! Possibly, also, a glossary should be added.

Travels amongst the American Indians, their Ancient Earthworks and Temples. By Vice-Admiral Lindesay Brine. Illustrated. London: Sampson Low, Marston & Co.; New York: Charles Scribner's Sons. 8vo, pp. 422.

THE journey of which this volume is the outcome was made in 1869, and our author's

object was to examine the mounds and earthworks of the Ohio valley and the ruined temples of Guatemala and southern Mexico, with the view of determining, so far as might be, their origin. But while this was his main purpose, it is but fair to add that he was by no means neglectful of what he saw and heard in other directions. Accordingly, there are portions of the volume in which he has gathered together a number of facts which are of interest socially and politically rather than archæologically, and which for this reason will prove peculiarly attractive to the casual reader. Especially is this true of the first two or three chapters, in which we have a somewhat gossipy account of the author's observations and experiences in Boston and elsewhere in the towns and cities of the Atlantic coast. Thus, for example, basing his conclusion upon what he had seen of the effects of emancipation in the West Indies, he tells us (p. 6) that there was not much probability that the negro children who were then at school in our Southern States would ever rise to an equality with the white races (*sic*) around them. Upon this point the testimony of the Catholic missionaries among our Indians is of importance. In fact the problem is the same, whether it relates to the Indian or the negro, or whether, as is unfortunately the case at present with us, it has to do with the Indian and the negro at one and the same time. Accordingly, when these missionaries tell us (pp. 35, 111, 276, 372, etc.) that the efforts of the past three hundred years to improve the intellectual character of the tribes committed to their care have been useless, it may well teach us to look with patience upon the struggles of a people who did not enter upon the upward race until we were nearing the goal. However, be this as it may, opinions upon these and similar topics are in the nature of *obiter dicta*, and though the questions involved, relating as they do to the future of the negro and the Indian, are as important as when they were first broached, and call upon us quite as loudly for solution, yet they may be passed over without affecting the force of our author's conclusions upon subjects that came more immediately within the sphere of his inquiry.

Among these, the mound question, as it is called (including under this title the shell-heaps of Maine and the ancient mines of Wisconsin as well as the earthworks of the Ohio valley), chiefly appeals to us. It may even be said to take on an added interest, since our author (p. 387) evidently inclines to the opinion that the so-called mound-builders originally lived in the Ohio valley, and that, having been driven from that region at some time in the distant past, they moved southward and established themselves in Guatemala, where they built the immense works at Patinamit and Utatlan. He also tells us (pp. 64, 103, 382, etc.) that there was no such difference between the civilization of these mound-builders and that of the Indians who were found here when the whites first landed as would justify the inference that they belonged to different races, and hence he concludes that they were one and the same people. To this conclusion, so far as it relates to the identity of the mound-builders and the Indians of historic times, we do not object. The trend of opinion among competent investigators has been in this direction for some years past; and the recent report of Cyrus Thomas, in the publications of the Bureau of Ethnology, is so exhaustive of the subject as to render any further discussion unnecessary.

But while we are in full accord with our author's conclusion upon this point, there are a number of statements leading up to it which are not accepted, or which can be explained in a different way from that which he has adopted. For instance, so far was it from being the custom of our Indians (p. 68) to torture and kill their prisoners that it was the exception. Even among the fierce and haughty Iroquois in the heyday of their power, almost one-half of their fighting men ('Jesuit Rel.' A. D. 1660, p. 6) were adoptions; and this would have been impossible if the massacre of captives had been the rule. So, too, blue eyes and red hair among the Mandans can be satisfactorily accounted for without the intervention of the Welsh or any other pre-Columbian arrivals; and as for the squares and circles—including those that are wrongly said (pp. 99, 102) to have been erected under the direction of European surveyors—it is only necessary to call attention to the fact that our Western farmers, when fencing in their fields, rarely have the use of mathematical instruments, and that although thus handicapped, they find no difficulty in "running off" squares as large as any of those in the Ohio valley, with the aid of three straight sticks and a good eye. The circles might, perhaps, give a little more trouble, but even they are not beyond the compass of a boy with a string.

In regard to the temples, etc., of Guatemala and southern Mexico, there is not much to be said. Some of the more elaborate among them were in use when Europeans first appeared upon the scene; and, thanks to recent investigations, it is no longer necessary to invent a band of civilization-bearing refugees from Spain (p. 422) or anywhere else, in order to account for the progress of the people who built them. In fact, so radical is the change of opinion on this subject that not only is the development attained in certain favored centres, as, for example, in Mexico and Peru, believed to have been of indigenous growth, but there is a large and growing school of ethnologists who hold with Brinton ('American Race,' p. 44) that wherever there was such a centre, the advance was not monopolized by the people among whom it appeared, but was enjoyed to nearly an equal degree by neighboring tribes of different stocks. In other words, the idea that the civilization of tribes like the Aztecs and Quichés differed in kind from that of the Pueblos and the Indians that lived east of the Mississippi, is no longer entertained. Unquestionably there were differences in architecture, and perhaps in some other respects, but they were more than counterbalanced by the resemblances, and were far fewer than can be found in any of our cities. Even in those instances in which the disparity was marked, it may have been due, as Bandelier suggests, to the exigencies of another climate and of varying natural resources.

Cossack Fairy-Tales and Folk-Tales. Selected, edited, and translated by R. Nisbet Bain. London: Lawrence & Bullen; New York: Charles Scribner's Sons.

THE field of folk-lore is being more industriously worked than ever, and Mr. Bain contributes the most recent volume on that subject. It is hardly fair to say of the Ruthenian folk-tale, as the translator states in his introduction, that it "has managed, owing to favorable circumstances, to preserve far more of the fresh spontaneity and naïve simplicity of the primitive folk-tales than her more sophisticated sister, the Russian *Skazka*." The effect produced upon a person conversant with Russian folk-tales by the perusal of the majority of the stories in this volume is, that they are more or less familiar, not only in general outlines, but in definite incidents and phrases. While it might be difficult or impossible to point out a perfect mate in the tales of Great Russia to any one of these tales of Little Russia, it is nevertheless a fact that the latter are annoyingly reminiscent. They even contain passages and incidents which are parallel to or identical with passages and incidents in the *byliny*, or epic songs. The Great Russian tales may have been derived from these Little Russian forms, like the Epic Songs of the Kieff Cycle, which are no longer known in the land of their birth, but are still handed down by oral tradition among the peasants of the far north. But it must be remembered that Novgorod the Great formed another cradle of original folk-lore in the Northwest, and that Kieff was settled by colonists from Novgorod.

The Great Russian tales and epics are no more "sophisticated" than those which are presented to us here, though the latter will always seem less sophisticated in the original because of the piquancy and soft mellowness of the dialect in which they are written. Again, while they are, as a rule, no doubt of great antiquity, they have not escaped the intrusion of modern foreign elements, such as that in "The Wondrous Story of Ivan Golik and the Serpents." Ivan is cast into the sea and is swallowed by a great whale-fish, in whose maw he finds wagons containing tobacco-pipes and tobacco, which he uses until the whale feels uncomfortable and swims ashore, when Ivan is rescued. While this Jonah incident may have been introduced and improved upon in very early times, the tobacco interpolation cannot date back further than the seventeenth century, at which time the plant was introduced in Russia.

In "The Vampire and St. Michael" we have the original of Gogol's famous story, "Vy." It must be confessed that the original is far more racy and delightful than the modernized version which Gogol published many years before an attempt had been made to collect the Cossack legends of his native Ukraïna. "The Sparrow and the Bush" is the counterpart of "The Old Woman who went to Market," while "The Golden Slipper" is a perfect and beautifully characteristic version of "Cinderella." The oppressed stepdaughter drives in splendor to church, not to a ball, and the fascinated Tsesarevitch secures both of her slippers by placing pitch on the spot where she is wont to stand there. The prince is represented in the illustration as sitting in church on a handsomely carved bench. The illustrator should have known that no one sits in a Russian church, and that the design of the carving is not Russian. In general, it may be said of the illustrations that they are fairly decorative, but are neither national nor characteristic.

The most thoroughly national and charming tale, "The Tsar and the Angel," narrates how the Tsar, "who was so very proud that he feared neither God nor man," waxed wroth at some words of Holy Scripture which the priest read in church. "To say such words to me," thought he—"words that I can never forget, though I grow gray-headed!" So he orders the priest to smear those words over with grease and never dare to read them again. The angel comes to the priest's assistance, and trains the haughty Tsar to be a good sovereign by making him poor and a vagabond on the face of the earth, and reigning in his stead until the Tsar has "picked up wisdom, if but little."

"The Ungrateful Children and the Old Father who went to school again" offers a very ingenious and amusing version of the state of affairs with which "King Lear" has made us familiar. The four ungrateful sons, among whom the old man has divided his property during his lifetime, shirk the duty of taking care of him, and decide to send him to school, though he has never learned his letters, because "there will be a bench for him to sit upon there, and he can take something to eat in his knapsack." The aged father cleverly outwits them, and makes them care for him until he dies. The only tragedy is furnished by the sons' wrath and disappointment after his death, and the comedy by the comment of their neighbors: "You see, he learned something at school after all! He was a long time before he *began* learning, but better late than never. It appears to us 'twas a right good school you sent him to."

The translation is spirited and good. The book is entertaining and valuable. Nevertheless, it is surprisingly lacking in the poetry which one would expect from a race so rich in poetical ballads, and which undoubtedly originated the majority of the deeply poetical epic songs. The tales are greatly inferior in poetry, invention, wit, and literary quality to the Esthonian Folk-Tales recently reviewed in these columns.

Papers and Notes on the Glacial Geology of Great Britain and Ireland. By the late Henry Carvill Lewis, M.A., F.G.S., edited from his unpublished MSS. by Henry W. Crosskey, LL.D., F.G.S. Longmans, Green & Co. 1894.

No single epoch in geology has been the subject of more study and speculation than the glacial period in Great Britain. There were first recognized the traces of a former ice invasion of the land, and it was from British geologists, as well as from Agassiz, that Americans took their first lessons in glacial geology. It is therefore somewhat singular, and at first sight paradoxical, that from an American geologist, and a very young one at that, there should come the first comprehensive and rational explanation of a multitude of glacial phenomena that have been for years in controversy among British glacialists, and that his views should meet such general acceptance among English geologists that one of their number was willing to edit his posthumous manuscripts.

The scientific career of the young Philadelphian, Prof. H. Carvill Lewis, was a very brief but brilliant one, and his early death was a distinct loss to science. After completing his studies of the great terminal moraine of the North American ice sheet where it crosses the mountains and valleys of Pennsylvania, he was seized with a desire to study similar phenomena in the smaller area of Great Britain, where he would have the benefit of detailed maps and of the observations of a host of trained geologists who had preceded him. He found these observations recorded in over 2,000 articles, the authors of no two of which were entirely in accord as to the proper interpretation of the phenomena observed. The thoroughness of his work is testified to by the fact that, after spending some time in the field with various English geologists, one of them remarked to him that he knew more about the subject than they did themselves. He spent considerable time in Europe, part of which was occupied in the study of petrography under German masters, and resulted in a paper on the origin of the South African diamond deduced from microscopical study of specimens from the Kimberley mines, which excited great interest throughout the scientific world, and met with almost universal acceptation as a good working hypothesis. He had gathered most of the material necessary for a proposed work on the glaciation of the British Isles when he was taken down by typhoid fever on his last voyage to England, and died a few days after his landing at Liverpool.

His last request to his devoted wife, who had accompanied him on all his geological excursions, was that his friend Dr. Crosskey would prepare this material for the press. Only a geologist can appreciate the arduousness and delicacy of such a task as the working up of the field-notes of a fellow geologist, and he can best understand why the editor has published the greater part of the material in the unfinished form in which it stood in Prof. Lewis's note-books. The resulting volume is in consequence perhaps less interesting to the general reader, but it is invaluable to the geologist or geological student, as showing the methods by which one of the best geological minds of the modern school arrives at its conclusions, and with what completeness field-notes may be taken. Dr. Crosskey does not subscribe to all of Prof. Lewis's deductions, and it is possible the latter might have found occasion to modify them to some extent after further investigation; but in the main they present the most plausible interpretation of the salient features of British glaciology.

The Latin Language: An Historical Account of Latin Sounds, Stems, and Flexions. By W. M. Lindsay, Fellow of Jesus College, Oxford. Oxford: Clarendon Press; New York: Macmillan & Co. 1894.

THERE was a time, not so very long ago, when it was the fashion for scholars in this country to fancy that little if anything was to be learned in classical studies from the English. This idea, carried to an extreme though it was, our transatlantic friends partly deserved, and in it they were partly the victims of that prejudice against things English which, arising at an early time, was at its fiercest, perhaps, during and just after our civil war. It was deserved because the proverbial insularity of the Englishman apparently shut him off from all that was being done by German philologians—work that Americans were quick to appreciate—while Porson's famous epigram,

> "The Germans at Greek
> Are sadly to seek,"

saved over from a former generation and used after it had grown stale, seems to have expressed pretty well the average British classical scholar's feelings about the Teutons.

But it is a pity to suppose, as many still do, that the English have not outlived this superstition, or to go on fencing one's self out from the fruits of British scholarship whether grafted on German trunk or springing independent from the soil. The folly of slavishness to such prejudice is apparent when one thinks of the names (not to go further back) of Jowett, Blaydes, Jebb, Sandys, Butcher, and Campbell among Greek scholars, of Munro, Nettleship, Sellar, Ellis, Furneaux, and Mayor among the Latins, of archæologists like Gardner, Head, and Miss Harrison, of the historian Freeman, and of a host of the unfamiliar. And in narrower fields activity is hardly less, for whether or no we agree with the conclusions of writings like those of Haigh on the theatre, of Roberts on epigraphy, and of Monro, whose book on the modes of Greek music was lately reviewed in these columns, yet their words are at least always inspiring of thought, and, together with translations of indispensable works such as Teuffel's and, above all, Brugmann's, they show that ignorance of what is doing abroad can no longer be charged against our cousins of England. And now comes an Englishman who is the first since Corssen to give us a book "devoted to a separate investigation by comparative philological methods of the Latin language, its declensions, its conjugations, its formations of the various parts of speech, and the changes of its pronunciation and orthography."

The partial table of authorities quoted by Mr. Lindsay shows clearly enough that there is little that is "insular" about him. Among them German writings are in a strong majority, but we note also many names that are French, Italian, Greek, English, and even (confusion to Sydney Smith!) American. And the author of this volume of 650 pages laments that the comparatively backward state of our knowledge of Oscan, Umbrian, and Pelignian has prevented him from making it longer by considering more fully than he has done the relations of these languages to the Latin. The merest glance over the pages shows that we have here a thesaurus of information which is sure to be of the greatest value—"no prize composition to be heard and forgotten," but a work which will long be as useful to Latin scholars as Prof. Smyth's 'Dialects' is to be to the Greeks.

There are ten chapters in the book, on the following main subjects: The alphabet (12 pages), pronunciation (133), accentuation (48), Latin representations of Indo European sounds (96), formation of noun and adjective stems (49), declensions, etc. (54), pronouns (31), the verb (94), adverbs and prepositions (47), conjunctions and interjections (20). These are also subdivided into sections. The whole swarms with references to the ancient and modern sources, so that if one is not inclined to agree with Mr. Lindsay on a point of doctrine, he may search the appropriate scripture for himself. This we shall leave to the discretion of readers, for obviously it would be unfair to the author to pick out here and there points on which we chance to disagree with him and to hold them up to criticism. We all have our little fads, and in no branch of philology do we hug them closer than in the very subjects which Mr. Lindsay has treated. A book of this sort can be thoroughly tested only by long thumbing, and not by one or two readings. That this one will stand the test and commend itself as an indispensable handbook, seems at present no matter for doubt. To those who wish to try Mr. Lindsay in point of clearness and method of statement, we commend what he has to say on hidden quantity, double consonants, syllabication, position, and the nature of Latin accent.

Old and New Unitarian Belief. By John White Chadwick. Boston: Geo. H. Ellis. 1894. Pp. xii, 246.

THE series of nine lectures here gathered into a volume are well worthy of preservation and of the attention of a larger public than Mr. Chadwick's Brooklyn congregation, for which most of them were originally prepared. The author belongs to the more radical wing of the Unitarian body, though he expresses it as his judgment that "it may well be doubted whether any Protestant sect is so well agreed at present on the main lines of its belief and

faith as 'the unsectarian sect called Unitarians.'" He cordially accepts the claims of modern Biblical criticism in their extremer forms; he frankly rejects all supernaturalistic conceptions, though he denies with equal positiveness the validity of the assertions of the pure materialist. In Mr. Chadwick's opinion, "before the century completes its round, the pure humanity of Jesus will be as generally received among us [Unitarians] as the unity of God." And this "pure humanity" implies no thought of perfection. The author's hope of immortality draws its strength not merely from the natural cravings of the human heart, but from "the scientific doctrine of the persistency of force," the "doctrine of correlated growth," and "the Darwinian doctrine of the survival of the fittest." His "great salvation" is "salvation by character."

Mr. Chadwick's affection for Parker and his school is conspicuous; but he takes his readers into his confidence as to his own spiritual development:

"I remember well enough how hard it was for me to give up the supernaturalist position. Body and soul seemed parting company. But I remember with much sadder self-compassion the agony of mind and heart when I could not maintain any longer the cause of Transcendentalism as formulated by Theodore Parker, or prophesy any more in its name. But from out the darkness there came hands that pluck ed me out of the horrible pit and miry clay, and set my feet upon a rock; and I found a new song in my mouth.

"It was the development of the scientific spirit that made such a change come o'er the spirit of our dream. . . . I think I am not wrong in my imagination that for many Unitarians of the more thoughtful kind there was a period of thick darkness somewhere along from 1860 to 1880, sooner or later as the individual was quick or slow to recognize the force of the scientific criticism on both the supernaturalist and the Transcendentalist positions."

Yet this exposition of more radical Unitarian thought is not the most valuable feature of these lectures for the general reader. Were it so, they would naturally call for review in the religious journals rather than in the *Nation*. Mr. Chadwick's conclusions will not command the assent of all who bear the Unitarian name—a fact which he frankly recognizes; they will certainly not meet the approval of the great majority of the religious scholars of America. But Mr Chadwick's volume has the merit of giving the best popular history of Unitarian doctrine that has come to our notice. It is not, like the work of Dr. J. H. Allen, recently reviewed in these columns, a sketch of the Unitarian movement as a whole, but a presentation of unfolding Unitarian thought regarding the cardinal principles of the Christian faith. The author, positive as he is in the expression of his own opinions, has recognized this clearly as the main aim of his volume:

"If there is one thing which I hope my book will do over and above all others, it is that it may furnish some correction of a very general impression in the Unitarian mind that Unitarianism is 'the same yesterday, to-day, and forever.' We make much of the changes which other creeds have undergone, and sometimes think and speak as if we had ourselves been mainly influential in bringing these changes about. Something we have done, no doubt; but in the meantime the same Time Spirit which has been at work on the other creeds has been at work upon ours also, and the changes it has undergone have not been less than theirs."

In pursuance of this endeavor, and under the captions of the Doctrine of Man, Concerning God, the Bible, Christianity, Concerning Jesus, the Future Life, and the Great Salvation, Mr. Chadwick has most interestingly set forth the rapid transformations of Unitarian belief. How wide and far-reaching those changes have been, especially in the American development of this way of thinking, he makes clearly manifest.

Not the least attractive quality of Mr. Chadwick's presentation is his modesty of claim for the body to which he belongs, and his charity toward those from whom he differs:

"The common asseveration, 'I am a good Unitarian,' often means, 'I am as rigid a sectarian as you will find in any of the orthodox sects.' But there are better Unitarians, who do not think that we have all the truth there is with us, nor all the goodness, who believe in our ideas, and still more in our principles, and would fain give them freest course, but who are not anxious by what name they shall be called, and whose hope is for an ever-livelier sympathy among all Christian sects and all the great religions of the world."

Altogether Mr. Chadwick has given us a valuable as well as a very readable treatise. An index is perhaps not to be expected in a collection of what were originally lectures, but had one been added, the usefulness of the volume would have been decidedly enhanced.

BOOKS OF THE WEEK.

A Book of Words. London: A. Constable & Co.
Baumbach, Rudolf. Frau Holde: Ein Gedicht. Henry Holt & Co. 25 cents.
Black, H. C. Handbook of American Constitutional Law. St. Paul: West Publishing Co. $3.75.
Brinton, Prof. D. G. A Primer of Mayan Hieroglyphics. Boston: Ginn & Co. $1.20.
Brooks, F. E. Old Ace, and Other Poems. Cassell. $1.
Brown, H. F. John Addington Symonds: A biography. 2 vols. Scribners. $12.50.
Chamisso, Adelbert von. Peter Schlemihl's Wundersame Geschichte. Henry Holt & Co. 25 cents.
Davenport, B. R. "Uncle Sam's" Cabins: A Story of American Life. Mascot Publishing Co. 50 cents.
Gabillot, C. Hubert Robert et son Temps. [Les Artistes Célèbres.] Paris: *L'Art*.
Geikie, Cunningham. New Testament Hours: The Apostles, their Lives and Letters. James Pott & Co. $1.50.
Gibbs, M. B. Military Career of Napoleon the Great. Chicago: The Werner Co.
Graham, Margaret C. Stories of the Foot-Hills. Boston: Houghton, Mifflin & Co. $1.25.
Grinnell, Laurence. The Brehon Laws: A Legal Handbook. London: Unwin; New York: Scribners. $2.40.
Guyau, J. M. Pages Choisies des Grands Ecrivains. Paris: Armand Colin & Cie.
Hatzfeld, Prof. Adolphe, Darmesteter, Prof. Arsène, and Thomas, Prof. Antoine. Dictionnaire Général de la Langue Française. A—F. Paris: Delagrave.
Haycraft, Prof. J. B. Darwinism and Race Progress. London: Sonnenschein; New York: Scribners. $1.
Hill, Hilton. His Egyptian Wife. Home Book Co. $1.
Leach, Orlando. The State and Local Government of New York. Revised ed. Leach, Shewell & Sanborn. 35 cents.
Mercier, Rev. Alexander G. He being Dead yet Speaketh, and Other Sermons. Randolph. $1.50.
Mirmont, H. de la Ville de. De Ansonii Mosella. Paris: Hachette.
Mirmont, H. de la Ville de. La Mythologie et les Dieux. Apollonius de Rhodes et Virgile. Paris: Hachette.
Pierson, Rev. A. T. Life-Power. F. H. Revell Co. $1.
Renan, Ernest. History of the People of Israel from the Rule of the Persians to that of the Greeks. Boston: Roberts Bros. $2.50.
Rogers, Alexander. The Rání of Jhánsi; or, The Widowed Queen. London: A. Constable & Co.
Roofer, Roof. The Fencing Girl: A London New Soul. London: Gay & Bird.
Street, G. S. Episodes. Merriam Co. 75 cents.
Tower, Charlemagne, Jr. The Marquise de La Fayette in the American Revolution. 2 vols. Philadelphia: J. B. Lippincott Co.
Tyrrell, Prof. R. Y. Latin Poetry: Lectures Delivered in 1893 in the Johns Hopkins University. Boston: Houghton, Mifflin & Co. $1.50.
Venable, W. H. Poems of William Haines Lyttle. With Memoir. Cincinnati: Robert Clarke Co. $1.25.
Voice, Speech and Gesture: A Practical Handbook to the Elocutionary Art. Putnams. $3.
Volkmann, Richard von. Kleine Geschichten. Boston: D. C. Heath & Co. 30 cents.
Warren, Prof F. M. A History of the Novel Previous to the Seventeenth Century. Henry Holt & Co. $1.75.
Watkins, M. C. American Literature. [Literature Primers.] American Book Co. 35 cents.
Whitney, Prof. W. D., and Marian P. An Introductory German Reader. Henry Holt & Co. $1.
Willard, J. A. Half a Century with Judges and Lawyers. Boston: Houghton, Mifflin & Co. $1.25.
Wilmott, A. The Story of the Expansion of Southern Africa. London: Unwin; New York: Putnams. $2.
Wise, Lieut. H. A. Captain Brand of the Schooner *Centipede*. M. J. Ivers & Co. 25 cents.
Yeats, S. L. The Honor of Savelli: A Romance. Appletons.

MARCH
EDUCATIONAL REVIEW.

REPORT OF THE COMMITTEE OF FIFTEEN Appointed by the Department of Superintendence of the National Educational Association at Boston, Mass., February, 1893. Submitted at Cleveland, O., February 19–21, 1895.

1. On the Training of Teachers—Horace S. Tarbell (Chairma), Edward Brooks, Thomas M. Balliet, Newton C. Dougherty, and Oscar H. Cooper.

2. On the Correlation of Studies in Elementary Education—William T. Harris (Chairman), James M. Greenwood, Charles B. Gilbert, Lewis H. Jones, and William H Maxwell.

3. On the Organization of City School Systems—Andrew S. Draper (Chairman), Edwin P. Seaver, Albert G. Lane, Addison B. Poland, and W. B. Powell.

$3.00 a year (monthly excepting July and August); 35 cents a number.

HENRY HOLT & CO., N. Y.

Letters of Credit. We buy and sell bills of exchange on and make Cable Transfers of money to Europe, Australia, and the West Indies: also make collections and issue Commercial and Travellers' Credits, available in all parts of the world.
Brown Brothers & Co., Bankers,

The Nation.

NEW YORK, THURSDAY, MARCH 7, 1895.

The Week.

THERE is a vast deal of satisfaction that Congress has at last adjourned, albeit tempered by the reflection that the meeting of the next one cannot be postponed beyond the first Monday in December. This satisfaction is expressed in some of the State Legislatures by resolutions condemnatory of Congress and congratulating the country on its final adjournment and extinction. This method of parading our likes and dislikes before the world is unmannerly and unbecoming, because it is an official condemnation of republican government. This Congress, whatever it may have done or left undone, was elected by the people. It could not possibly rest under severer censure than that which was visited upon the Reed-McKinley Congress in the elections of 1890. There is no assurance that the next Congress may not go out of office under as black a cloud as this one. If that should prove to be the case, it would be but following a fresh precedent if all the Democratic Legislatures in the country and all the Populist ones, if any, should pass resolutions congratulating themselves on the deliverance of the country from the torment of such a Congress. And so in course of time the "effete monarchies of the Old World" would expect to see our federal Government put in the pillory, figuratively speaking, rotten-egged, or tarred and feathered by the State governments every two years. This would not be a pleasing spectacle for George Washington if he could be a witness of it one hundred years after the delivery of his Farewell Address.

The action of Congress on the proposed silver conference is embraced in a clause of the sundry civil appropriation bill which provides that "whenever the President of the United States shall determine that the United States should be represented at any international conference called with a view to secure, internationally, a fixity of relative value between gold and silver, as money, by means of a common ratio between those metals, with free mintage at such ratio, the United States shall be represented at such conference by nine delegates." Three of the delegates are to be appointed by the President, three by the Senate, and three by the Speaker of the House, the last to be chosen from members of the Fifty-third Congress who have been reëlected to the Fifty-fourth. The question of sending or not sending delegates is to be determined by the President. Under the terms of the clause he would not be at liberty to send delegates to a conference called, like that of Brussels, merely for the purpose of "considering what measures, if any, could be taken to increase the use of silver in the currency systems of nations." Such a conference would not come within the terms of the law, which contemplates nothing short of free coinage under an international agreement. Nothing less than this would justify the payment of the $100,000 appropriated for the expenses. The terms of the law thus put upon the Government calling the conference the onus of calling it for that specific purpose. Since such a call is a virtual pledge that the country making it will agree to bimetallism at some ratio, the chances of any call whatever being issued are lessened rather than increased, for not even Germany is prepared to make the announcement beforehand that she will change her monetary system in any event. As regards England, it is plain that she is not ready to join in such a call, even if she should respond to one sent out by Germany. The chance of any conference being held is, therefore, only middling. It is a noticeable fact that the extreme silverites, of whom Senator Stewart is the type, are opposed to a new conference altogether. What they want is not bimetallism, but the single silver standard.

Senator Stewart's protest against going into another international conference to do something for silver is wholly justifiable. He knows from long and sad experience that, as he says, such conferences never result in anything but a "fresh blow to silver." How, as he pathetically inquires, can you hope to get anything by conferring with shameless gold-bug powers like Great Britain and Germany, who begin by saying that they will not change their monetary systems, no matter what other nations do? He sees clearly that nothing will come of it all but long and dreary disquisitions on silver, which his soul loathes, platonic resolves that something ought to be done, but that it is beyond the wit of mortal man to say what, and at the end a lot of disgusted delegates returning home to take up the burden of life again. In fact, the Populists are the only ones who think straight and see with an open vision on this subject. Stewart and Allen and Peffer and Martin and Kyle are really the only consistent friends of silver left. It cuts them to the heart to see the innocent Wolcott fooled, or pretending that he is fooled, by this international humbug. But they at least will maintain the true faith. And who can doubt that they will win in the end? It used to be said, Athanasius *contra mundum*, and we all know who won in that contest. In the great modern struggle, Pefferus *contra aurum*, the chances are all in favor of the party of the first part, and Wolcott and the other compromisers and international-conference men will take the contemptible place of the Arians in history.

The supporters of McKinley, Reed, and Harrison in the next Republican national convention will probably succeed so far as to neutralize and efface each other, while some candidate who has not excited so much bad feeling will carry off the prize. Reed has lost ground in the East since he played fast and loose with the bond sale and the gold standard, but it would be a mistake if this should prove a gain to McKinley, whose record on the silver question is much worse. In a speech in Toledo, April 12, 1891, McKinley attacked President Cleveland (he was ex-President at that time) in the following words:

> "During all of his [Cleveland's] years at the head of the Government, he was dishonoring one of our precious metals, one of our own great products; discrediting silver and enhancing the price of gold. He endeavored, even before his inauguration to office, to stop the coinage of silver dollars, and afterwards, and to the end of his Administration, persistently used his power to that end. He was determined to contract the circulating medium and demonetize one of the coins of commerce, limit the volume of money among the people, make money scarce, and therefore dear. He would have increased the value of money and diminished the value of everything else—money the master, everything else its servant."

The Scholar in Politics did a great deal of "the work of the world," with much "dust and sweat," on the naval appropriation bill in the Senate. He gave a rapid survey of foreign politics, showing how Russia is gaining strength in the Orient and is sure to come into collision with England sooner or later, and how France will join Russia in that conflict on account of her jealousy of English influence in Egypt. There is another impelling force pushing France into war. Socialism is growing so rapidly that the conservative element can find protection only by throwing itself again into the arms of the man on horseback. "When that is done," says the Scholar, "war is inevitable and instant." How does that affect us? The Scholar has an answer ready: "We are a part of the European balance of power. As in 1778 and 1812, we shall find ourselves in practical alliance with Russia and France, and in practical hostility to England and the Dreibund." Some people may remember, although the Scholar has forgotten, that in 1812 Russia and France were in deadly conflict, and that Russia was so friendly to us that she offered herself as a mediator between us and England, and actually took the first steps that led to the treaty of Ghent. No trifle of that sort stops the Scholar. Having got us into alliance with Russia and France and into hostilities with England, Germany, Austria, and Italy, he goes on to explain why

we are in a position so far removed from the tenets of Washington's Farewell Address. "It is because, so long as Great Britain remains a power on this continent, in Canada, we can be nowhere else." There is some mystery about this which the Scholar ought to explain. In 1854-'55, England was actually engaged in war with Russia, and she was "a power on this continent in Canada," yet we did not find any inconvenience in that fact. "Her fortifications threaten us," says Mr. Lodge; "Halifax is a menace to us, Bermuda is a menace to us, and so is Kingston, so is the one opposite the isthmus." Which one, Fiji or St. Lucia? "So is Esquimault on the other side; and the Canadian Pacific Road, built by the Government, cannot be justified by any commercial principle."

We think that the Scholar has made one mistake in this array of reasons why we should have a navy large enough to fight somebody. When he puts us in the attitude of siding with France against Germany in the next great European conflict, he does not reflect sufficiently on the fact that the German vote is much larger than the French vote. Indeed, there is practically no French vote in this country worth catering to. Even the English vote is larger than the French vote. So, too, it seems to us that the Scholar has overestimated the menace of Halifax and the other places he speaks of, and has misconceived the principles upon which the Canadian Pacific Railroad exists. If Halifax is a menace to us, we are a menace to Halifax. So we are even as to that. That the Canadian Pacific Railroad was not built on commercial principles seems to be acknowledged in London since the passing of its March dividend, but on the other hand we have at least four Pacific railroads in the same category. So we are more than even with Great Britain in that particular. Perhaps that is a good reason in itself for enlarging our navy. However that may be, we feel assured that when Mr. Lodge's speech is read in the cabinets of the Old World, they will be aware of the existence of a new European power with which they must reckon, and will no longer consider themselves sheltered on the West by George Washington's Farewell Address.

Some of the leading Republican Senators (Sherman, Platt, and Hoar) expressed regret on Saturday that the appropriation of $425,000 for the Bering Sea claims had been rejected by the House. Mr. Sherman feared that the effect would be to bring the principle of international arbitration into disrepute. Mr. Hoar apprehended that it would have this effect, and also that the settlement of the claims under a foreign umpire would cost more than $425,000. Senator Morgan, the man who is always wrong, brought forward the odd proposal that Congress should now investigate the separate claims, although the Paris tribunal of which he was a member provided an entirely different method of procedure. Mr. Morgan also said (as did Mr. Hitt in the House) that most of the claims were those of "rascally Americans who were violating the laws of their own country." The truth is, that seal-fishing in Bering Sea beyond the three-mile limit was not forbidden by law to either Americans or foreigners, and that when an attempt was made in 1891 to pass such a law, Senator Morgan himself opposed it and caused it to be rejected. The defeat of this appropriation is, we think, the most humiliating act of the present Congress, surpassing the vote on the gold-bond bill, because the latter concerns only ourselves, while the former affects our standing among nations. It is true that we had our election either to pay without any fuss or to make as much fuss as possible. We chose the second method, and from this time forward our single aim will be to prove that the "poachers" in Bering Sea were our own citizens, and that they are not entitled to any of the pay, although they were engaged in a lawful occupation.

Against the bill for the more effectual suppression of the lottery traffic, the lottery men had secured as their champions those two wily Senators, so confidently counted on by corporate influences, Gorman and Brice. Gorman, who so delights to play the conscientious rôle, opposed devoting to the House amendments the few minutes which a vote on them would require, on the plea that this would interfere with the appropriation bills. Senator Hoar's absence from the chamber during the night would have proved fatal to the measure; but his persistence had its reward, and in the small hours of Monday morning the bill was finally sent on its way to the President. It will seem strange to many people that express companies should oppose a measure of this kind at all, or that the business which the lottery companies give the express offices should be important enough to fight for. This business, however, is much larger than is generally understood. Indeed, if a canvass could be made of the persons at the thousands of smaller railroad stations throughout the country who combine the duties of railroad and express agents, it would be found that very few of them have not been approached by the lottery men with the offer of an agency, and that large numbers of them have consented so to act. If the new law puts a stop to this branch of the business, the lottery people will have to be very cunning to devise some substitute for it.

The accession of Mr. W. L. Wilson to President Cleveland's cabinet is a cause for genuine public congratulation. He deserves in a preëminent degree the title of "the scholar in politics," for his career in the House has shown him to be the possessor of a trained and philosophic mind, which he has applied to the problems of government with absolute devotion and with unswerving allegiance to high ideals. No member of the House serving with him has been his equal in this respect. His speeches have been the production of a scholar and a thinker, far removed from the low plane of partisan politics, appealing directly to human reason, and based upon prolonged and intelligent study of the fruits of human experience. His absence from the House will be a distinct loss to that body, and an irreparable loss to his party's representation there, for among the old members who will remain, and among the new ones who will come in when the new Congress assembles, there is not one who gives any sign of possessing the high qualities which distinguish him. In putting him into his cabinet President Cleveland has not only spared the country the loss of his services, but has strengthened his Administration with an adviser whose counsel is certain to be of great value.

A fortnight ago the Michigan Republicans met in State convention and heartily commended the course of the Republican Congressmen from Michigan who had refused to substitute the word "gold" for "coin" in United States bonds. Upon this the few forlorn Democrats left in the State pricked up their ears and determined, if the race was to be for cheap money, to make sure of coming in first. So their convention on Thursday resolved boldly "in favor of the free and unlimited coinage of silver and gold at a ratio of 16 to 1, . . . regardless of the position of any other nation with respect thereto." It would be hard to beat that platform, but as to beating the candidates that stand upon it, that is another affair. Last year's platform of the Michigan Democrats declared "in favor of the free, unlimited coinage of silver," and the result was that they were able to elect a grand total of exactly one member of the lower house of the State Legislature. What have they against that lonely man that they want to drive even him out of public life?

There never was a party which had so much trouble with its own members as the Populists. They have never come into power in any State without speedily accusing the officials whom they had elected of "selling them out." They cannot even devise any way of getting the news straight in Populist newspapers. The "National Reform Press Association" held a convention at Kansas City the other day, and grappled with the question, "How can we get reliable telegraph news independent of the monopoly plutocratic press associations?" Several speakers ad-

vised the establishment of a news bureau with "a faithful Populist" in charge who should take the leading newspapers of the country, clip "reliable news" from their columns, and send it to the Populist papers. This was an extraordinarily sensible proposition for such an assembly, but it proved to be utterly impracticable, for nobody could meet the objection that it would be impossible to find a man who would remain "faithful to the party." A suggestion that the chairman of the national committee would be a good man to take charge of such a bureau was greeted with derision, as a number of the leaders accused him of designs to betray the Populists into the hands of a new third party. The matter was finally turned over to a committee of five, but nobody seemed to expect that they could solve the problem how to keep a Populist honest more than a few weeks.

South Carolina is to have a constitutional convention. The proposition has been mooted for years, but it remained for ex-Gov. Tillman to push the scheme through. It was at first expected that he would try to run the convention in the same high-handed way that has characterized his conduct towards all branches of the Government, but he has given the State a surprise by proposing a compromise under which the old conservative element is to be given half of the delegates. The offer seems to be made in good faith, and is accepted in the same spirit. The greatest question before the convention will be the proposed elimination of the negro vote. An effort will probably be made to follow the example of Mississippi by adopting a provision imposing what may be called a flexible educational qualification. In Mississippi a man, in order to exercise the franchise, must be either able to read the Constitution "or to understand the same when read to him, or give a reasonable interpretation thereof." This was intended to catch the black illiterate while letting the equally ignorant white slip through, and of course such a provision opens the way for fraud. Other propositions urged by the Bourbons in South Carolina for the same purpose are the imposition of a heavy poll-tax and the apportionment of school money between the two races according to the amounts of their taxes respectively, which would discriminate terribly against the blacks. Vigorous opposition, however, is made to this policy by some prominent and representative white men, an eloquent protest having recently been made by Col. John J. Dargan of Sumter, who pronounces such schemes "outrageous, disgraceful, abhorrent to every idea of liberty."

A very excellent point was made by Gov. Morton in his memorandum on the West Troy police bill, and emphasized later in his informal explanation of that memorandum. He says that the "condition of parties in November should not be taken as a criterion for the selection of officers of a merely local character several months afterwards; and candidates representing local issues should not be deprived of office while receiving more votes than any other candidates simply because they do not belong to one of the two great political parties into which the State or nation may have been divided months before." That shows up very clearly the absurdity of all bi-partisan boards which have general administrative duties. A police board equally divided between the two political parties which cast the largest vote in a national election, shuts out entirely the great body of voters who disregarded party lines in order to secure a reform municipal administration. Under a bi-partisan control of that kind, the majority of citizens who elected Mayor Strong would have no representation whatever in the Police Department, for the minute a man ceased to be a regular party man he would be ineligible to a position on the board. The Platt-Lexow plan of electing members of the board is the most extreme form of the evil which the Governor condemns, and he cannot, after this utterance, approve that plan if it shall ever reach him.

The most important bibliological event that has ever occurred in this city is the consolidation of the Astor, Tilden, and Lenox libraries, which has at length been agreed upon. The plan converts the three libraries into a great public library for the city of New York, managed by a committee of twenty-one, to which each library contributes seven members. This is the happiest possible solution of various problems. The late Mr. Astor was so convinced of the injury to the Astor Library of its association with his name and family, that he directed his son to sever all connection with it, which the son has done. The Lenox Library, valuable as its contents are, has, for some reason or other, whether distance from the centre of population, or tradition of earlier seclusion, failed to attract readers to any great extent. The history of Mr. Tilden's trust we all know. Two millions of money belonging to it await expenditure in accordance with his wishes, but no plan for turning the sum to the best account has, in spite of much deliberation on the part of the trustees, ever been agreed upon. The present scheme offers a happy deliverance from the main difficulties.

On February 3 the Swiss voters were called on by a referendum to pass upon a new law relating to the diplomatic representation of the country. Owing to the increase of emigration and the growing importance of Swiss interests abroad, it was thought desirable to appoint full consuls in place of the consular agents who alone have been employed heretofore. There was no particular opposition to this proposition, but coupled with it was another to empower the central Government to appoint ambassadors and fix their salaries without the necessity of taking a popular vote. This was repugnant to the sturdy Swiss democrats for two reasons. In the first place, they share the general feeling of a democracy about foreign ministers, who are thought of as a lazy and useless set, paid high salaries to do nothing but practise the social graces in the great capitals of the world. In addition was the danger into which the principle of the referendum itself would be brought if so important a matter as this could be withdrawn permanently from its scope. Whatever the motives or the arguments, the opposition proved effective, and the whole measure was defeated by a vote of 222,396 to 171,732.

The ministerial crisis in Norway has, within a fortnight, entered upon a new and significant stage. The King, being in Christiania, summoned Mr. S. Nielsen, the president of the Storthing, and asked for a plain statement of the programme which the party of the Left proposed to present to the Storthing. King Oscar is said to have shown a somewhat conciliatory disposition, and the Radical leaders have met him half-way, and retreated from the position they assumed in the last Storthing in regard to the burning question of a separate consular service for Norway. They are now willing to concede the right of Sweden to discuss the question and to offer suggestions, provided the negotiations are conducted through a Norwegian ministry, chosen from the leaders of the Left. A year ago the claim was stubbornly maintained that the consular question was a distinctly Norwegian one, and must be decided by the Norwegian Government, without any interference on the part of Sweden. A mutual *rapprochement* seems thus to have taken place, and a peaceful and rational solution of the difficulty is within the pale of probability. The Government organs are beginning to reflect this changed attitude, and all talk of war is, on both sides, discountenanced. The King has during the last few days issued a manifesto, in the shape of an open letter to President Nielsen, in which he tacitly abandons his former position that Sweden can never permit the establishment of a Norwegian consular service. He emphasizes the necessity of mutual concessions, and declares that the consular programme can be carried out only if Norway will give assurance of a disposition to treat this and all other questions relating to the union in a peaceful and conciliatory spirit, which will conduce to their final settlement. The answer of the Left to this letter is also couched in cautious and temperate terms, and there is every reason for believing that the end of the long and bitter constitutional struggle is not far distant.

CONGRESSIONAL STATESMANSHIP.

THE Congress which died on Monday represents the wisdom of the Democratic party applied to the governmental problems which confront the American people. It has suffered no let or hindrance in administration. The Congress which expired four years ago to-day represented Republican wisdom applied to the same problems. In that Congress Republican policy was in control of all departments of the Government. The intervening Congress, the Fifty-second, had a divided responsibility. The questions pressing for solution upon the Fifty-first Congress were almost identical with those which the Fifty-third Congress has had to face. They were questions of revenue and finance. A dispassionate statement of the solutions adopted by the unfettered Republican Congress of 1889–'91, in comparison with those chosen by the untrammelled Democratic Congress of 1893–'95, is the only way to make a just apportionment of praise or blame, and to show the present level of congressional statesmanship irrespective of partisan considerations.

The main difficulty which met Reed's Congress on the threshold was that of the swollen revenues and the huge balance in the Treasury. Let this be stated in the words, not of a partisan opponent, but of the party's own finance minister. Secretary Windom's first annual report showed that the Treasury surplus, applicable to the purchase of bonds, would be by June 30, 1890, $163,484,042. In regard to this he said:

> "It is manifestly wrong to take money from the people for the cancellation of bonds, to the saving of only about 2 per cent. of interest, when it is worth to them perhaps three times as much in their business. It is rather through a reduction of customs receipts and internal taxes that an unnecessary accumulation of money in the Treasury should be avoided."

How this business proposition and good advice was received by the Fifty-first Congress can be stated in a word. Deliberate means to squander the surplus were chosen. The annual bill for pensions was marked up $75,000,000. In an unprecedented bounty law $10,000,000 more was disposed of. Customs duties, instead of being reduced, were increased, confessedly at the behest of their beneficiaries, and, to make sure that nothing should be left in the Treasury after Tanner and the bounty-men took their hands out of it, a tax which had existed since the foundation of the Government, and which was bringing in a revenue of $40,000,000 a year, was repealed. The net result of these dealings with the Government revenue was to bring the Treasury into great straits in the closing months of the Republican Administration. The gold reserve fell to the danger point. The available cash balance was reduced to $11,000,000, in place of $163,000,000. The secretary of the treasury said a Government loan would have to be made, and had bonds prepared for issue.

Republican wisdom, taking a turn at the currency, wrought in a sad sincerity as follows: The Fifty-first Congress inherited a vicious and onerous silver-coinage law, requiring the purchase of $2,000,000 a month of silver, and giving the option of buying $4,000,000. It was not unaware of the dangers of this law. The secretary of the treasury frankly told it that the law was a standing peril to the national finance, and that the arguments against it were "justified by the laws of trade and finance, and by the universal experience of mankind." It might have been expected that the Congress would take steps at least to diminish the evil. On the contrary, it deliberately doubled it. The secretary of the treasury was ordered to purchase 4,500,000 ounces of silver a month. This action was not excused as a necessary concession to highwaymen, but was extolled by all the accredited Republican organs as a great stroke of conservative and constructive legislation.

The Fifty-second Congress was in a state of chronic deadlock, and no assignment of responsibility can fairly be made in its case. But the Fifty-third had a free hand, and how has it dealt with the same questions of revenue and currency? As far as undoing the awful blunder of the Fifty-first Congress on the silver business is concerned, its success has been great. It has stopped the silver purchases outright and, we believe, for ever. The thing was doubtless done *malgré lui.* It was done with a fearful straining of the whole machine, but it was done. That claim on the gratitude of the American people they are not now disposed to disown, and they will be less and less disposed to disown it as time rolls by and makes more clear to them the great salvation it brought them, or made possible for them, in matters financial. But here praise must end. Congress could repeal bad legislation; it could not enact good legislation. Its action on the urgent question of the greenbacks, of banking, of Treasury certificates, of gold bonds, has been imbecility heaped on imbecility—the helpless floundering of irreconcilable factions in a quagmire.

Touching the problem of the Government's revenue, the record is a checkered one. The business panic complicated everything, so that it is as yet impossible to say how the Treasury balance between income and expenditure will stand after normal conditions have returned. But grievous sins of omission and equally grievous sins of commission must in any case be charged. A revenue of $30,000,000 from a slight increase in the tax on beer was to be had for picking it up, but was passed by. The tariff as a revenue-producing measure was lost sight of. To crown all, the income tax was snapped like a concealed trap.

We leave our readers who look on this picture and on that to say for themselves in which the shadow predominates. For ourselves we will only say that four years are too short a time for a myth to grow up, and that those who are pointing back to Reed's Congress as the golden age of congressional statesmanship would do well to wait until the memory of its doings grows less vivid. To those who object that the comparison arouses little hope for miracles of statesmanship from the next Congress, we have no comfort to offer except that it is always well to know the worst. The chief moral of all is the one forced home upon us from so many other sources, namely, that American public finance is a national disgrace, from its lack of rational system, and above all from the lack of knowledge, convictions, and courage on the part of those set to administer it.

REPRESENTATIVE GOVERNMENT IN OPERATION.

THE almost universal commendation of President Cleveland for his action in the late financial crisis has one bearing little noticed. If he was right, Congress was wrong. If he represented a sweeping popular sentiment, as multiplied evidence shows that he did, then House and Senate were in defiance of that sentiment. But those bodies, particularly the House, are the chosen representatives of public sentiment. How came it about that instead of obeying they flouted it? This is a mystery which many people have been puzzling their heads over the past month. The mystery will not appear so dense, however, if we attend (1) to the manner in which these so-called representatives are chosen, and (2) to the kind of men they are when chosen.

The theory of representative government, as laid down by Mill and other writers, is simple and beautiful. The voters in a given congressional district put their heads together, look over the field, choose out the man whom they think fittest to represent them at Washington, and send him there. He is to be no automaton, he is to be left at liberty to express his opinions if he has any, but in the great matters in issue, politically, he is to vote as the men would have him who elected him to office. If this theory were carried out in practice, it is obvious that a House of Representatives running counter to the general convictions and wishes of the people on so important a question as the national credit and currency could not be conceived of as possible.

But a little attention to the way representatives are actually chosen will help one to understand why they act as oligarchs, not representatives. They are elected by oligarchical methods. Far from the electors having free selection of their representatives, they are shut up to the narrowest possible choice—usually to a choice of evils. Their candidates are selected for them by a party which is itself an oligarchy, and are further determined by a boss or a petty committee

of that party. Take the last election in the Fourteenth District in this city. The voters were shut up to a choice between Quigg and Connelly. One boss determined one nomination and another the other. Yet, on the theory of representative government, Quigg is the spontaneous choice of the 43,000 voters—or at least of the 24,000 who voted for him; and when he runs Platt's errands, writes Platt's edicts, and votes Platt's votes, he has the might and majesty of a great electorate behind him. This is a good illustration of Representation as she represents, and helps us to understand how representatives of public opinion can oppose it. They are not real representatives, but a lot of oligarchs, chosen by oligarchs, and running the Government to suit themselves.

Especial and sufficient reason why the House of Representatives should so lamentably misrepresent the country on financial questions is to be found in the class of men who compose it. But the smallest fraction of them have any practical acquaintance with banking or trade or manufacturing. The great, the overwhelming, majority of them are lawyers. In the Fiftieth Congress, 203 members of the House were lawyers; in the Fifty-second, 200; in the last Congress there was the appalling number of 243. We say appalling, not that we have any objection to lawyers; but we have decided objections to the kind that, for the most part, get into Congress. They are the third or fifth-rate members of the profession—of the narrow-minded, cross-roads order. A "composite" biography, true in general for the great mass of them, would read about as follows, in phrases taken literally from sketches of their lives furnished by themselves to the Congressional Directory:

"Was born in 1838; worked on a farm until he was sixteen; took up the trade of blacksmithing; taught school for two years; read law with the Hon. Gabe Bouck of Minturn's Corners; was admitted to the bar in 1866; nominated for Prosecuting Attorney against the most popular man in the Republican party and triumphantly elected in 1869; held several other county offices; was never defeated; member of Forty-eighth, Fifty-first, and Fifty-third Congresses; said of him by his home paper: 'In all relations of life, as a neighbor, friend, and public official, he has been faithful to every trust, zealous as a church member, Sunday-school worker, and legislator.'"

Is it any wonder that a House dominated by men of such training and antecedents should display a certain crudity in dealing with nice questions of finance? Add in the twenty-two farmer members, who are at least as crude and hazy in their notions about the currency, and it is not surprising that the thirty-three members of the House who come from active commercial pursuits, from banking or manufacturing, can make so little impression on the great majority. The complaint is an old one. In the Forty-fifth Congress, when the House was madly rushing to repeal the resumption act, Congressman Chittenden said with perfect truth:

"We, the representatives of the people, have discussed this question of currency for more than fifteen years, during which time more than five hundred paper-money devices have been brought here. For more than five years we have devoted our energies to the interests of bankrupt speculators exclusively."

That is precisely what is to be expected from a lot of small-minded country lawyers turned politicians. For a large part of their lives they are thrown into daily contact with men who are anxious to cheat their creditors, and nothing is more natural than that they should endeavor to shape national legislation so as to enable them to do it. They come out of communities where elementary instruction in finance has never penetrated, where everybody is trying to get a little money by hook or by crook, and what more inevitable than that they should want to vote all their old friends a generous *per capita* out of the Treasury?

In the campaign of education on the finances which must come, nothing is more important than to cut down the number of lawyer-politicians in the House, and swell the numbers of true and capable representatives of the business and commerce of the country. Most of the present Congressmen who may be classed as business men come from New York and New England. The cities of the South must see to it that they do not allow themselves to be throttled by cross-roads lawyers. Party names are of little account in this matter. A leading trade journal justly says:

"The nominal politics of a real representative of a commercial and manufacturing section is a secondary consideration; practical business men of diverse political views as regards the hundred non-essentials of a political creed, are invariably in perfect accord upon questions which concern the financial credit and the commercial and industrial prosperity of the country."

It is time we had some currency legislation from Congress designed for the benefit of solvent business men instead of bankrupt speculators.

BIMETALLISM IN ENGLAND.

The English bimetallists last week brought a resolution before the House of Commons to the effect that, having regard to the recent expressions of Germany and France on the subject of the growing divergence between the values of silver and gold, the Government ought to coöperate with the Powers in the calling of an international conference. Sir William Harcourt promptly accepted the resolution, and said that England had always listened to the suggestions of friendly powers for conferences touching common interests, and would continue to do so; that no communication had been received from any quarter on this subject, but that if any should be received, it would be treated with all due courtesy. He reminded the House that the failure of the Brussels conference could not be charged to England; that Germany had preceded England in declaring that she would not change her monetary system, and that England had voted in favor of the Rothschild plan of taking steps to arrest the decline of silver, while Russia and the countries of the Latin Union had voted against it and defeated it. Thereupon the resolution was adopted without a division.

Meanwhile Germany seems to be rather backward in coming forward. The Reichstag voted, a few weeks ago, in favor of a new conference to promote bimetallism. The united commercial bodies of Germany happened to hold their annual convention shortly after this vote was taken in the Reichstag, and they, by unanimous vote, passed a resolution opposing any such movement. The Government thereupon took a position of masterly inactivity, hoping evidently that the project would "blow over." Then followed the resolution in the House of Commons, which will probably revive the spirits of the German contingent, and may compel the Government to do something. One remark of Sir William Harcourt must, nevertheless, give great uneasiness to the German chancellor, or whoever is charged with the duty of formulating the call for the conference—viz., his expression of a hope that the call would not be for the purposes of academic discussion, but would embrace definite proposals. There is nothing so repulsive to bimetallists as a definite proposal—as, for instance, to consider a coinage ratio between gold and silver. They always sheer away from this.

In the Brussels conference, for example, after the academic discussion had proceeded a certain time, Mr. Forssell of Sweden asked the American delegates what ratio they would consider the most practical and equitable, whether 15½ or 16 to 1, or a ratio nearer the market value of silver. Mr. Allison replied that the delegation had had no conference on the subject. They would, of course, prefer their own ratio of 16 to 1, but they would accept that of 15½ if it were more agreeable to those countries which had the largest amount of silver. He agreed that the question of ratio was a fundamental one, but he thought that a more important one was the question how many countries would join in a bimetallic treaty at any ratio. Mr. Forssell said that the interesting reply of Mr. Allison led him to put to the delegates of the United States a second question, viz.: What number of states would, in their opinion, be necessary to make a bimetallic treaty effective? In the way of rendering the discussion practical a reply to this question would be of great value. The reply to this question was interrupted by a speech from M. Tirard, one of the delegates of France, after which Mr. Allison said that since France was not disposed to join in any scheme which would increase her silver holdings, he thought that a reply to Mr. Forssell's query was unnecessary.

The position of France at the present time is decidedly interesting. She holds the largest stock of gold of all the na-

tions. The Bank of France alone holds $400,000,000 of this metal, and the quantity in circulation is also larger than that of any other country. Any plan of bimetallism which should expose her gold hoard to depredation by silver-producing countries would cause a chill in all her commercial veins. Upon this point M. Tirard was very emphatic in the Brussels conference. He said that France had no cause to complain of the present monetary situation, and that she did not complain. She had endeavored to come to an agreement with the United States at the conference of 1881, which was a sort of continuation of that of 1878. Later, in 1889, a monetary congress was held in Paris during the Exposition, but nothing came of it. France was the country of all others which had the largest quantity of metallic money, both gold and silver. This was due to the minute subdivision of properties and employments, which, being very small, were not adapted to the use of bank checks to the same extent as in countries where industry is more consolidated and centralized. She ceased to coin silver because she was confronted with an ever-increasing volume of that metal. Why should France permit the free coinage of silver when she was already amply provided with it? She alone possessed as much as all the other states of Europe put together. The Bank of France, he said, holds as much as all the other banks together; "consequently I have the right to say that she has quite enough."

While this is as true to-day as it was when M. Tirard uttered it, the Government is confronted by the same pressure from the agricultural class which that of Germany has to meet and to which Sir William Harcourt yielded when he accepted Mr. Everett's resolution on Tuesday week. The land-owners of all these countries are in distress by reason of the low price of wheat, and they think that the low price is due to something else than an over-supply of the article itself. A change in the money standard, they think, could not make matters worse, but might make them better. So they are pushing with all their might in all three of these countries for bimetallism. It is a very interesting situation for us. If the bimetallists should by any means carry the day, Uncle Sam is ready to supply them with silver at any ratio they may choose to adopt, and will take gold in payment if they force it upon him.

A PESSIMISTIC OUTLOOK.

THE *Journal des Économistes*, in its last issue, makes a review of the situation of the world at the close of 1894 which is terrible reading for an optimist. In the first place, it says, the expenses of government in Europe have in ten years increased 22 per cent., while the population has increased only 10 per cent. In this total the military expenses have figured as 23 per cent. of the whole, those of the United States, through its pension list, included. The public debts of Europe have been increased $5,600,000,000. In countries which have grown too restless under the taxation thus caused, such as France, Russia, Sweden, resort has been had to "conversion," or compulsory lowering of interest. Italy is on the verge of bankruptcy, and Greece is actually bankrupt. Except in England, very few articles escape taxation, and now there is a general turning towards a progressive income tax as the best mode of getting at people who already pay on everything they buy or consume. At the same time there is a strong tendency to turn over to the Government those branches of industry in which individuals now make the most money—the manufacture of tobacco and of matches, the transportation of letters and parcels, the telegraph and telephone.

On top of all this come the taxes for the protection of native industry. In France, in Italy, in Spain, and in Germany these taxes have all been increased. In fact, America may be said to be the only country in which they have been reduced. M. de Molinari, the writer of the article in question, estimates the tax paid by the French consumer in wheat alone at about $150,000,000 annually, for the profit of about 800,000 landholders. Calculating in the same way the cost of protection to meat, fish, sugar, tools, etc., he sets down the cost of protection in France at $400,000,000. Nevertheless, one effect of the tariff wars with foreign states in which the Government has engaged, has been the emigration of many French factories to Belgium and the closing of others. Against these increasing burdens, nothing but the extraordinary progress of science and invention during the last twenty years would have enabled the world to make head.

But now, when taxation has apparently reached its uttermost limits, there comes the spectre of socialism to deepen the prevailing gloom. Nobody but ardent socialists, who are a comparatively small body, believes that any large state will ever be organized on a socialistic basis. Any such organization would involve slavery in some form or other, and slavery the mass of men will always resist, sword in hand if necessary. But the agitation for socialism almost necessarily diffuses through the working class a sense of wrong or hatred, more or less intense, of the owners or accumulators of property, and a strong desire to throw on "the state" the care of themselves and their families. The great plan of giving everybody a pension when he reaches the age of sixty is one of the worst blows ever dealt against prudence, frugality, and the habit of saving. The tendency, too, of the labor movements, especially on the continent of Europe, is to lower the value of character for commercial purposes, and to make the retention of places depend more on the strength of the organization a man has behind him than on his personal value to the employer. No reason for supposing that a socialist "state" would be managed by any better men than those who now manage states has ever been given; but the belief has spread largely among the poor and more ignorant class, and is to some extent fostered by preachers, philanthropists, and professional socialists, that if a government with enormously increased powers were set up with men like Powderly, Sovereign, and Debs at the head of it, the happiness of the masses would be largely increased.

To cap the climax, the power of issuing currency has been laid hold of as one potent means of promoting human welfare, and stands now in the forefront of measures of relief for distress, and, though the most patent of human delusions, has been found thus far the hardest to combat, because it has seized upon considerable numbers of persons who pass as economists, but are in reality philanthropists in whose brain "economy" is simply a mode of catching votes. This confused state of the popular mind about the currency has been well illustrated among us by the popular belief, in many parts of the country, that if silver money were set afloat in large quantities, poor people would somehow get some of it into their pockets—an hallucination which has evidently grown out of the "per capita" idea—that is, that every country needs a certain amount of money "per capita." This does no great credit to human intelligence, but it is one of the political forces of the day.

The civilized world is, in fact, apparently threatened with a calamity somewhat similar to that which overthrew the Roman Empire—that is, the seizure of the powers of government by semi-civilized men, or civilized men acting under their direction, and the management of states without the benefit of recorded human experience. From that shock it took a thousand years to recover; that is, there was no recovery until the world rediscovered what the barbarians had buried. No such disaster can overtake us, because there is no danger of the destruction of the great instruments and products of civilization. We have the press and printing, which the mediæval world had not, and we have science, and the habit of discussion, and the practice of government by a majority vote; so that, although our Goths and Vandals may make us for a good while very uncomfortable, they cannot make the world over.

ITALY IN AFRICA.

MANTUA, February 11, 1895.

How Italy drifted into Africa is now a matter of history; that she means to remain there, despite the Mahdi, and with or without the consent of the Abyssinians, is a stubborn fact, proved not only by recent battles here against Dervishes, there against rebel chiefs, but also by her occupation of positions which were not contemplated, or at any rate not avowed, in 1890, when the convention between Menelik

II., King of Shoa, supreme ruler of Abyssinia, and Humbert I., King of Italy, for mutual protection was ratified. Whether King Menelik be a faithful or a faithless ally is an open question; an absolute sovereign he is not, as the twenty-four ras (or feudal lords) who own the territory exercise royal functions, being responsible to the crown for little more than the local taxes which are paid in kind; waging war on one another, offering their services to the governor of the Italian colony, or suddenly attacking his outposts, at their own savage will. Since 1891 a radical change has been effected in Italy's moral and material methods in Eritrea, whose civil and military governor, Oreste Baratieri, a chip of the old Garibaldian block, an enthusiastic believer in colonial expansion in Africa, has inherited not only many of the military qualities of his chief—deliberate premeditation, sudden, swift action, the following up of victory to its just limits, thus far and no further; but also the great Liberator's precepts and practice in dealing with his own officers and soldiers, the enforcement of just and humane action in their dealings with native populations, and especially with native troops; and we may add Garibaldi's practice, in his brief, pithy reports, of giving every officer or special corps their special and due share of merit.

Baratieri, born in 1841, at Condino in the Austrian Tyrol, escaped from the college of Arco at the age of eighteen. Captured and punished, he effected his second flight in time to join Garibaldi in 1860 and land with the Thousand at Marsala, won his spurs at Calatafimi and on the barricades of Palermo, was promoted for his brilliant conduct on the Volturno, and received the medal for military valor. After the disbandment of the volunteers, he entered the crack bersaglieri corps as captain, and at the head of his company kept an Austrian brigade at bay for three hours at Custozza—a feat signalized as "wonderful" in the report of the Austrian staff. As editor of the *Military Review* his articles on military matters were translated into German, and Gen. Moltke paid him high compliments during his attendance at the manœuvres of the German army. Baratieri, like Gen. Bixio, was from the first a fervent believer in Italian colonization in Africa; and shortly after the disastrous affair of Dogali, he obtained "permission" to exchange into one of the corps destined for Massowah, to the great grief of his regiment, where he was adored by officers and men.

Affairs in Africa were in a muddle. After the disaster of Dogali, reinforcements were sent to repel the "King of Kings," who was marching to support Ras Alula, when, turning aside to rout the Dervishes, he was slain, and Crispi, taking advantage of Menelik's friendly offices, negotiated the famous treaty, at the same time inducing the sultans of Obbia on the Somali coast to recognize the protectorate of Italy. By the first treaty with Menelik, recognized as Emperor of Abyssinia, the Italian protectorate ended at Asmara; later they demanded an extension south to the Mareb. To this, Menelik or the ras demurred; also the Emperor protested against the seventeenth article of the treaty, which *bound* him, according to the Italian translation, to treat with no European power save through the Italian Government, whereas he maintained that in the original the text ran that he *might* do so if he chose. This was the first rift within the lute. Then Ras Alula imprisoned and ill-treated the Italian Salimbeni and his companions. Count Pietro Antonelli, sent on a mission by Crispi to Menelik, obtained a very clear insight into the state of affairs. Menelik was anxious to keep on friendly terms with Italy, but the ras who had been devoted to King John, the warrior King of Kings, despised Menelik; many would have supported the claims to the throne of the ambitious Ras Mangasha of recent notoriety, he being the illegitimate son of King John. Meanwhile Gen. Orero had occupied Adua, in Tigre, then withdrew, and in June, 1890, a serio-comic general reconciliation took place. Ras Alula embraced Salimbeni; Ras Mangasha, Ras Alula, and Antonelli also embraced, and swore on the cross and on the Bible an everlasting friendship, and for a time things went more smoothly. The Italian possessions were styled the colony of Eritrea, and Gen. Gandolfi was named civil and military governor.

The best account of the colony in 1890 was given by Sydney Sonnino, now Minister of Finance. Though hopeful of the future, he was impressed by the military disorganization, the want of roads, the wasteful expenditure. The colony was going from bad to worse when, in 1892, the Italian officers being no longer able to keep the native troops in hand, and desertions being frequent, Rudini gave the command to Baratieri, who had his own views as to "African colonization," and would remain at his post only so long as he was allowed to carry them out. From the first moment of his arrival he made it known that what was required in Eritrea was a few picked officers and men as leaders of the native troops, friendly dealings with Menelik and all the ras who proffered friendship, with a sharp watch kept by the Italian residents in all the "protected" territories; absolute distrust of the Dervishes, who, after the occupation of Keren and Agordat, showed themselves more than ever hostile to the Italians. In less than a year a change for the better was everywhere visible; public security was established, stations of carabinieri, with natives under their command, were posted at Asmara and Keren, at Assab, Archico, Moncullo, Dogali, Ghinda, Godofelassi, Nocra, enabling the tribes to cultivate their lands in peace, fearless of raids; new roads were traced and made; the kidnappers of the Beni-Amer tribes were placed under strict surveillance, so that no more girls or children were carried off, and so thorough was the inspection of caravans that the slave-traders found it next to impossible to embark the slaves captured in the Sudan at Massowah, as for years had been their practice. The colony was divided into the district of Massowah, where the administration, judicial, social, and political, is carried on as in Italy, and into dependent territories, where the native laws and uses are respected and applied as far as possible; tribunals of arbitration was set up at Keren and Asmara, judges of peace in the villages, and everywhere resident officials bound to keep the governor "up to date" on all military and local matters. The roads from Ghinda to Asmara, from Asmara to Keren, traced by military engineers, were made chiefly by the natives, and so was it with the digging of artesian wells and the erection of lighthouses. Public hygiene has had close attention: all the water is analyzed, the cisterns cleansed and others constructed; a commission superintends the food sold; the houses are now built of stone to replace the straw huts. Schools where Italian, Arabic, arithmetic, hygiene, and gymnastics are taught have been opened for girls and boys, and bread distributed to encourage attendance. The division of lands was commenced to define what belongs to the tribes, what is ecclesiastical property, how much the state can take possession of and distribute to the natives and to Italian emigrants. Finally, the entire military department was reorganized.

Baratieri from the first maintained that if Italy is to succeed in Africa, it must be with native troops under Italian officers, with few or no Italian soldiers save for the engineering and artillery departments. Hence he divided the native troops into permanent and auxiliary, with departments in Barca, Saraè, Oculè-Kusai, and in the territory round Asmara, with telegraph lines insuring communication between them. Hitherto the governors and commanders-in-chief have resided exclusively in Massowah. Baratieri decided to pass half the year on the high table-land of Asmara, and personally inspected at unexpected moments camps, forts, hospitals, police stations, etc. "Keep your men well in hand and get hold of their hearts," is his constant advice to the Italian officers. With the ras he has tried to keep on friendly terms, but, while putting faith in them to a certain extent, has kept his own powder dry. As to the Dervishes, he has always expected them to attack at any moment. In November, 1893, they took advantage of his absence in Italy, whither he had gone to confer with the Government on military and civil matters, to make a desperate assault on Agordat. I must pass over the details of the successful defence of that place by Col. Arimondi, left in command by Baratieri. On the Governor's return he at once laid his plans for future operations, concentrating ammunition and provisions in Agordat. On the 12th of July, 1894, he assumed the command of the corps destined to march on Kassala—56 officers, 41 Italian soldiers, 2,510 ascars (native Abyssinian troops), 146 horses, 248 mules, 183 camels. Everywhere they found traces of the recent raids of the Dervishes, villages destroyed and abandoned. The enemy were encamped to the north and northeast of the city. At six A. M. on the morning of the 17th of July the van opened fire on their cavalry, just setting out for a raid; then the Italian cavalry charged, and the attack became general, lasting uninterruptedly for three hours. At ten A. M. Baratieri and Arimondi were in the marketplace victors, and a halt was ordered, as the troops had marched all night before the combat.

The Governor's first care was to liberate some 100 Egyptian prisoners, and to enforce respect on the part of his troops for the members of the various tribes gathered there to cultivate the fertile shores of the Gasc, to whom he distributed quantities of the dura found in the depots of the Mahdi. Numbers of them asked to be allowed to go to the Eritrea colony; others, finding that the Italians meant to hold Kassala and build a fort there, preferred to remain. The Mahdi fled across the Atbara, leaving 52 banners, 2 guns, 600 muskets, 700 lances, 200 camels, mules, and horses. On the 23d the Governor quitted Kassala, leaving Major Turitto, with some hundred natives and their officers and engineers, to complete the fort which King Humbert himself named "Fort Baratieri." The absolute silence maintained, the rapid march and instantaneous victory, astonished the colony and Italy; the ras of Abyssinia were profuse in their congratulations and offers of native bands to guard the frontiers against fresh attacks of the Mahdi. Baratieri accepted their offers, but evidently distrusted their intentions, bidding his residents keep a sharp lookout on their movements.

The rest of the year passed quietly. The Pope consented to send to Eritrea an Apostolic Nun-

cio, who received a grand welcome, gladdening the hearts of the Italians by his encomiums on "our" brave King Humbert, "our" gracious Queen Margaret. The exchange of the Italian sisters of charity and Italian Capuchins for the French Lazzarists added to their satisfaction. In November Baratieri appealed to the European residents to form a body of volunteers, and in one day 320 citizens of Massowah responded to the appeal. He had asked for no reinforcements, but had strengthened the garrisons of Asmara, Keren, and Kassala, when suddenly came the news of the rebellion of Batha Agos, one of the Abyssinian commanders, who, from the earliest days of the colony, had given proofs of friendship for the Italians, and had been promoted by Baldassera and later by Baratieri. Seizing the "residents" and the telegraph officers, he was preparing to raise the whole province when Capt. Castellazzi and other officers marched against him, killed or captured the 300 armed followers, killing Batha Agos himself at Halai. Baratieri, rightly suspecting that the rebellion of the bands of Oculè-Kusai, commanded by Batha Agos, was not an isolated case, but was probably fomented by Ras Mangasha, and possibly by Menelik, marched promptly to Adi Ugra, where he established Arimondi, now major-general, in command. Later, convinced of Ras Mangasha's treasonable intent, by forced marches he proceeded to Adi Sadi, where from a height he saw an immense mass of Tigrine troops marching northwards. At dawn the enemy's two camps were visible. The artillery, well posted, opened the ball; the troops converging to the right attacked the whole front of the enemy, who, though taken by surprise, responded en masse and soon made a move to turn Baratieri's left wing, but were outmanœuvred. The battle raged for twelve mortal hours, the enemy bringing up a strong reserve force at three P. M., but at five they were silent, and during the night they decamped, leaving their wounded, arms, banners, and some tents on the field. Baratieri followed in hot pursuit till the enemy reached the fastnesses of Agamè. The Italians, 3,600 all told, thus routed 10,000, led by Ras Mangasha in person. Not a single soldier deserted, so that Menelik's boast that the "Abyssinians, brave against the Dervishes, would never fight against their brethren in blood and faith," falls to the ground. On the 18th, leaving two companies in observation at Senafè, Baratieri returned with the rest of the troops to Asmara, everywhere fêted by the populations and the clergy who are weary to death of the turbulent ras. Ras Mangasha's correspondence with Batha Agos and Menelik has been seized, but Baratieri's final report has not yet arrived.

At present all is quiet at Kassala. Ras Mangasha, deserted by the mass of his troops, seems still seeking to form a fresh army. What Menelik and Ras Alula, who is with the King, think or meditate is not known. Baratieri does not desire reinforcements, save a few officers, material, and telegraph wires. He has just been promoted from the rank of major-general to that of lieutenant-general. His telegrams and brief reports demonstrate his pride and satisfaction at the conduct of the native troops and Italian officers all. But Italy in Africa has her hands full to hold her own against Dervishes and rebel ras. J. W. M.

SOME CONTINENTAL LIBRARIES.—V.

FLORENCE, February 18, 1895.

ITALIAN Government libraries exist in the following places: Bologna, Cagliari, Catania, Cremona, Florence, Genoa, Lucca, Milan, Modena, Messina, Naples, Padua, Palermo, Pavia, Pisa, Parma, Rome, Sassari, Turin, and Venice. Of these Florence has four, a larger number than any other city except Rome; and the principal one, the Biblioteca Centrale Nazionale, may be called the dean of the entire faculty. It is the largest collection of books in Italy. Its foundation as a public library was laid in the eighteenth century by Antonio Magliabechi. In his will this lover of books and men left his large collection "to the poor of the city of Florence." From that time to the present the library has been the recipient of many gifts and bequests, which, with its purchases, have made it a collection of over 435,000 volumes and more than 450,000 pamphlets, 18,000 MSS., and 11,000 musical compositions, according to the last printed report of 1893 and a statement made by the prefect, Signor Chilovi, in November, 1894. It occupies eighty-seven rooms—three floors of three palaces—and, even with this, is embarrassed for space. A new building is anticipated in the not distant future.

The first attempt to furnish the library with books by means of a tax on the issues of printing-offices was made in 1736 by the Grand Duke of Tuscany, Gian Gastone, who directed that a free copy of everything published in Tuscany should be deposited in this library. There were many difficulties in the way of carrying out this law, owing chiefly to the objections and evasions of the printers, and it was virtually inoperative for many years. In June, 1870, Victor Emanuel extended the law to cover the publications of the entire kingdom, resulting in an average addition to the library of ten to twenty thousand volumes and pamphlets per year. Evasions of the law are still not infrequent, especially in the case of costly publications. In the eighteenth century, a hundred years before the confiscation of the monastic libraries under Victor Emanuel, the Grand Duke Pietro Leopoldo had suppressed certain religious houses and given their books to the Magliabechiana, and the French Government when in power did the same thing. In 1861 the Palatina and the Magliabechiana were combined and took the present name of the Biblioteca Nazionale. One of the most interesting acquisitions of recent years was that of the collection of Savonaroliana got together by Count Carlo Capponi, and sold by his heirs in 1883.

The main entrance to the Library is from the portico of the Uffizi. The reading-room, on the first floor, has been full every time I have visited it, and the one table out of the nine reserved for the use of women has been well patronized. The majority of the readers seem to be students from the University and Higher Institute, with a sprinkling of professors, priests, professional men, etc. This room contains the larger part of the original Magliabechian bequest, and a bust of the very ugly but strongly individual face and head of Magliabechi surveys the room. Among the current periodicals (about one hundred and fifty) placed here for reading, I counted some fifteen to twenty American magazines, among which were several such popular ones as *Harper's Monthly*, the *Century*, the *Popular Science Monthly*, and the *Literary News*. An adjoining room, called the MS. room, is for the use of those students who need extreme quiet in the pursuance of more absorbing work.

The catalogue used by the public is a general one, compiled in 1847 and transcribed in 1860–'64, in thirty-two large volumes. The large influx of additions after the promulgation and enforcement of the tax on all Italian publications found the library somewhat unprepared for the additional work thus made necessary, and lacking sufficient space in its catalogues; and a supplementary catalogue on cards became necessary. The Palatina, and the Targioni, the Nencini, Passerini, and Guicciardini collections have each a separate catalogue, and there is one of incunabula and an index to the collection of ancient music. A general catalogue of the entire library, arranged in twenty classes, was undertaken in 1864, but given up for reasons of necessity, and another begun about ten years ago, which is still in the making. In the matter of classification, no one system has yet been applied to the whole library; some collections are arranged by size, some by subject-matter, some by literary form. The bound periodicals are grouped by the decimal classification of Mr. Melvil Dewey, the New York State Librarian. The inventory is kept on cards, with the exception of that of pamphlets, which is in volumes, and is placed in a locked case to which only a few of the employees have access. The catalogues are open to any one who wishes to consult them, though lack of space prevents their use by many persons at one time. The same lack of room prevents the exposition of all reference-books and periodicals, and a careful selection is therefore made of those which experience shows to be most in demand.

The library lends books under the usual conditions of Government libraries, and the former prefect of the Nazionale, Signor Sacconi, was in favor of extending this privilege, leaving it optional with the librarian in each case to say how many books should go out to one reader, and how long they might be kept. In seven years he reports but one book lost by lending, and that by accident and not through any evil intention on the part of the borrower.

An interesting comment is made by the same good authority on the system of competitive examinations for the filling of library positions. In the case of the superior employees, scholarship, while necessary, is not all that is necessary, and he claims that in making it the sole test, as is the case in competitive examinations, no regard is paid to moral character or to executive qualities. The librarian or prefect is obliged to accept as subordinates persons whose qualifications fit them for only a part of their work, and who need constant supervision. He arrives at the conclusion that these officers should be of two classes, those chosen for their scholarship and knowledge of books, who may eventually be fitted to take the highest work of the library, the choosing and buying of the books, and those who show administrative ability, and who must be retained in the offices requiring executive skill, but who cannot expect promotion into the upper grade just mentioned. The same difficulty exists in choosing the prefect and the librarian, and Signor Sacconi makes the suggestion that, where several Government libraries exist in the same city, each be placed under the charge of a librarian or executive officer, and altogether under one prefect, who shall be a scholar of reputation and shall attend to the symmetrical growth of all the collections under his charge. This suggestion was made in 1883, in a MS. "relation" on the Biblioteca Nazionale, to which I had access through the kindness of Signora Sacconi-Ricci, daughter of the former prefect of the Nazionale, and herself assistant-librarian of the Marucelliana. So far as I know, no steps have been taken towards adopting it, but to me it seems a very reasonable proposition.

The alumni, who had formerly to serve at least a year gratuitously, are now allowed a nominal payment. They must have a doctorate in law, literature, or philosophy, or the diploma of the school of paleography in Florence, and must pass a competitive examination. From thirty-four years of experience, Signor Sacconi records it as his belief that the test of competitive examinations alone is quite as apt to give poor assistants as good ones. The nature of the examinations for the superior positions of a library I have already indicated in a previous letter. The usual method of procedure after an examination is the appointment, by the minister of public instruction, of the most successful candidates to a year's trial, with a stipend of one hundred lire a month. If the year's work prove satisfactory, the alumni are placed on the roll in the lowest class of the category to which they belong. The necessity of inquiry into the moral character of the applicant was made most evident in 1870 and 1871, in the Nazionale, by a series of thefts carried on through several months by one of the distributors. A second-hand book-dealer in Florence sent regularly to the library to indicate to this employee the books he desired, and the employee found means of abstracting them.

The heating of the Nazionale is accomplished at present by furnaces, and the rooms used by the public have always seemed to me warm and comfortable. Up to 1867 the ubiquitous scaldino or brazier was the only means of heating, and was abandoned because it was found that the ashes were annoying to readers and injurious to the books. There is apparently no dampness anywhere in the library. The hours of opening of the library, summer and winter, are from ten to four. The number of volumes given out in 1892, from the last printed report of 1893, was more than 66,000, to more than 56,000 readers. These are not as large numbers as those reported by the Vittorio Emanuele at Rome, but it must be remembered that the latter library is open in the evening, and that it supplies a much larger population. Nearly 3,000 volumes were lent in Florence, and more than 1,000 to other libraries in Italy, while more than 100 were borrowed from other cities. The right to a copy of all Italian publications includes periodicals and newspapers, and the Nazionale has therefore a collection, constantly increasing, of 900 newspapers and 1,200 magazines. It collects and preserves everything, down to railway time-tables and play-bills. At present, order is being brought out of the chaos of 60,000 legal memorials presented in the Italian courts. To this library, since 1886, has been given the task of printing fortnightly a Bulletin of the most important Italian publications, and this admirably conducted work is known and appreciated wherever there are libraries. The Bulletin formerly issued by the Vittorio Emanuele of Rome, of modern foreign works in Italian libraries, has unfortunately ceased publication. In this the library containing the work was always indicated by a mark opposite its title.

The rarities of the library are numerous, and space forbids the mention of more than a few, and these chosen rather at haphazard: A MS. of the 'Divina Commedia,' of the fourteenth century, with the marginal notes made in Dante's lifetime; a letter written by the poet's son, Dante d'Jacopo Alighieri; a MS. of the 'Decameron' written in 1396 by a Benedictine; Brunetto Latini in a MS. of 1285; and, of incunabula, a copy of the third book printed by Fust & Schœffer in 1459; the celebrated Maguntina Bible; a Terence with marginal MS. notes by Politian—in fact, several works with notes from the same source; the first book printed in Florence, by Cennini, who rediscovered the secret of printing after a careful examination of the issues of the German press; the first illustrated book printed in Italy; the Florentine Homer of 1488, presented by the editor to Piero de' Medici, etc. Of editions of Dante there are Ridobeatina's, a copy that belonged to Ariosto and that bears his signature and notes, one with Landino's commentary and illustrations by Botticelli, the same on parchment, a unique copy, presented by Landino to the Signory of Florence, etc., etc. Of Aldines, the library has 1,087 volumes, and of Elzevirs, etc., 352 volumes, and the Savonaroliana numbers 347 editions.

The funds at the disposition of the administration amount to about 52,000 lire ($10,400) a year. The admission of women into library-work has been conceded in no Continental country except Italy, I believe. One woman is employed in the Vittorio Emanuele, three in the Biblioteca Nazionale, and one as assistant-librarian in the Marucelliana. Most of these ladies I have met, and found deeply interested in their work, as well as in the comparisons we were able to make between libraries here and at home. I should fail greatly in what is a pleasure as well as an obligation if I did not speak more fully of one of these, Signora Giulia Sacconi-Ricci. From the moment of my entrance into the Marucellian Library and my kind reception at the hands of the librarian, the Cavalier Bruschi, and Signora Ricci, I felt myself in an atmosphere of "mental hospitality" both to people and ideas. There is not, in the six or seven rooms of the library, such an overplus of books but that everything is kept in the best of order, and the silence in the reading-room, which was generally well filled even in the worst weather, was less disturbed by conversation than in any library I had yet visited. In the room reserved for women and presided over by the assistant-librarian, there were always a number of university girls or teachers, industriously turning the leaves of books of reference or consulting MSS., etc.; and the occasional tributes of flowers brought by them to Signora Ricci testified to her popularity and gave a feminine and home-like air to the room. The reference-books and bibliographical collection are kept in this room, and men occasionally study here if they prefer, but for the most part they "go to their own place."

The Marucellian collection is rather more modern in character than most of the libraries here, confining its purchases chiefly to modern books of importance. Its hours are from nine to three in winter, nine to five in summer, and from six to nine on winter evenings. In these evening hours it is apt to be crowded, as many as two hundred persons frequently requiring to be waited upon in one evening. It is the only library open in the evening, I am told. The collection amounts to about 120,000 volumes and pamphlets, including very few rarities, but a great many expensive art-works, and a collection of one hundred volumes of rare engravings illustrating the history of the art with great completeness. This collection was made by Francesco Marucelli, founder of the library. In addition to its own catalogues, the library possesses a card-catalogue by subjects of the Biblioteca Nazionale, formerly owned by Signor Sacconi and by him presented to the Marucelliana. Of its own collection there are a bound MS. catalogue by subjects, kept in the reading-room, an alphabetical catalogue in twenty-two volumes which is free for public consultation, and one of incunabula on loose sheets, fastened by an invention of Signora Sacconi-Ricci's, the catalogue itself having been beautifully made by her on the Hammond typewriter. The most interesting bit of antiquity in the library is the MS. of the 'Mare Magnum,' compiled by Francesco Marucelli. It occupies one hundred vellum-bound volumes, and was put into print a few years ago by the labors of Professor Guido Biagi.

More interest in the progress of librarianship and a better acquaintance with the technical literature of the profession in other countries were evidenced here, it seemed to me, than in any other library I had visited. The cataloguing rules of Prof. Karl Dziatzko, for example, had been translated from the German into Italian by the librarian and published in Florence, and the assistant-librarian's devotion had even impelled her to visit libraries and take notes on them, in the course of her wedding-journey a few years ago, the results of her investigations appearing in book-form after her return.

There still remain to be spoken of the Riccardiana, the wonderful Laurenziana, and the great subscription library of the city, Vieusseux's; but these must wait for time and space to do them justice. MARY W. PLUMMER.

Correspondence.

ELEMENTARY INSTRUCTION.

TO THE EDITOR OF THE NATION:

SIR: In your editorial on Elementary Instruction in the *Nation* for February 21, in speaking of the Report of the Committee of Fifteen, you mention the report of my subcommittee on correlation of studies as disappointing, for a number of reasons which are very clearly, but not, I think, quite fairly stated. For instance, you say, "Six years is ample time for the strictly elementary course, and to insist upon eight years is simply to yield to the influence of a bad but prevailing custom." This sentence comes after the statement that assent to all of my propositions is impossible, and implies that my report insists on eight years for the elementary course when six years will do. Now, as a matter of fact I have taken (as I think) great pains in the report to show that the eight-year period is too long for the work required to master the strictly elementary studies. It leads, as I point out, to a sort of mechanical thoroughness which arrests the development or growth of the pupil on a mechanical plane. I therefore suggest that two of the chief branches of the secondary school, namely, algebra and Latin or some modern language, be introduced into the last two years of the elementary school, substituting Latin for English grammar in the eighth year and algebra for arithmetic in the seventh and eighth years. In view of this recommendation and the arguments on which it is based, I am puzzled at your statement, further on, that "arguments are adduced [in the report] for postponing the use of the simpler algebraic processes."

Besides this very important matter of curtailing the time for mere elementary studies, the report recommends the substitution of a new basis for the selection of school studies. The old one was psychological and formal. According to it, gymnastics or chess-playing would stand as good a chance for selection as manual training, grammar, or arithmetic. On

the sociological basis, those studies would be adopted which prepare the child to receive the lessons of civilization and partake of its goods, contributing his own mite for the benefit of the whole, helping and being helped. The psychological basis is retained, but only in a secondary place, to assist in deciding such questions as relate to the best period for taking up a given branch of study, and the proper length of time for continuing it. A study is often continued too long in the elementary schools, and is necessarily deadening in its effects, and produces arrested development on some lower plane of activity. This danger is becoming plainer and plainer in the light of the new studies made upon children in school and out of school.

Another important departure in the sub-committee's report under question is the protest against too much English grammar, especially in the form of parsing works of literary art. Again and again in the report it is urged that the literary selection should be studied in such a way as to lead to an appreciation of it as a work of art. Literature is set forward as the leading study in the elementary school because of its value to the pupil in giving him an insight into human nature.

Again, the emphasis laid upon arithmetic in the elementary school hitherto is strongly condemned, and its mode of reasoning disparaged in comparison with the mode of reasoning employed by the mind upon practical concrete subjects involving literary, social, and moral questions.

Several other radical changes are recommended in this sub-committee's report, and on the whole it seems to me that the report will be extremely fortunate if it does not disappoint your readers rather in its radicalism than its conservatism.

Very respectfully, W. T. Harris.

Washington, D. C., February 26, 1895.

[It is true that Dr. Harris advocates the introduction of two secondary-school subjects into the later years of the elementary curriculum, but he keeps that curriculum eight years long. That is made necessary only either by bad teaching or by spinning out the instruction in the rudiments to an inordinate extent. On page 40 of his report he reduces the algebra to be taught in the elementary schools to a pretty small amount—so much so that Mr. Greenwood makes this a special point of dissent (pp. 84, 85). What Dr. Harris says as to English grammar and the undue emphasis hitherto laid on arithmetic, is entitled to all praise.—Ed. Nation.]

BARON DE MÉNEVAL.

To the Editor of The Nation:

Sir: The notice of Baron de Méneval's Memoirs published by the *Nation* in its number of February 21 conveys such an unjust estimate of the author of those memoirs that I deem it my duty to answer it. I have not a word to say in favor of or against the merits of the work. I only wish to call attention to certain misstatements made by the writer of the article concerning facts he evidently knew nothing about.

Speaking of M. de Méneval, he tells us that "the blood of a race of courtiers filled his veins." Later he speaks of "his grandfather in the halls of Versailles." The truth is, that M. de Méneval's family had always lived in the seclusion of the provinces, and none of his ancestors ever appeared at court. He himself was so little of a courtier that he never entered the Tuileries after 1815, and refused the peerage that was offered to him by Louis Philippe. Instead of a "light-hearted" gentleman, he was a man of retiring disposition, deep feelings, and austere character. Far from being a sycophant, he was the personification of dignity and modesty.

Further, it is said: "Méneval did live on with pen in hand." The only book he wrote is the one now mentioned; and he lived seventy-two years. Those memoirs, or rather souvenirs, were published by him in 1840 under the title 'Napoléon et Marie Louise: Souvenirs du Baron de Méneval.' They formed only two small volumes. At that time the only books or pamphlets written about Napoleon had been inspired by fear of the Bourbons and the basest ingratitude. The desire of defending the memory of the man who had been his friend and protector was not an ignoble one. At an epoch when those who had received titles, endowments, palaces, and money from the Emperor not only turned against him during his lifetime, but, after his death, assailed him with insults and often calumny, was it "canine virtue" or noble courage to defend him?

Admitting, even, that his admiration for Napoleon carried him too far, who is the most worthy of respect, Monsieur de Méneval or Madame de Rémusat?

A Grandson of Baron de Méneval.

February 26, 1895.

MEMOIRS OF LAREVELLIÈRE-LÉPEAUX.

To the Editor of The Nation:

Sir: In the interesting description of these Memoirs which appeared in the *Nation* of February 21 is the statement that the Director "ordered that his manuscripts should not become accessible to anybody before 1873." This is a strange misunderstanding of what the Director's son, who edited his manuscripts, says about the matter in the introduction, dated March 15, 1873. Feeling that the lapse of fifty years since his father wrote the last line of the Memoirs required an explanation, he gives a detailed account of the various delays. His father had suggested in the "Observations Essentielles" which serve as a sort of preamble, that "Comme je veux qu'aucun nom, aucun fait ne soit déguisé dans mes mémoires, ils ne devront être publiés qu'à l'époque où il sera présumable que tous ceux qui y figurent n'existent plus."

Larevellière, furthermore, did not wish his words to serve as an arsenal for an assault upon men who, however they might have differed from him during the Revolution, were now defenders of liberty against the attacks of the Bourbons. But he did wish the Memoirs edited at once, so that the first favorable moment might be seized for their publication. Soon came the Revolution of 1830, bringing an Orleanist prince to the throne. As the Memoirs contained damaging facts in regard to the older Orleanist party, the son, who believed in the Monarchy of July, did not desire the manuscript published until the new dynasty was so solidly established that it would not suffer from such revelations. The Revolution of 1848 came and went, and during the early period of the Second Empire it was impossible to undertake "une publication aussi peu conforme que celle ci au culte des idées napoléoniennes." In 1870 the work was far advanced when the disasters of that fatal summer and the siege of Paris still further put off its completion. Postponement had at last become chronic. Although the Memoirs seem to have been printed not long after 1873, as stated in the *Nation* of February 14, the son requested that they be not published until his wife's death, which occurred only four years ago. But as President Carnot's term of office was then drawing to a close, and party bitterness was likely to make an unhappy use of whatever Larevellière had said of Carnot's grandfather, a colleague in the Directory, it seemed wise to reserve the publication until the present year.

A word in regard to the Director's name. It is a pity that his son chose the current form instead of the form which the Director himself used during the most important part of his political life, *i. e.*, L. M. Revellière-Lépeaux. His baptismal name was Louis-Marie de La Revellière. Lépeaux came from one of the family estates. Henry E. Bourne.

Western Reserve University.

AN INDEX ALWAYS.

To the Editor of The Nation:

Sir: At the close of your notice, February 28, p. 172, of Mr. Chadwick's excellent book, you say: "An index is perhaps not to be expected in a collection of what were originally lectures," etc. In the name of all that is decent in book-making, why should you, after your long and valiant service in the cause of good indexes in books, now condone an offence like the omission of an index from any book, except, perhaps, a dictionary? Such a book as Mr. Chadwick's needs an index as much as any; nor is it apparent why one should not be expected in a book "of what were originally lectures" as well as in any other. I have a note of two other books lately published which commit the unpardonable offence of appearing before the public indexless: the 'Life and Letters of Charles Loring Brace' and Hamilton W. Mabie's 'My Study Fire' (both series).

One may surely be pardoned, in making any allusion to your issue of this week, for expressing the intense satisfaction with which all lovers of good literature must read your editorial on "The New Criticism." It is "a most palpable hit" at a grievous literary evil, and must do good.—Very truly yours, W. I. F.

Amherst, March 1, 1895.

[We little thought our good would be evil spoken of. Our correspondent excepts dictionaries, and thereby lays himself open to our rebuke as surely as we to his. Beginning with its fifteenth volume, the 'Dictionary of National Biography' has been regularly indexed, to great advantage; and no cyclopædia is now completely serviceable without an index. —Ed. Nation.]

BAD DEBTS AND THE INCOME TAX.

To the Editor of The Nation:

Sir: I desire to call attention to a manifest error in the income-tax law, or rather in the interpretation of it by the Commissioner of Internal Revenue. On page 31 of the pamphlet sent out by that office, at section 12, it is

stated that no bad debts can be deducted as losses unless the same were contracted *within the year* for which the return is made.

To illustrate the unfairness and absurdity of this proposition, let us take the case of a merchant, A, who in December, 1894, sells goods to B for $1,000. This sale is included in A's business for 1894. B is solvent when the sale is made and for a month afterwards. In January, 1895, B fails and becomes insolvent, and the $1,000 becomes absolutely uncollectible, according to the requirements of the law. Under the ruling of the Commissioner, A, in returning his income for 1894, could not deduct this $1,000 as a loss, because the debt was not contracted in that year, nor could such loss ever be deducted.

The Commissioner virtually lays down the rule that no lost debt can be deducted unless the claim was *contracted and lost in the same year*. This is on its face an absurdity. The law contains no such provision, and neither this law nor any other statute will bear any such construction. The first requisite of legal construction is conformity to common sense and the evident meaning of the statute, neither of which will sustain such an interpretation as the foregoing. The evident intention of the law is to permit merchants and others to charge off in any one year only the actually worthless debts which have become so since the previous year's settlement, and to prevent any one crediting himself with losses which do not legitimately belong to the year's business. This is the rule which all honest men follow in ascertaining the annual returns of their business, and is the only method by which the annual profit or income can be stated. It is evident that so hastily constructed a statute as the present income-tax law should receive more careful judicial construction than can be given it by the clerical force of the Revenue Department.

LEX.

CHICAGO, February 25, 1895.

Notes.

G. P. PUTNAM'S SONS will shortly issue 'The Armenian Crisis—The Massacre of 1894: Its Antecedents and Significance,' by Frederick Davis Greene, with illustrations.

Forthcoming publications of Messrs. Scribner are 'Lotos-Time in Japan,' by Henry T. Finck; 'The Peoples and Politics of the Far East,' by Henry Norman; 'Churches and Castles of Mediæval France,' by Walter C. Larned; 'Letters of a Baritone,' from Florence, by Francis Walker; 'Essays on Scandinavian Literature,' by Prof. H. H. Boyesen; and 'The Making of the Nation,' by Gen. Francis A. Walker.

'The Story of Christine Rochefort,' about to be published by Houghton, Mifflin & Co., is by a granddaughter of Rufus Choate, Mrs. Helen Choate Prince.

'Wolfe,' by A. G. Bradley; 'Colin Campbell,' by Archibald Forbes; and 'Nelson,' by J. K. Laughton, will be the next additions to Macmillan's "Men of Action" series.

T. Y. Crowell & Co. announce 'Forests and Forestry,' by B. E. Fernow, chief of the division of forestry in the Department of Agriculture; and 'Marriage, the Family, and Divorce,' by Prof. Geo. E. Howard of the Leland Stanford University.

'Chambers's Concise Gazetteer' (Lippincott) has a clear field of usefulness and is decidedly to be recommended. It has been well if anonymously edited, and is in the longer articles by no means dry reading. It is selective, of course, but will answer ordinary demands in a satisfactory manner. 'Chambers's Encyclopædia' has served as a basis of compilation. Its notices of the Louisville tornado of 1890, the Seattle and Spokane fires and Johnstown flood of 1889, and the Charleston earthquake of 1886 show it to be well up to date. Often the population of places is given from two censuses, as 1880 and 1890. Accent is usually indicated, and pronunciation often in the more difficult cases, as Hawarden (pron. Harden). Not infrequently books of reference are named. The usage of this gazetteer in the case of capes is to enter under the name proper, as Horn (Cape); or a cross-reference sends us from Good Hope (Cape) to Cape of Good Hope. Only two lakes are entered under Lake, and no mountain under Mountain (except Mont Blanc, Mont Cenis). As far as possible the latter are grouped under ranges, Alps, Appalachian, White Mountains, Cascade Range (in the case of Mt. Rainier, for example); sometimes we are referred to the country, as to Russia for the Ural Mountains. The Saint names are grouped together under S. The United States is well looked after. We miss Mt. Desert.

The 'Laboratory Manual of Physics and Applied Electricity,' arranged and edited by Prof. Edward L. Nichols of Cornell University, which has recently been published by Macmillan, is admirably adapted to supply the needs of the modern physical laboratory. The first of the two volumes is intended for beginners, and gives explicit directions for the experimental work, together with some demonstrations and statements of principles. The second volume is occupied with schemes and suggestions of work for seniors and advanced students; especial attention being given to the needs of those who are preparing to become electrical engineers. The two volumes are of equal length, and together contain something over 800 pages, but do not, as the editor states, "attempt to provide a complete and sufficient source of information for laboratory students," who are encouraged to make continual reference to other works and to original sources.

Students of physical chemistry who are unfamiliar with German will welcome the translation of Ostwald's 'Physico-Chemical Measurements,' by James Walker (Macmillan). The book is written not for the beginner, but for the chemist or physicist who desires to become practically acquainted with the borderland common to both sciences. Both purpose and contents distinguish this book from the existing handbooks for the physical laboratory, and it introduces the student to a region of experimental work which has already proved of great fruitfulness to chemistry. No one is better qualified than Prof. Ostwald for the preparation of such a work. As one of the leaders in the modern field of physical chemistry, he has not only the largest practical experience in the laboratory processes which are described, but also the gift of exact and clear presentation. He has been fortunate in his translator, who has given us an excellent piece of work, in pleasing contrast to much that is inflicted on a long-suffering public.

The most important publication of the past year relating to physical chemistry is that of a second edition of Landolt and Börnstein's 'Physicalisch-Chemische Tabellen.' The accumulation of data has been so rapid since the appearance of the 'Tabellen' ten years ago, that this new edition contains more than twice as many pages (563) as its predecessor. It is all that one can ask for in a reference-book—full and exact; compiled as far as possible from original sources and the sources cited; conveniently arranged; clearly and generously printed; and well bound in covers of moleskin.

To limit the 'Text-Book of Anatomy and Physiology for Nurses,' modestly described as "compiled" by Diana Clifford Kimber (Macmillan), to the class designated in its title, is to depreciate and to neglect other deserving students. This well-arranged and admirable account of the machinery and methods of life deserves a place in every high-grade school for young women. The author, for she is such as truly as any one outside of the little group of original investigators, has the true teaching faculty, and has produced a volume that merits the admirable illustrations and the excellent make-up which the publishers have given it.

It is always tantalizing to read pathology, because the pathologist stops with his statement of damages, and only by inference, and then obscurely, shows a mode of avoidance or of repair. This is emphasized just now by the appearance of the second and concluding volume of the monumental 'Text-Book of Pathology,' by the Aberdeen professor, D. J. Hamilton, in two parts, of more than eleven hundred pages, copiously illustrated (Macmillan). The work touches every conceivable point in the long catalogue of human ills, and includes such cognate matters as systematic bacteriology and animal parasites. Where conditions or hypotheses are still undetermined, it frankly says so; where they are determined, its statements, as far as we have been able to examine, may be depended upon. We commend but cannot review this mass of erudition. It is very thoroughly indexed, and has a voluminous bibliography.

One who observes the antics of the great herd of half-groomed men who roam over the ranges of the liberal professions must sometimes think that "liberal" means free, and that, like the high seas or the plains, these ranges are open to all comers. Its best friends often mourn in this way over medicine, whether looking at the *ad-captandum* methods of the practitioner on money bent, or at the "popular" Treatments or Methods with which the market is flooded, and sometimes at the verbose and obscure Systems and Treatises that lack system and require elucidation. A monograph that is dignified but not pedantic, attentive to particulars but not to trivialities, clear in style and replete with observation controlled by study, is therefore very welcome. Such is 'The Senile Heart,' by George William Balfour, M.D. (St. And.), LL.D. (Ed.), whose right to those honors these pages show upon their face. It is a book for physicians, but the introductory chapter at least would be attractive to any intelligent reader, and connected passages all through it carry the same untechnical charm. Macmillan & Co. publish it.

M. Edmond Biré has actually given us a bulky volume of literary essays, 'Études et Portraits' (Lyon: Vitte), which is not wholly or even mostly devoted to pitching into Victor Hugo, and somehow the book is all the better for this amazing omission. There are excellent articles on Chateaubriand, in which M. Biré establishes the fact that the 'Mémoires d'Outre-Tombe' did not appear, even in part, before Chateaubriand's death, on Lamartine, on Balzac's unsuccessful efforts to enter the French Academy, on Marmier and the Lomé-nies, besides other writers less well known or less generally interesting.

M. Max Leclerc gives proof of prodigious

courage in publishing his second volume on education and society in England, 'Les Professions et la Société en Angleterre' (Paris: Colin & Cie.). In so chauvinistic a country as France, to uphold the superiority of England in the practical education of its people, in its management of public affairs, in its commonsense view of daily life, is to run the risk of being called a good many hard names. But M. Leclerc sees that superiority, and believes it wisest for his countrymen to realize it, to study the reasons of it, and then to go to work to acquire it for France instead of merely raging at perfidious Albion and proclaiming themselves, maugre everything, the first and most enlightened nation in the world. Two things are encouraging: that there are Frenchmen bold enough to tell the truth to their countrymen, and that their countrymen listen and profit. For M. Leclerc's book is not the only one in which, of late, very serious lessons have been very plainly taught the too long self-satisfied Gallic race.

Anselme Mathieu, a Provençal poet, and one of the seven founders of the Félibrige, died recently at Avignon. He was known, in the florid terminology of his school, as the Poet of Kisses. Early in February he fell on the ice and broke a leg, and, being seventy years old, did not rally from the shock. Sumptuous obsequies were celebrated for him, and his old friend Frédéric Mistral was a chief mourner. Of the seven founders of the Félibrige two only are now left: Mistral and Alphonse Tavau. Five are dead: Aubanel, Roumanille, Roumieux, Brunet, and Mathieu.

Public Opinion, heretofore conducted in Washington, will transfer its publication office this week to New York, with, we should suppose, a gain rather than a loss in efficiency and freshness of compilation from the press utterances of the day.

The well-known English trade journal *Timber* has in its issue of January 23 matter of particular interest for the United States and Canada, being the illustrated report of a special correspondent concerning our lumber industry. There are also several views of the Manchester ship-canal, with its "timber pond." A folded map of the canal accompanies the letterpress.

From Westermann & Co. we receive in a neat portfolio a four-plate wall-map of the world's commerce, on a scale of 1:22,000,000 (equatorial). Four side-maps exhibit Central America (West Indies) on twice the above scale, and the North Sea and its canal, the Isthmus of Suez, and the Straits of Malacca at half scale. The compiler, A. Herrich, delineates the various regular steamship routes, with length in days, the chief railroads, the cables and land telegraphs, the navigable parts of rivers, etc. Mr. Boutelle would undoubtedly cavil at this map because of the meagre showing made in it by the commerce of Hawaii in comparison with Atlantic trade; but facts are stubborn things.

A geological map of Essex County, Mass., prepared by John H. Sears, curator of geology in the Peabody Academy of Science at Salem, has been published by the Essex Institute of that city. It presents the results of long-continued and patient field work by its author over a district of great complexity of structure. There are seventeen varieties of rocks, distinguished by different colors, and twelve other subdivisions, indicated by overprinted numbers; the formations exhibited being chiefly crystalline and metamorphic rocks of most irregular arrangement. The various forms of glacial drift, by which so large an area of the county is covered, are not indicated, although drumlins, inland marshes, and coastal sand-bars are extensively developed. These might be to advantage added to a later edition of the map. The present issue is dedicated to the Lawrence Scientific School of Harvard University, where Mr. Sears carried on his petrographical studies under the direction of Prof. Wolff while the map was in preparation.

The Geological Survey of Alabama has issued a report on the geology of the coastal plain of that State by Messrs. E. A. Smith, director of the Survey, L. C. Johnson, and D. W. Langdon, jr., in an octavo volume of 759 pages with a good number of illustrations. It gives an elaborate account of the successive strata of the plain, all gently dipping southward towards the Gulf, with a total thickness of over 5,000 feet. Brief local account is given of the characteristic topographic features of the plain —especially the inland belt of lowland eroded on weaker strata, and enclosed by the Chunnenugga ridge of harder strata; but no adequate explanation of this feature is presented.

The 'Geographical Work of the Future' is the subject of a suggestive article by Mr. H. R. Mill in the *Scottish Geographical Magazine* for February. After passing in review the various regions yet unexplored, he shows by the diagram of a pyramid the relations of the different departments of the science, the cap and keystone being commercial geography. The discussion and coördination of the classes of phenomena in these he contends will be the work of future geographers. Other papers are a review of Dr. A. Penck's 'Morphology of the Earth's Surface,' by Prof. J. Geikie, and an account of the highest village of the Caucasus, which leaves a favorable impression both of the welfare and the morals of the mountaineers.

Petermann's Mitteilungen for January opens with an article introductory to the publication of extracts from the diary of the late Dr. G. A. Fischer, describing his expedition into Central Africa for the rescue of Dr. Junker. It is accompanied by a fine map of the German and British East African possessions between Mt. Kenia and the Victoria Nyanza. This is followed by a report of the progress in the exploration of eastern Turkestan by the expedition of the Imperial Russian Geographical Society, and a summary of the observations made at various stations in Europe of the earthquake in Japan in March, 1894.

The sixth international geographical congress will be held in London next summer, under the auspices of the Royal Geographical Society, the session beginning July 26 and lasting to August 3. An extensive exhibition of geographical materials will be opened in connection with the congress. The invitation circular, lately issued, announces an imposing list of honorary officers, and a series of strong committees on the various subjects that are proposed for special discussion. The meeting promises to be an important one, and worthy to form the main object of a trip abroad. Full information concerning application for membership may be had of the Secretary, Royal Geographical Society, No. 1 Saville Row, London, W.

A loan collection of portraits of women is to open in Boston on March 11, by way of sequel to the very successful exhibitions in London and New York. Although Gainsborough, Reynolds, Sir Peter Lely, Romney, and other English artists will be represented, and examples of the best painters of the modern French school will be shown, the strength of the exhibition will be in the Copleys, Stuarts, Allstons, Smyberts, Trumbulls, and other painters of their time, besides all the well-known artists of the present day. The collection of miniatures of all schools will be especially interesting and valuable. Only one man is to be shown in the collection, viz, Copley, in a miniature by himself.

The Notman Photographic Co., Boston, sends us an admirable portrait of the late Frederick Douglass, taken at a recent date. One could not desire a better expression of the character of this remarkable man—his fine and venerable presence, his intellectual weight and shrewd humor, the kindly eye, the oratorical mouth. His sitting attitude is easy and dignified, and the whole aspect is that of the gentleman that he was. The print is somewhat larger than the ordinary cabinet size and more nearly square, and is valued not excessively at one dollar.

—If readers were in proportion to practical claim on their attention, the best-thumbed paper in the current number of *Harper's Magazine* would be the one on "The New York Common Schools." The reforms needed in the unwieldy system by which these schools are managed were pointed out as long ago as 1858 by a precursor of Mayor Gilroy's commission of 1893; as they were defeated then by the Board of Education, neglect of the first principles of public administration has since distinguished this department of public work. Where power is divided as it is here—between ward trustees, commissioners, inspectors, and State and city superintendents—responsibility naturally falls to the ground. The "accepted formula used in making scientific skill and knowledge available for the good of the community" is also here a dead letter. Laymen not only control expenditure and prescribe the scope and purpose of the work, but provide the classification of studies and scholars; and educational experts are, though "pedagogy has become a science and the managing of public schools an art," ruled out of the city's educational work. To bring to public hearing, now that reform is again in the air, the principles on which it must proceed, is to perform another of those thankless tasks by which public apathy is sometimes overcome, oftener not. A rider to this paper is contained in the Editor's Study, where some timely words on the habit of attention as a form of mental discipline are enforced by a description of the methods by which the habit has been cultivated with remarkable success in a girls' school. St. George Mivart takes in another paper the hopeful side of the vexed question, "Can acquired character be inherited?" and Mr. Howells contributes to the number an allegorical poem, "Society," in the form of two sonnets of antithetical social imagery.

—In the *Century* Joseph Pennell begins another set of impressions of places, seeking this time his fresh woods and pastures new "Beyond the Adriatic," in company with Harriet Waters Preston, who plays verbal cicerone to the reader in the transit between Fiume, Zara, Sebenico, and Trau, on their bright quays and in their market-places and churches, breaking off within sight of Spalato. Miss Preston makes notes of this and that, and jots down one thing after another in an easy, flowing hand, without special peculiarity of stroke or flourish; but Mr. Pennell's pictures of landscape and architecture combine delicacy and breadth, prettiness and vigor in a manner that stamps their authorship at a glance. "Jean Carriès: Sculptor and Potter," is written

about by a panegyrist, Émile Hovelaque, in a strain plethoric in adjective and unshackled in simile. Nevertheless, Carriès, the inventor of a new earthenware, *grès*, whose exhibit in 1892 of works in bronze, wax, and pottery obtained for him, at the demand of his fellow-artists, the cross of the Legion of Honor, and who died untimely last July, at the age of thirty-eight, emerges from eulogy a singularly interesting figure, a workman of the mediæval type, and an artist (amply illustrated here by reproductions) of spontaneous creative imagination. Mr. Bunner undoubtedly weakens the force of his onslaught upon the novelist who writes with a moral purpose by his illustration of the plain man who, expecting to be interested during the dull hours of a journey "in the joys and sorrows, ups and downs of other human beings not unlike himself," finds himself able to understand "but little of the spiritual struggles of the personages of his book." There are still other human beings, however, who find spiritual struggles the most vital dramas of life; and the plain man, whose "moralities are of a simple, practical sort," obviously needs a guide at the book-stall. To demand that all novels shall be written down to his comprehension is to take a step in literary levelling as yet in advance of the time.

—The first paper in *Scribner's* is also the first of a series which will be continued through the year by the President of Brown University on the "History of the Last Quarter-Century in the United States." In this history the reader is to go, he is told, "upon a rapid excursion through vast tracts, with frequent use of the camera, and not upon a topographical survey." This forecast accurately defines the defects of the plan upon which the history, thus far, is written. Vague apprehension and an indefinite topography suffice, in general, to satisfy the lax interest of the ordinary mind. Espe cially do they so in regard to the principles that underlie our particular institutions and their practical application to concrete problems. The true function of the periodic literature that treats of these is to disseminate definite and precise ideas, even at the necessity of presupposing some patience on the part of the reader. Bird's-eye views and kodak methods are not likely to accomplish this aim. William F. Apthorp's article on "Orchestral Conducting and Conductors" is one from which the tyro in musical knowledge may derive a new point of view in regard to the office and evolution of the modern magnate of music, whose two-fold temptation is, it is shown, to exagge rate the effects of a score or to infuse it unduly with his individual musical temperament. That such temptation increases with the composer's increasing tendency to express himself less and less fully in his notation, and to leave more and more to the conductor's, or performer's, interpretation, can be easily understood. The eternal necessity for unity and symmetry of musical form is a capital theme on which to dwell when excitement and overstimulation are sought in music no less than in other fields, and when such catchwords as "barrier-spurning subjectivism" have found their way into musical discussion. "Bedding-Plants," by Samuel Parsons, jr., is an article full of healthful and pleasant suggestions, accompanied by attractive illustrations from photographs taken by the author's direction.

—The contents of the *Atlantic* are, in part, a pleasant bit of blank verse; the clever first half of a charmingly conceived story; and the prettiest possible sketch of a locality in southern Calabria. The verse, which is by Clinton Scollard, describes "Evening in Salisbury Close"—as it may be seen by some eyes at some times; the story, by Grace Howard Peirce, has for heroine a high-born maiden in the Reign of Terror; the sketch, by Elisabeth Pullen, bears the aptly adapted title, "Bova Unvisited"; and all combine, in the order named, graces of imagination with no less noticeable graces of expression. Prof. Lanciani makes interesting popular reading out of the specialists' explorations of the seats of the Roman oracles, and supports thereby his plea for Rome as "the best centre for the study of practical archæology." For students of social problems, or for the small minority that affects enlightenment on social subjects, H. Sidney Everett's article, "Immigration and Naturalization," covers important points, especially directing attention to the neglect of legislation concerning aliens as at the root of dishonest and wasteful mismanagement of municipal affairs. Equally serious in import is Prof. Shaler's discussion of the "Direction of Education." Although its immediate practical end is an increase of co operation between masters of fitting-schools, public and private, and college authorities, with a view to the better development of the student's individual capacity, the argument by which this end is introduced is so broadly human, and involves so much social forethought, that any reader's thinking may well be stimulated by its perusal.

—M. Victor Turquan contributes to the *Réforme Sociale* an interesting study of the movements of population in France from 1846 to 1891. The number of inhabitants increased from 35,400,000 in 1846 to 38,067 000 in 1866. In consequence of the war with Prussia and the loss of the provinces of Alsace and Lorraine, it fell in 1872 to 36,103,000, rising gradually to 38,343,000 in 1891. From other sources we learn that in 1893 the number of births slightly exceeded the number of deaths, after having fallen below it for several years, so that the population is probably now somewhat greater than in 1891, especially as there has been a perceptible increase in the number of marriages. It is thought that this increase is due to the cessation of the influence of the mortality of the war of 1870 upon the marriage-rate, from which it may be inferred that, if peace is maintained, the number of marriages will continue to be in excess of the average of 280,000 per annum for the decade 1881–1890. It is to be considered, however, that the number of divorces shows a steady increase, and that the number of illegitimate offspring has attained the highest figure ever known, the percentage being 8.8. Moreover, the increase in population in 1893, so far as it is shown by the excess of births over deaths, is confined to the female sex, the number of males having actually diminished.

—M. Turquan's researches bring to view the operation of other causes which may in time affect all inferences drawn from movements of population in the past. Chief among these is the tendency to aggregation in cities, where the birth-rate is lower, at the expense of the country, where it is higher. The line between rural and urban communities in France is drawn with reference to the existence of a concentrated population of 2,000 souls; that is to say, even if a commune contains more than 2,000 inhabitants, it may not be classed as urban if this population is scattered, and not gathered about a centre. It appears that in 1846 the rural population numbered 26,753,000, while in 1891 it had decreased to 24,032 000. On the other hand, the urban population rose from 8,646,000 to 14,311,000. Representing the movements with a diagram, we have two steadily converging lines which will meet about 1925 or 1930, when the urban and rural population will be equal. By very elaborate investigations M. Turquan determines that between 1886 and 1891 the deaths among the urban population exceeded the births by 1,129, while among the rural population the births were in excess by 191,744. But the urban population increased in numbers during that time by 518,000, while the country population diminished by 585,000; indicating a net immigration to the cities from the country of some half a million souls. The minor discrepancies in the figures are explained as due to an excess of emigration of Frenchmen from France over the number of immigrants from foreign countries. In order to fix more precisely the directions of these movements, M. Turquan computes the numbers of communes of various sizes at the different periods under review. There has been a considerable increase, even of recent years, in the number of very small villages; *i. e.*, those of less than 300 souls. There has also been a notable increase in the number of communes having over 5,000 inhabitants. Communes having from 300 to 5,000 inhabitants have materially diminished in numbers; some of them having risen above the 5,000 limit, but more having fallen into the lower grades. The gain in population appears, therefore, to have been made almost exclusively by some 400 or 500 cities, at the expense of the small, but not the smallest, towns. It would be interesting to compare these results with the movement of population in the United States; but we fear that our census has been so mismanaged as to deprive inferences from its reports of all scientific value.

—An important function of the new parish and district councils in Great Britain is the increased opportunities they offer to women for public service. After twenty years, the number of Englishwomen who had secured places on the Poor Law Boards amounted to only about 200: at one bound this feminine contingent has nearly doubled. Indeed, nothing shows more clearly the conservative temper of the average British voter than the disparity in numbers between the women returned, in the recent local elections, as parish councillors and those returned as district councillors—the difference being as 1 to 10. The duties of a parish councillor have yet to be generally accepted as falling within the province of woman's experience, while it is quite otherwise as regards the duties of a poor-law guardian, which in future in rural districts will be discharged by the district councils. The proportion of women returned at the head of the poll is large: out of a group of 458 women candidates (outside of London), 377 were elected, "10 per cent. without contest, and 20 per cent. at the head of the poll," while in most cases women who had been serving as guardians, etc., were reëlected. At Girton Parish (Cambridgeshire) the junior bursar of Girton College, Miss Jackson, heads the list, a similar honor falling to the wife of the rector of Lanivet (Cornwall) in the election of district council. Old Boston (Lincolnshire) has returned Mrs. Bedford, treasurer of the Woman's Liberal Association, and at North Burley (York) Mrs. Priestly, the honorable secretary of the Low Moor Women's Liberal Association, distanced all competitors by 300 votes; at Morpeth (York) two ladies received 410 and 391 votes respec-

tively, the best male running having only 175. Among other successful heads of polls may be mentioned Mrs. Leopold de Rothschild, Miss Twining, Lady Elcho, Lady Jackson, the Lady Mayoress of Leamington, and the Countess of Warwick.

—Dent's edition of Malory's 'Morte Darthur' (New York: Macmillan), the first volume of which we noticed at length some months ago, is now completed by the publication of volume ii. We have little to add to our former notice. Except for the Introduction by Prof. Rhys, on which we have already commented, the work contributes nothing to the textual or literary history of the 'Morte Darthur.' The footnotes are quite as sporadic in the second volume as in the first, and the "General Glossary" (of five pages!) usurps a name it does not own. As a drawing-room edition, however, the book is decidedly successful. The paper and the printing are a positive delight; the mere blackness of the ink is a source of physical and moral pleasure. As for Mr. Aubrey Beardsley's "designs," they are neither better nor worse than in the first volume. They have the same merits—merits of which the public has heard enough from the eccentric artist's admirers—and the same glaring defects. Among the latter we count as almost the least the queerness and ugliness of some of the pictures; it is their occasional flippancy and shallowness, and their more than occasional irrelevancy, that most offend one. As decoration they are often effective; as illustration they almost always fail. We doubt if Mr. Beardsley has, or cares to have, any understanding either of the Arthur legend itself or of Sir Thomas Malory's rendering of it. Nor can we believe that he really intended to *illustrate* the book. The title-page comes near the facts: "embellished with original designs." Some of the subjects selected for these embellishments show how little the artist concerned himself about the story in comparison with his interest in effects in black and white. "La Beale Isoud at Joyous Gard" is an example—a superb piece of decoration, which throws no light on the story, and in itself means no more, perhaps, than "the pride of life." Even more disappointing is the lack of imaginative veracity shown in "How Sir Bedivere Cast the Sword Excalibur into the Water"—a design which in other respects has much merit. As for the chapter-headings, we continue to like them in the main, but some of the gaunt figures are tiresome.

—'Florence,' by MM. Lafenestre and Richtenberger (Paris: Quantin) is a compilation based chiefly on the official catalogues of the various picture galleries at Florence. Occasionally a reference is made to the opinions of Crowe and Cavalcaselle and of Bode. A laudable feature is copious quotation from Vasari, and the history of the vicissitudes of the various pictures has also been attended to in a praiseworthy fashion. The hundred phototype illustrations have been chosen, on the whole, with great tact. A number of pictures in the Pitti and Uffizi, as, for instance, the "Pico da Mirandola," the tiny "Madonna with Music-making Angels," "The Religious Allegory," and the "Portrait of Luigi Cornaro," are still entered by the authors as by an unknown Tuscan, by Titian, by Basaiti, and by Titian respectively, although in the galleries themselves the labels have already been changed, in obedience to modern criticism, to Botticelli, Correggio, Bellini, and Tintoretto respectively. The necessary information given about the painters betrays on the part of the compilers lack of acquaintance with recent research. The date of Gentile da Fabriano's death, for instance, is given as "about 1450," although documents establish that he was dead in 1430; Lotto's birthplace is given as Treviso, although it has been proved again and again that this artist was born in Venice. But, whatever its faults, the book serves the purpose at least of an inexpensive souvenir of the pictures at Florence.

THE APPROPRIATION OF LAND.

Land Systems of Australia. By William Epps. London: Sonnenschein; New York: Scribners. 1894.

THE establishment of property in land has always been one of the most troublesome problems of civilization, and a history of the various theories and expedients adopted in securing peaceable enjoyment to the occupants of definite portions of the surface of the earth would be a library in itself. From the point of view of abstract justice, as it appears to Henry George and as it appeared to Herbert Spencer before he discovered what was involved in the opinion, every human being is entitled to an aliquot part of the inhabitable surface of this planet. The first stumbling-block encountered by this theory is the existence of independent sovereign governments. Whatever titles these governments recognize among their own subjects, they do not admit that the soil within their jurisdictions can be possessed by aliens. Still more serious is the difficulty arising from the expenditure of labor and capital upon land. Most men recalcitrate at a theory of justice which does not recognize claims for "unexhausted improvements"; but if the new-born babe is required to purchase his aliquot portion of land at the cost of the improvements that have been made upon it, his right becomes of a very shadowy character. And finally the institution of the family complicates the case hopelessly; for it will never be generally admitted that children have not a peculiar claim to the possessions, landed or other, of their parents.

Most societies, finding it impossible to comply with the requirements of natural justice, have cut the Gordian knot by getting the land as speedily as possible into the hands of private owners. Once there, the operation of the laws of alienation and devise brings about a constant readjustment, which, however far from ideal justice, makes the system at least tolerable. We are approaching this condition in the United States, since there is now little really desirable agricultural land open for settlement under the homestead acts, although there is an immense area of arid land which can be used only for grazing, but which the Government has hitherto refused to make available for that purpose. Sooner or later, however, the Government will be compelled to legislate concerning this land, and when that time shall arrive, the experience of the English colonies in Australia will be found to afford many useful precedents and many grave warnings.

Mr. Epps's book is therefore of value to American readers, and although the multitude of details necessarily makes it painful reading, many of its lessons and conclusions are too important to be uninteresting. He takes up the legislation affecting land tenure that has prevailed in New South Wales, Tasmania, Victoria, Queensland, Western Australia, South Australia, and New Zealand; a method necessary to completeness, but which involves much repetition. It will suffice for our purpose to glance briefly at the experiments which have been made by New South Wales and New Zealand, and to consider the difficulties with which they are at present confronted.

New South Wales was first settled by convicts transported from England, and for many years leases were made by the Government only on condition that the lessee employed convicts in proportion to his holding, while all settlement beyond certain narrow limits was prohibited. The introduction of grants in fee at fixed prices, and afterwards at auction, caused a rapid alienation of land, and the abolition of the system of transportation in 1840 made the colony more attractive to free immigrants. The appropriation of land through sales at auction was conducted in the first place according to the "Wakefield system," the theory of which was that only small contiguous areas should be disposed of, at a high price, the proceeds to be applied to bringing in agricultural laborers. But the theory collapsed before the rush of the "squatters." In spite of the prohibition of the Government, settlers pressed on beyond the prescribed limits, and formed a community outside of all laws. Many of these squatters were convicts, and, whoever they were, the Government was impotent to prevent their crossing an imaginary line 500 miles in length, or to bring them back after they had crossed it. There was nothing to do but to make the best of the situation, and the squatters obtained legal recognition of their right to the use of grazing-lands upon payment of a small license fee. Attempts were made from time to time to compel the squatters to purchase a part of the lands which they occupied, while the squatters tried to get their tenancies converted practically into estates in fee. In 1847 a system of leasing was adopted which resulted in the most frightful speculation and corruption, many of the squatters finding that the lands occupied by them had been leased by Government officers; and as these leases carried with them a right of purchase, great tracts of land available for settlement passed into the hands of absentee landlords.

These leases, however, proved to be feeble muniments of title. Under the influence of the popular outcry against land monopoly, acts were passed in 1861 providing for the "selection" of lands as homesteads, and for the leasing of pastoral lands for short terms. These acts were, according to Mr. Epps, "the cause of more heart-burning, public immorality, and private chicanery and class antagonism than any measures ever passed in Australasia." Upon the one hand, these laws enabled the "selectors" to blackmail the squatters by selecting such portions of their "runs," especially those bordering upon the streams, as were indispensable to the use of the remainder, and by impounding their cattle. Upon the other hand, the squatters were enabled to buy up the selected tracts or to select them for themselves through "dummies." Under the law as amended in 1875, a family of five persons above the age of sixteen years could take up 12,000 acres. The fundamental vice of the law, as declared in the report of the land commission of 1883, was that "it offered for sale to one class of occupants the same land which was simultaneously assigned under lease to another class."

The system has been improved during the last decade, but it still fails to give satisfaction. Between 1861 and 1891 the urban population increased from 160,000 to 730,000; but

the rural population increased only from 190,000 to 388,000. Between 1879 and 1891 the area of estates under 200 acres scarcely increased at all, while the area of those of 1,000 acres and upwards more than doubled. The average size of estates has increased from 315 acres in 1876 to 816 acres in 1892. Of the total area occupied as freehold, only 2 per cent. is under cultivation—less than half of 1 per cent. of the total area of the colony, and little more than one acre per head of the population. The value of agricultural produce is declining, and the quantity is altogether insufficient for home consumption. It would seem from these figures that the pastoral industry is ordained by nature for this colony, while the efforts of legislators have been directed towards discouraging it. Even this industry is now threatened, since the introduction of rabbits a few years ago has been followed by their prodigious multiplication, to the ruin of pasturage; the graziers being unwilling to incur the expense of protecting leaseholds whence they may be presently evicted without compensation for their improvements.

We have left ourselves little space to describe the history of land tenure in New Zealand, although, when we consider that the early settlers were established under the auspices of the Church of England and the Free Church of Scotland, it is evident that an interesting comparison might be made with the convict settlements of Australia. To some extent we find a repetition of the experiments and blunders of New South Wales, but we can comment only upon some recent legislation. Prior to 1892, lands were leased, in perpetuity, but subject to periodical reappraisement of rent, with the idea of securing to the state the "unearned increment." Since that date, however, leases are made for 999 years at 4 per cent. of the value at the time of selection, the "single-tax" theory having as to this feature collapsed. But the most important innovation is that which forbids any man holding 2,000 acres of land to acquire any more of the public domain. Furthermore, there is a special tax upon non resident landowners, and a graduated land-tax intended to disintegrate large estates, in addition to the regular tax upon land. This graduated tax is imposed upon land valued at over £5,000, after deducting the value of improvements, but not mortgages, rising from one-eighth of a penny in the pound to fifteen times that rate upon valuations over £210,000. When we consider that of the total freehold area of 12,410,000 acres, not less than 7,026,000 are owned by 584 persons, that of the remainder 1,075 persons hold 2,144,000 acres, while the 3,240,000 acres left are divided among 41,518 owners, it is not surprising that a policy hostile to such aggregations of property should find favor. The results of this policy are awaited with eagerness by the other Australasian colonies, nor will they be without interest for the older nations of the earth.

Much credit is due to Mr. Epps for his indefatigable labor in collecting and arranging a mass of inaccessible materials in such a manner as to enable us to understand this interesting phase of the development of the institution of property. It is to be hoped that his work may attract the attention of our legislators, who have yet to deal with the problem of disposing of the arid grazing-lands of the United States, which constitute one-third of its area.

BOOKS ABOUT THE STAGE.

Early London Theatres (In the Fields). By T. Fairman Ordish, F.S.A. [The Camden Library.] London: Elliot Stock; New York: Macmillan.

Technique of the Drama; An Exposition of Dramatic Composition and Art. By Gustav Freytag. Translated by Elias J. MacEwan, M.A. Chicago: S. C. Griggs & Co.

Génie et Métier. Par Hippolyte Parigot. Paris: Colin; New York: Dyrsen & Pfeiffer.

Les 36 Situations Dramatiques. Par Georges Polti. Paris: Le Mercure de France; New York: Dyrsen & Pfeiffer.

Le Théâtre à Coté. Par Adolphe Aderer. Paris: Quantin; New York: Dyrsen & Pfeiffer.

Among the books which every earnest student of the drama needs is a treatise describing the English theatre in the time of Elizabeth and James, in which the construction of the playhouses, the organization of the companies, the hours of performances, the arrangement of the stage, and the disposition of the spectators should all be set down in order clearly and simply, with brief references to the authorities relied on for every important assertion. Such a treatise would help us to understand the physical conditions under which the great English dramatists worked, just as Mr. Haigh's invaluable volume on 'The Attic Theatre' enables us to explain for ourselves not a few of the peculiarities of the Greek drama, and just as the late Eugène Despois's most useful little book on 'Le Théâtre-Français sous Louis XIV.' makes clear to us the circumstances under which the plays of Corneille, of Molière, and of Racine were first produced before the public. A like volume devoted to the Spanish stage in the days of Lope de Vega and of Calderon is also much needed. But to us, speakers of English, using the language of Shakspere as our mother-tongue, a clear explanation of the Shaksperian theatre is a crying need. This book Mr. Ordish has not given or attempted to give us; but he has greatly facilitated the labor of the student who shall undertake the task. Of late years an immense collection of separate items of information about the players and playhouses of England under Elizabeth has been amassed by arduous research under the lead chiefly of that faithful scholar, Halliwell-Phillipps. This information Mr. Ordish has utilized in an attempt to tell the history of the leading theatres outside the city gates—the Theatre and the Curtain being the chief of these; and he intends to prepare a second volume on the theatres within the limits of the City of London. Perhaps the prime merit of the present work is that it brushes aside boldly the reckless misstatements of John Payne Collier, and leads us back again to the actual records which Collier was willing to treat as cavalierly as possible.

The influence of the physical conditions of the theatre of a country upon the form of its drama cannot but be enormous; and yet very few critics have given due weight to it. That the Greek drama differs so widely from the Spanish, and that the English drama of Elizabeth contrasts itself so sharply with the French drama of Louis XIV., is due in part, no doubt, and perhaps chiefly, to the differences of race and of time; but it is due also in great measure to differences in the physical conditions of the theatres for which Sophocles and Calderon, Shakspere and Corneille wrote their plays. It is quite impossible that the Greek and the Spaniard, the Englishman and the Frenchman, should use the same technic, however much they might be in agreement as to the fundamental principles of dramatic construction. That they are in substantial agreement in the use of certain principles there is no doubt; and it is to a discussion of these generally accepted principles that Freytag devoted his 'Technik des Dramas.' Freytag had the advantage of being himself a working playwright, considering the stage from the inner side of the footlights, and having, therefore, a keener sympathy with dramaturgic difficulties than is possible to a merely academic critic. He drew his examples chiefly from the Greek drama, from Shakspere, and from Lessing, Goethe, and Schiller, ignoring the drama of Spain and France, for the most part. From a sentence in the introduction it may be inferred that Freytag is not acquainted with the remarkable verses of Lope on the 'Arte nueva de hacer comedias.' Mr. MacEwan's translation is fluent in the main, although it seems forced now and then; and he has apparently not troubled himself always to verify the original English which Freytag cites in German; thus, we find that the *Friar Lawrence* of "Romeo and Juliet" appears (on p. 33) as *Lorenzo*.

Closely akin, in some respects, to Freytag's book is M. Parigot's collection of essays, in which the intent is to show how much skill and craftsmanship underlies genius. Every man must serve his apprenticeship if he wishes to be a master of the craft. The genius can shorten the years of service and can learn the trade more swiftly than his less-gifted rivals, but sooner or later the trade has to be learnt, for all that; and the great dramatists of all times and peoples have all of them been cunning artificers. Merely as playwrights, seeking how best to make a play please, amuse, interest, entertain an audience, Sophocles and Shakspere, Molière and Ibsen have had few rivals. Corneille is the master of the technic of the drama whose processes M. Parigot has chosen to study and to expound to us; and his analysis is most illuminative, and makes clear phases of Corneille's art not hitherto plain to us. Akin to this study is an extremely interesting discussion of the relation of the vaudeville, the comedy of ingenious intrigue, with the larger comedy of manners, in which M. Parigot shows that, even in the best comedy of manners, construction plays a very important part. Another instructive paper gives us many new facts about the original manuscripts of the younger Dumas's plays, showing how the playmaker and the phrasemaker, both of which are in M. Dumas, contended for the mastery, and how the playmaker finally conquered the phrasemaker.

In one of his conversations with Eckermann, Goethe said that Gozzi, the Venetian dramatist, had declared that there were only thirty-six possible dramatic situations, and that Schiller had tried hard to find more, but he could not make out even as many as Gozzi. This chance saying of Goethe's is the text of M. Polti's volume. M. Polti has analyzed some thousand plays, and he has made a list of what seem to him to be *the* thirty-six situations he found therein; and under one or another of these main situations, with their several varieties, he has been able to classify all the situations in all these plays. A limitation of the number to thirty-six is arbitrary, of course, and another investigator might easily have arranged the results of his research under twenty heads or under fifty. Perhaps, also, Mr. William Archer is right in thinking that M. Polti has erred in attempting a classification by the situation, which is

the mere outward expression of an emotion, instead of a classification by the emotions themselves. None the less is M. Polti's labor not without interest. He has enabled us to see that certain situations were often used by the Greek dramatists, and are now almost wholly neglected by modern playwrights. He shows us that certain other situations seemingly fertile in dramatic effect and in histrionic possibilities have been most insufficiently attempted at any time. He gives us added evidence, were any really needed, to disprove Mr. Swinburne's assertion that Victor Hugo is a great dramatist of the race and lineage of Shakspere. That is to say, under his Situation XIX. "To kill one of his kin unknown" (to be found in the "Ion" of Euripides, the "Merope" of Alfieri, the "Mahomet" of Voltaire), he finds it easy to classify all of the ten plays of Hugo, and he discovers variants of this situation actually five times repeated in the single play of "Lucrèce Borgia." Yet such a situation must be very rare indeed in real life; and it does not occur once in all the thirty-nine plays of Shakspere, who preferred to deal with stronger subjects than a situation as accidental as this.

While M. Francisque Sarcey is the regular dramatic critic of the *Temps*, that best and most dignified of Parisian journals, contributing a long and elaborate review of the week to the paper which bears the date of Monday morning, although it appears on Sunday afternoon, the daily theatrical notes, items of gossip, bits of news, "first-night" impressions, are the work of M. Adolphe Aderer, who also from time to time contributes longer articles on subjects connected with the stage. For the *Temps* he recently prepared a series of papers describing the many organizations now existing in Paris for the purpose of giving occasional performances of new plays; and these papers appear now in a volume with a prefatory note by M. Sarcey. It needed a volume like this on 'Le Théâtre à Coté' to enable a foreigner to understand the prodigious theatrical activity of France. In addition to the regular theatres relying almost wholly on the contemporary French dramatists, and very rarely indeed producing any adaptation of any foreign play, there are also at least a dozen really important societies—of which the "Théâtre Libre" is the best known, and the "Cercle Funambulesque" (for reviving the delicate art of French pantomime) is the most original—there are at least a dozen societies giving perhaps half-a-dozen performances each during the winter, at each of which performances only new plays are acted. To any one interested in the contemporary drama M. Aderer's little book is most instructive. It is a great pity that the projectors of the unfortunate "Theatre of Arts and Letters" here in New York had not possessed the taste and the tact which more than one of the directors of these Parisian analogues has given proof of.

A History of Egypt: From the earliest times to the Sixteenth Dynasty. By W. M. Flinders Petrie, D. C. L., Edwards Professor of Egyptology in University College, London. With numerous illustrations. London: Methuen & Co. 1894.

To most readers the fact would be of small significance that unmummied bodies have been found in Egypt, buried in a crouching or bent position with their faces toward the east. Similarly, it would awaken no interest to be told that a scarab of an uncertain king was ornamented by a "discontinuous scroll" and by "vertical lines down each side of the name," and also that the circle which is used in the writing of the same king's name contained two transverse marks. Even to the average person interested in Egyptian antiquities, the exact location of a place called *Hat-Nub* would appear to be of decidedly minor importance. Yet these are three points brought out by Prof. Petrie because they have very important bearings upon some of the hardest problems that face the student of Egyptian origins, history, and chronology.

A difference in burial customs points to a difference of religious belief and practice, and hints at a difference of race and previous ancestral home. Relations are found to exist between the Egyptians and the inhabitants of Punt, a land on either side of the Red Sea at its southern end—the Somali coast and southern Arabia. Further investigations seem to indicate that these peoples originated in the Persian Gulf region, and that they spread thence, passing up the Red Sea, a portion of them branching off to Egypt by way of Kosseir and Koptos, settling first at Thinis and thence descending to Memphis, and the rest proceeding northward to Phœnicia and thence westward along the shores of the Mediterranean to northern Africa and even to Spain.

One of the dark periods of Egyptian annals is that between the seventh and the tenth dynasties. Prof. Petrie finds a cause for a part of the uncertainty in the fact that the royal power fell into gradual decay during the seventh and eighth dynasties, so that, at the close of the eighth dynasty and during the ninth and tenth, the land was governed by territorial princes and local rulers, over whom finally a foreign king gained supremacy. The name of this king has generally been read as Ianra or Iannias, and he has been identified with one of the Hyksos rulers mentioned by Josephus. The circle with the two transverse lines mentioned above differs from a circle with a central dot, and this difference makes a change from the name Ianra to the name Khyan or Khian, a formation foreign to Egyptian usage. The peculiar method of ornamentation employed upon a scarab bearing the name of this sovereign, upon which stress is laid, fixes his reign previous to the period of the eleventh and twelfth dynasties, because only then in the whole extent of Egyptian history was this style of ornamentation in vogue. We thus get a glimpse of a period of foreign invasion which seems to account for the retreat of the princes of the tenth dynasty toward the south. This period was like that of the Hyksos invasion, but was long anterior to it.

The bearing of the location of *Hat-Nub* upon questions of chronology is too complicated for treatment here; suffice it to say that it, in connection with other data, serves as a basis for the calculation of the approximate time required to transport stones on a falling Nile from the quarry to the capital, and hence the approximate day of the month when such an operation was undertaken in the reign of Merenra of the sixth dynasty. This enables one to fix the time when a given date fell in a certain part of the Egyptian changeable year, and, by means of reference to its location in a given Sothic period, to translate it into terms of years composed of three hundred and sixty-five and a quarter days. The degree of uncertainty that has reigned in the dates of events in what is called the Old Kingdom has been simply startling, and Erman only stated the fact when he said that a difference of a thousand years might exist between the date assigned to a given event and the time when it actually occurred. But the combination of the astronomical with the regnal method of computation gives us an approximation which is believed by Prof. Petrie to be within a century at the outside. Combined with the system of calculation by "dead reckoning" it is found that a date for Menes, the first king, may be provisionally assigned at about 4800 B. C. (4777). This date differs from that of Mariette (5004) by only about 200 years, while it is nearly 1,000 years below that of Champollion (5867), 800 below that of Wiedemann (5650), 400 above that of Brugsch (4400), and about 900 above those of Lepsius (3892) and Lieblein (3893). The date of Wilkinson (2320) is most "orthodox," but it is more than doubled by Petrie. It is to be noted that the approximate nature of this assignment is insisted upon with reiteration by Petrie; but that it indicates a long step in advance is undoubted.

The volume under consideration is the first of six, which are to cover the Dynastic, the Ptolemaic, the Roman, and the Arabic periods of Egyptian history, and in the last two Prof. Petrie is to have the coöperation of J. G. Milne and Stanley Lane-Poole, respectively. When completed, the series will present the best compendium of Egyptian history for the use of the student in English, if not in any language. That of Brugsch is brilliant, but it is padded with much that is conjectural or rhetorical. That of Wiedemann is simply invaluable, and will remain so on account of its multitudinous details. The present volume is somewhat on the plan of Wiedemann, but is more condensed in parts and in others supplemented by the results of years of research expended by Petrie himself in the land of the Nile. He has also improved upon his predecessor by giving a large number of illustrations, and also the hieroglyphic forms of the names of many of the Pharaohs. Mariette's 'Aperçu' (translated by Brodrick) is merely a brief outline, which is in part superseded already, and this remark denotes the fault to be found with most histories of the Pharaohs that are ten years old and upwards. The best previous history is that of Eduard Meyer, and it is not superseded entirely by that of Petrie.

There are those who will think that Prof. Petrie has not been wise in his treatment of proper names. It may be slightly more correct to write *Tahutmes* than *Thothmes*, but the gain is not very marked, and the second form has the right to the ground by long occupation. But in writing the first form the author departs from the general usage of the book, and is inconsistent either way. But this, though not at all an isolated case, is only as a "grain of sand in the marble of the Parthenon." He has arranged his material in a perspicuous way, has illustrated his work quite profusely, and has made the ground of chronology more firm. Succeeding volumes will be looked for with interest by students of Egyptian history, because they come from masters. For popular reading, in the ordinary sense, the present volume is scarcely adapted because of its detail, but the sections which summarize whole dynasties or periods are brief, clear, and good, so that the outline of the history is easily available to one who wishes to skip the facts of single reigns.

General Hancock. By General Francis A. Walker. [Great Commanders.] D. Appleton & Co. 12mo, pp. 332.

GEN. WALKER frankly states that the inclusion of Gen. Hancock's name in a list of "Great

Commanders" must be regarded as an enlargement of the natural meaning of the title, since his service was always subordinate, and he was never subjected to the supreme responsibilities of the leader of an independent army in the field. Still, all who admire a splendid soldier will be glad to have any phrase made elastic enough to include a career which was a model for nearly everything that a brave and patriotic officer would desire to be and to do. In every part of his war service he bore himself so that he was naturally looked to as one fit for the next step in promotion; and we are not called upon to decide whether he would have been equally brilliant if the last test had been applied, and he had been appointed to lead a great army.

Born of intelligent parents in Pennsylvania in 1824, he entered the Military Academy at sixteen and graduated in 1844, just before reaching his majority. Of powerful physique and fine presence, his bent was towards the active and athletic side of a soldier's life. In intellectual work he does not seem to have advanced beyond the lower third of a class no way greatly distinguished. This forces on our attention the fact that the business of the soldier is fighting, and that the qualities that brought Hancock a great harvest of glory in the fierce struggle at the Spottsylvania salient were not necessarily those which secure a high academic standing. There must, of course, be the ordinary education which fits a man for the not inconsiderable business of a corps command; but the essentials, after all, were unflinching courage, perfect presence of mind in the midst of the most startling dangers, the tenacity of will which does not accept defeat, the power to infuse his own heroism into others, and the common sense which fully comprehends the problems of a field of conflict not too large to be within the scope of actual vision. Accomplishments of every sort may adorn the soldier, but the characteristics which make success sure in the larger positions that are still subordinate, are those which are thus indicated; and all these Hancock had in a remarkable degree.

He had another trait which was by no means so common as one could wish. He was cheerfully and heartily obedient to those placed over him in command. His was no perfunctory obedience which was willing to do only the thing commanded. He took in the full spirit of his orders, and was willing to go any length in making their execution a success, without sticking in the letter. This gave him the solid place in the confidence and esteem of Grant and Meade which was repeatedly and strongly attested by them.

The warm affection which Gen. Walker feels for his former commander is the natural outgrowth of his war-time relations to such a man. A young staff-officer in the military family of such a soldier would naturally worship the man whom he followed; and when the kindness of heart of the chief and his generous qualities added a sincere personal affection to admiration and loyal attachment, the junior's sentiments would become almost filial. Whatever would seem excessive in the praise which is lavished, becomes thus additional evidence of the noble qualities which could rouse such devotion in the heart of one whose keen and critical intellect has been distinguished in multifarious fields of investigation and administration.

Perhaps a word ought to be said, by way of helping to hold level the scales of historical justice, in relation to Meade's order sending Hancock on the 1st of July to the field of Gettysburg to assume command over Howard, the senior in rank. We are told that in three or four less prominent cases Meade did the same thing. Whether one or several, such orders were illegal in fact, and in an instance arising later, when Sherman issued a similar order with an arrangement by which it was amicably submitted to the War Department, Gen. Halleck announced the decision which explicitly declared that in such a case the senior among the corps or other commanders has the legal right to command, unless the President shall by special action order otherwise. By no implication could the power be exercised by a general in the field. The military hierarchy is fixed by the articles of war, which are part of the United States statutes. The special assignment permitted to the President not only must theoretically be exercised by himself, but was in fact uniformly so done, in a long series of orders of similar tenor to that by which Gen. Hancock received his assignment as corps commander, which gave him precedence over other major-generals not so assigned. They were issued from the War Department "by direction of the President," published "by order of the Secretary of War," and signed by the Adjutant-General of the army.

On the question of fact, whether Hancock did actually exercise any authority over Howard, the statements of the two officers are conflicting, and the disinterested testimony seems to reduce it to a question of form more than of substance. Gen. Walker was absent by reason of wounds received before that time, and therefore does not speak as a witness.

The author is also very frank in notifying his readers that, having published a history of the Second Corps, it has been almost a necessity that he should make free use of this material, adding, however, whatever might be needful to make a full biographical sketch of the striking figure which has the chief place in both books. The story of Hancock's administrative service in New Orleans, his relations to Andrew Johnson's Administration, and his own candidacy for the Presidency, is all told with admirable candor, and the narrative retains its attractiveness to the end. The habit of dealing with census statistics, and of seeking close logical form for the expression of reasoning in economics, has not deprived the author of the power of making a vivid and most effective narrative, full of color and of deep feeling.

My Study Fire. By Hamilton Wright Mabie. Dodd, Mead & Co.

THE faults of manner of this second series of Mr. Mabie's abbreviated essays are largely due to the conditions of their production. Their quality has obviously been adapted to the quality of the audience to which they are addressed, and they suffer in consequence, as the actor suffers who is compelled to play long and constantly to undiscriminating houses. If the groundlings could have been left out of account, and Mr. Mabie had been always stimulated by the consciousness of ears quick to sift the easily fetched paragraph from the genuinely and individually developed thought, the most glaring defects would, there is reason to believe, have been absent from his work. He would presumably have been more chary of generalizations—about the "Attic Greeks," for instance; he would probably never have written such sentences as that about "the tumultuous music of a virile song," and others of its kind; and he would, it is likely, have been more on his guard against quoting authors and others in the heterogeneous fashion of the country people who open a Bible at random to find a text suited to any emergency. More careful trains of reflection—if not a sense of humor—would, there is little doubt, have prevented the putting together of Theocritus and Froebel as twin authorities, or would have made impossible a ridiculous medley like that produced by citing, within the space of ten lines, "Phidias or Pericles or Plato," George MacDonald, Socrates, and Hamerton.

To what the essays teach, on the other hand, no exception need be taken. A writer performs a valuable service when he persistently and plainly tells a restless and excitable generation of readers that intervals of withdrawal from external rush and hurry are essential to their soul's salvation; that without periods of solitude and silence there can be no true mental culture; that "there is something in us which even our ideals must respect, and that something is our own individuality." He is as timely as he is frank when he insists that "to rush wildly with the maddened throng after Browning for one short winter, to be diverted the next season by Ibsen, is to carefully destroy all hope of coming into real contact with either of these writers"; and he shows himself in advance of most of his contemporaries when he tells them that "the eternal charm of beauty lies in its complete severance from all trace of work." Moreover, he becomes not only a profitable, but an uncommon, companion to most readers when his pages suggest, if they do not explicitly say, that it ought to be possible to enjoy the society and even appreciate the wit or wisdom of individuals, without first discovering them to be labelled in large letters as having appeared in print, been prominent in movements, or exhausted a specialty.

Two of the most thoroughly attractive essays in the volume are the first, "The Book and the Reader," in which Mr. Mabie reveals, in a highly agreeable style, the variety and resources of his own mind; and a later one, "A Poet of Admiration," in which a brief sketch is given of the life and verse of Arthur Hugh Clough. Here, instead of the circuitous round, through Mlle. Scudéry, Howell, and Thackeray, which introduces, for instance, "The Lowell Letters," we have the subject presented so directly, with so much vividness and relevancy, that it is the more to be regretted that it is the only paper in the collection which Mr. Mabie has chosen to treat in just this way.

Across Asia on a Bicycle. By Allen and Sachtleben. The Century Co.

THE mere title of this little work shows that we have to deal with a remarkable journey. It is certainly extraordinary that two young Americans should have undertaken, as soon as they had graduated from a university in Missouri, to complete their education by a trip around the world on their bicycles. Of this trip by far the most difficult and interesting part was their ride across Asia, and they have done wisely in confining their narration to that portion of their experiences, though the story is well enough told to have made us glad of a bulkier volume. Starting from Constantinople, they rode across Asia Minor, Persia, Transcaspia, entered China at Kuldja, then crossed the Gobi Desert and the whole empire to Pekin and Tientsin, where the natural conclusion to their adventures was an interview with Li Hung Chang. They overcame mountains and deserts, suffered many hardships as well as occasional breakdowns, and, though they did much walking, seldom availed them-

selves of other means of conveyance than their bicycles. The chief incident not in direct pursuance of their journey was an ascent of Mt. Ararat, which is well described. The little volume in which they relate their experiences is an example of simple, unassuming narrative, while the few general reflections thrown in here and there are unusually sensible. What the travellers underwent is told in such a quiet, matter-of-fact way that one is in danger of forgetting the extreme difficulty of their achievement. Next to the qualities of courage, endurance, and good temper that they must have been continually called upon to show, their success was chiefly due to the boldness and novelty of their enterprise, which excited the curiosity and sympathy of both Europeans and Asiatics, even in China, where—

"Had we been travelling in the ordinary way, not only these favors might not have been shown us, but our project entirely defeated by local obstructions, as was the case with many who attempted the same journey by caravan. To the good will of the mandarins, as well as the people, an indispensable concomitant of a journey through China, our bicycles were after all our best passports. They everywhere overcame the antipathy for the foreigner, and made us cordially welcome."

There are not many people who could and would make such a trip, nor very many who would describe it so modestly if they had done so. The illustrations selected from our wheelmen's photographs are profuse and interesting.

Henry of Navarre and the Religious Wars. By Edward T. Blair. Lippincott. 1895.

THIS very beautiful volume is refreshingly free from all pretence of scholarly merit. It is a simple narration of the fortunes of the very interesting personage who stands at the centre of all the schemes of French parties during the later period of the religious wars. It frankly places the personal element in the foreground, and makes love affairs, court intrigue, and jealousy of quite equal importance with the deeper movement of politics. The same lack of scientific interest is seen even in the treatment of the numerous illustrations with which the book is embellished. Here was a capital opportunity for reproducing contemporary work after the fashion of the Germans, but, instead of this, we have chiefly photographic representations of modern paintings of the "ideal" sort. To crown this childishness, not one of these paintings is furnished with so much as the name of the artist.

BOOKS OF THE WEEK.

A Satchel Guide for the Vacation Tourist in Europe. 1895. Boston: Houghton, Mifflin & Co. $1.50.
Baldwin, Prof. J. M. Mental Development in the Child and the Race. Macmillan. $2.60.
Beach, C. F., Jr. Commentaries on the Law of Insurance. 2 vols. Boston: Houghton, Mifflin & Co. $12.
Bolton, Mrs. Sarah K. The Inevitable, and Other Poems. T. Y. Crowell & Co. $1.
Collins, J. C. Essays and Studies. Macmillan. $3.
Cowell, E. B. The Jātaka; or, Stories of the Buddha's Former Births. Cambridge: University Press; New York: Macmillan.
Dowden, Prof. Edward. Poems by Robert Southey. [Golden Treasury Series.] Macmillan. $1.
Esclangon, A. The French Verb Newly Treated. Macmillan. $1.25.

BY THE AUTHOR OF
THE PRISONER OF ZENDA,
A MAN OF MARK.
A Tale of a Revolution in the Republic of Aurelaland, South America, by ANTHONY HOPE. Narrow 16mo, Buckram, with Frontispiece by Wechsler, 75 cents.

Mrs. Beale's Romance of the Carolina Coast,
JACK O'DOON.
Second Edition. Narrow 16mo. Buckram, 75c.
"There is a maturity of conception, an accuracy of artistic perception not often noticed in an author's first novel. . . . The landscapes are as faithfully definite as only an artist could make them. . . . There is a great deal of vigor in the characterization and no little humor, while the conversation is straightforward and natural. . . . Too much praise can hardly be given to the management of the tragic close of the book. The incidents at this point are very carefully as well as finely narrated. . . . The tale ends precisely where it should do, and this is not one of the least of the several excellences of this delightful story. . . . its fresh wholesomeness . . . deals with life in a healthy fashion."—*Boston Transcript*

Heath's Modern Language Texts
TO BE ISSUED NEXT WEEK:
ZOLA'S LA DÉBÂCLE.
Abbreviated and edited, with Notes, by B. W. WELLS, Professor of Modern Languages, University of the South. Cloth, 292 pages, with a Map. Price, 80 cts.
D. C. HEATH & CO., Publishers,
BOSTON, NEW YORK, CHICAGO, LONDON.

Copeland and Day,
69 Cornhill, Boston.
"POEMS."
By RICHARD GARNETT.
Octavo, $1.50.
"Mr. Garnett is too learned to be simply lyrical, but he has art enough to convey the illusion of intuitive knowledge. His fantasy is profound, his style has vigor combined with gracefulness, and his literary skill is exemplary."—*N. Y. Times.*
"Above all moderns, he has seized or inherited the double dower of the Anthology, its vague crepuscular melancholy, its shy and exquisite roguishness. His instinct of the thinker and the bookman is admirably proportioned, nay, subordinated, to the affairs of humanity."—*Boston Transcript.*
"CUCKOO SONGS."
By KATHARINE TYNAN HINKSON.
Octavo, $1.50.
"In the matter of printing and binding, a little volume of Cuckoo Songs, by Katharine Tynan Hinkson, would surely charm the most fastidious. Nor are the songs unworthy of their exquisite dress. The songs of and about birds, which show a difficult theme well managed, will probably be the oftenest read and best liked."—*Worcester Spy.*

YALE MIXTURE.
The choicest tobacco made, and pre-eminently a gentleman's smoke.
Marburg Bros., The American Tobacco Co, Successor, Baltimore, Md.

The Nation.

NEW YORK, THURSDAY, MARCH 14, 1895.

The Week.

CONGRESSMAN SAYERS, chairman of the committee on appropriations, has prepared the usual comparative statement of the appropriations of the last Congress and of the two preceding ones, Mr. Henderson of Iowa making a similar presentation in behalf of the Republicans. According to Mr. Sayers, the totals are these:

Fifty-first Congress.....	$1,035,680,109
Fifty-second Congress..	1,027,104,547
Fifty-third Congress....	990,338,691

Mr. Henderson's figures agree with those of Mr. Sayers as to the Fifty-second and Fifty-third Congresses. As to the Fifty-first, he makes the amount $988,417,183. Thus, according to Mr. Henderson's showing, the billion-dollar Republican Congress was a little less extravagant than the billion-dollar Democratic one, but the difference is not sufficient to carry a stump orator very far. The principal item in all these tables is that of pensions, which were in round numbers:

Fifty-first Congress.....	$288,000,000.
Fifty-second Congress.....	335,000,000.
Fifty-third Congress.....	293,000,000.

Mr. Sayers shows that the last Congress authorized no new river-and-harbor works, although it was obliged to vote $20,000,000 to meet old contracts, and that while voting $23,000,000 for the new navy on old contracts, it authorized only $8,000,000 of additional work. In the way of new buildings, it authorized only $5,660,000, of which $4,000,000 was for one building at Chicago which was indispensable. The Fifty-first Congress authorized $8,000,000 for new buildings. Mr. Henderson, on the other hand, considers the diminution of appropriations by the last Congress both deceptive and cruel, having been due to a slackening of zeal in pension work. If this work had been pushed with the zeal displayed by Corporal Tanner and his successor in office, the amount called for would have been $20,000,000 greater than it was, and the appropriations would have been the largest of any Congress since the war.

Assistant-Secretary Curtis denies officially the statement published on Friday that the Treasury Department was dissatisfied with the gold deliveries of the bond syndicate under their contract for the supply of coin. It takes so much time to contradict lies in the newspapers, especially those relating to the sale of bonds, that it would be well for Congress to create a new office—that of third assistant secretary—to attend to that business exclusively as long as we have a public debt. He ought also to be put under the civil-service rules, and not be liable to removal with a change of Administration, because experience and alacrity in detecting and exposing fallacies affecting the national finances would be worth millions to the people every year. The Boston *Herald*, for example, says that the "gold payments by the present syndicate are made with much greater slowness in the present settlement than in either of the other adjustments of bond purchases." This is a fallacy. Although not exactly a lie, it has all the effect of one because nine readers out of ten will assume that they are too slow for the public good, and a majority will think that the syndicate are not living up to the terms of their contract. Both of these lurking suggestions are deceptive. Mr. Curtis contradicts both when he says that the amount of gold already deposited on the foreign account is in excess of the contract requirements, that, all told, the syndicate is ahead of its agreed deposits by some $9,000,000, and that the withdrawals of gold by the public since the contract was made have not been in excess of those which are usual at this time of the year. Consequently the fact, if it be a fact, that these gold payments are made more slowly than some former ones, is of no more consequence than the eclipse of the moon or the backwardness of the weather.

The serious risks which the syndicate taking the last Government loan had to face have been steadily decried by our light-hearted financiers of the press and by the lee-shore wreckers. No risk at all, they have affirmed. The loan was certain to go off like hot cakes. Anybody could get $30,000,000 of gold in London by whistling for it, and as for preventing gold exports, nothing could be easier for a person who really gave his mind to it. But the organs of the investing world of London thought differently. The *Investors' Review* broke into ribald laughter when it read of the President's simple-minded belief that the syndicate could control foreign exchange as it had contracted to. Did these American "babes in political economy" imagine that "a compact of this or of any kind with financiers can circumvent the operation of a natural law"? The *Review* was going to have the gold back again as fast as it was shipped here. But two months have elapsed, and not a dollar has been exported. The syndicate has done, so far, exactly what it agreed to. It has not violated any natural law of trade, because it is a natural law of trade that you can prevent gold exports if you are willing to sell bills at a loss. This is what the syndicate appears to have done. On the general question of the loan the *Review* said:

"In the circumstances the British public ought not to relieve the finance houses of a dollar's worth of the 'coin' $62,317,500-loan sold to pay the buyer-syndicate about 3¾ per cent. on the 8th February, and if our insurance companies take it they will rue the day. A United States loan issued abroad under the conditions now dominant there—and to all appearance likely to continue dominant—would be dear at 5 per cent."

Comptroller Eckels contributes to the March number of the *Forum* a timely article on the currency question, the main feature of which is that the Government's legal-tender notes must be retired and cancelled, and that this reform must precede every other. He considers it an encouraging sign of the times that so many men in public and private life are willing to take a positive stand on this question and to work for the promotion of sound principles of finance. We consider it an encouraging sign that the comptroller of the currency himself is fighting for the retirement of the greenbacks. Probably all of his predecessors in office have been of the same mind as Mr. Eckels, but the circumstances under which they administered their offices having been those of an abundant gold reserve, and hence of comparative tranquillity, the time was not favorable for a crusade against the greenbacks. It is favorable now, and Mr. Eckels sets a good example by improving the opportunity.

Lodge's article in the *Forum* on "Our Blundering Foreign Policy" has not the advantage of his pretty map in red and blue, with which he awed the Senate week before last, but it equally exemplifies kindergarten methods of instruction. Children, and, we had thought, children only, need to be told with so much solemnity that bad men are not nice, and that it is a shame not to tell the truth, respect one's parents, and love one's country. This is the burden of his remarks, which will certainly encourage all true patriots by showing them that we have at least one Senator who boldly says he is in favor of everything that will make our country good, great, and glorious, and is unalterably opposed to every public measure that is, directly or indirectly, pernicious and unpatriotic. Lodge plaintively objects to having "Americanism" like his put in "quotation-marks and treated as an opprobrious and dishonoring epithet." But what are printers to do? Must they violate, at Lodge's demand, not only every international law, but every rule of punctuation as well? It is the ordinary rule to put quotation-marks about any word used in an odd, affected, or ludicrous or mysterious fashion; and as long as Lodge's "Americanism" continues to be used in that way, it will get the "double-quotes" every time in all well-regulated printing-offices. It is all very well for him to go to war with Great Britain, but is he ready to take

the responsibility of quarrelling with a proof-reader?

Over another matter connected with the exigencies of printing does the Senator stumble. We refer to the necessity of getting a magazine article in type long before it is finally published. This exposes the writer to the peril of asserting things which he himself and the public find out, too late, to be the things that are not. Thus Lodge affirms in his article that "we have done nothing to check the continued aggressions of the British upon the territory of Venezuela"; but almost on the very day the statement appears it is given the lie by the publication of the Government's annual volume on foreign relations, which shows that the Venezuela boundary dispute has "had Mr. Bayard's unceasing attention," that "his persistence has modified Great Britain's attitude considerably, and that the long controversy is in a fair way to reach a termination satisfactory to all concerned." One thing is certain, if the controversy is settled, it will be passed by hereafter in as stern silence by Lodge as the Mosquito protectorate is, as the successful Chinese and Japanese treaties are. If any miserable un-American critic says this is distinctly unfair and a blunder in a great historical writer, the triumphant answer is ready for him, How can you better expose "Our Blundering Foreign Policy" than by making big blunders yourself?

Senator Morgan, in the intervals of promoting international hatred and bloody wars, is a tender-hearted philanthropist. In an address delivered last January before that ridiculous pro-slavery survival, the American Colonization Society, he expanded his noble breast in sympathy for the oppressed of all the earth. He had his eye particularly on the Armenians, whom he would have emigrate to this country *en masse*. To make room for them he would send all the negroes to Africa, much as he would hate to "give them up," sorely as his "heart would be lacerated if the negroes should go back home." But "there must be partings in the world," and Senator Morgan would arrange the partings and arrivings as follows:

> "I would march a grand procession across the Atlantic Ocean, bearing banners and torches, and singing the songs of rejoicing, composed of five millions of Armenians, and as they come from one shore I would have another procession going from our shores, composed of five millions of negroes returning to their homes. If any man can produce, even out of the most fervid imagination, a picture brighter or happier than that, which stands within the very touch of reality, let him rise and do it. Oh, how proud I would be to contribute my aid in forming that grand procession! How would the nations then again distribute themselves; the Africans bearing our civilization into the Dark Continent, and the Armenians bringing the light of Christianity as it first shone upon the altars, where it can never be extinguished, into this beautiful Christian republic of ours."

We hesitate to set our fervid imagination against the Alabama Senator's, yet we can easily conceive a brighter and happier picture than his. It would be a procession, which he could powerfully contribute his aid in forming, of all the blatherskites and burlesque statesmen out of the Senate, with or without banners and torches, and a procession into it, to take their places, of an equal number of honest and serious legislators. We should be willing to put it to popular vote tomorrow (the negro and Armenian vote barred), which spectacle would awaken the greatest general rejoicing.

Mr. Scott, the corporation counsel, did a public service last week when he declared, in the Board of Estimate and Apportionment, that the low tax-rate of last year about which Gilroy made such a clatter was fictitious, or, in plain language, a fraud. Mr. Fitch, the Tammany comptroller, was obliged to admit that this was the fact, and the president of the Department of Taxes and Assessments, Mr. Barker, was obliged to acquiesce in the same view. It is only a few weeks since Gilroy sailed away to Europe, giving tongue to the last to the old Tammany lie about the low tax-rate, the wealth of New York, and the blessings of Tammany rule. Everybody connected with the Gilroy administration knew it was a lie. As matters stand to-day, nobody knows what the income from the tax levy will be, but of one thing there is no doubt, it will be far from adequate to meet the expenses of the government. That is a Tammany legacy to the city which the taxpayers will have to pay. Next year's tax-rate will have to be raised to meet the deficit, and when it is announced, there will be a great Tammany uproar about the cost of reform rule. It is a great pity that the author of the tax-rate fraud was allowed to get out of the country without a thorough investigation. Enough has been revealed about him already to show that as the one Tammany statesman with a "business record" he was the most blatant deceiver of the whole gang, and if his record in the Public Works Department, both while at the head of it personally and while he had "Mike" Daly at its head as his dummy, could be gone into, we should doubtless discover why it is that he is able to be travelling in Europe for an indefinite period.

A most commendable plan for useful public work for the community between elections has been formulated by Good Government Club O. It is based on the belief that municipal reformers should take a kindergarten lesson in municipal duties before venturing to instruct others, that they should acquire a rudimentary knowledge of the portion of the city in which they live before attempting more ambitious duties embracing the whole community, and that this knowledge should embrace all city departments, beginning first with the housekeeping or street-cleaning of the home district. The first step of the plan is to divide the Fourteenth Assembly District, in which the club is situated, into sections, election districts, and blocks, placing each block in charge of a person living on it, and requiring him or her (for women are to share in the work) to report upwards through assistant inspectors, inspectors, and section leaders to the chairman of the executive committee, who shall make the final report to the head of the Street-Cleaning Bureau or other city department responsible for the work under consideration. It would be difficult to conceive of a more useful field of activity for a Good Government club than this. The idea is to have the work so divided up among many, and so thoroughly systematized, that quick reports can be made and the results placed in the hands of the municipal authorities without delay. Club O intends also to send out circulars to the residents, relative to city ordinances, and instructions for the children of the district to report to their parents concerning rubbish, etc., in the streets, and thus educate the youth of the district in habits of cleanliness. The street-cleaning commissioner will be only too glad for coöperation of this kind, for not only will it help him in educating the public in regard to papers and rubbish in the streets, but it will enable him to put his finger more quickly upon delinquent subordinates in his department who are not properly attending to their duties.

The debate in the English Parliament on Thursday on the non-payment of the Bering Sea claims was temperate and wholly devoid of accusation or reproach, yet it was of a kind not calculated to increase our national pride. Not only was no provision made by Congress for paying the claims, but none was made for carrying out the alternative proposition to have them arbitrated according to the decision of the Paris tribunal. When the House, under the lead of Hitt and Cannon of Illinois, voted against paying the lump sum of $425,000, Secretary Gresham sent to the Senate committee on appropriations, where the deficiency bill was pending, an estimate for $50,000 to pay the expenses of the court of arbitration, which was the next step required by the tribunal. Such an amendment was reported by the committee. When it came up in regular order, Senator Sherman moved to substitute the sum of $425,000 in order to have done with the whole business, as he believed that it would be cheaper in the end, and that it would save the principle of arbitration from a damaging blow. Mr. Sherman's motion was supported by Senator Platt in a moderate tone and by Senator Hoar vigorously. At this critical moment the Jingo Senator from Alabama (Morgan) arrived on the scene. He had been absent when Senator Cockrell reported the $50,000 amendment

for the Court of Arbitration. Morgan at once began speaking against both propositions and in favor of an entirely new plan, that of a congressional investigation of the claims. In the course of this speech he reached the limits of Jingoism by accusing Great Britain of an intention to pay the money out of her own pocket in order to establish a moral claim on us for the money at a future time. When Senator Cockrell saw that this dreadful man was going to talk the session out, he cut the matter short by withdrawing his own amendment, which carried with it the Sherman amendment. So we stand before the world with a distinct blot on our 'scutcheon. We have not only refused to pay the sum which our own Government judged to be reasonable, but we have refused, or at all events failed, to take the next step, which we agreed to take. We promised in the most solemn manner to do one of two things, and we have not kept the promise. This may be high fun for the Jingoists; but Americans who visit Europe this year will perhaps not carry their heads quite so high as they usually do.

The latest champion of bimetallism in the English Parliament, Mr. Everett, amused the House of Commons much the other day by enforcing and illustrating the mystic character of silver and the divine purpose in lodging it in the earth. This sacrosanct nature of silver has been abundantly described already. In 1873, when the silver agitation first began, it was asked with much force, Why did the Hebrew patriarchs use silver in their daily transactions? Why, for instance, did Abraham pay for the cave of Macpelah in that metal if its use was not divinely ordained? And it has been more recently pointed out that, though the increasing spread of scepticism in the guise of science, falsely so called, has made its rôle in Hebrew history seem of less account, nevertheless a decent regard for ancient traditions and sacred beliefs requires that it should still be treated with a certain reverence. Mr. Everett undertook to show, and showed, that it is not necessary to rest the claims of silver to this reverence on the Bible or the Talmud; that its place in the currency of the world is part of the order of nature; and that in trying to make it a subsidiary coin, or throw it out of circulation, we are fighting against the forces of the universe. For says he:

> "The two metals [gold and silver] had been linked together in the speech of man and had been devoted to the same common use. There was a remarkable duality in nature. Red wheat and white wheat was used for a common purpose. The Creator had given us two eyes for the common purpose of sight and two ears for the common purpose of hearing, and we were created of two sexes [laughter], which only fulfilled the highest functions of their being by union in marriage."

He might have pursued the analogy much further had it been necessary. Two feet, two hands, the common use of horses in pairs, two oxen to the plough and the wagon, twins among children, two paddles to steamers, brown and loaf sugar, domestic and imported clothing, bicameral government, are all proofs that duality runs through nature with an unceasing purpose.

The Spanish Government was interpellated in the Cortes on Thursday respecting the attitude of the United States towards the Cuban revolt. In reply it was stated that our Government was faithfully discharging its duties as a neutral, and was, in fact, taking extraordinary precautions to prevent the organization of expeditions in this country to assist the Cuban revolutionists. All this is as it should be, yet it is no wonder that some Spaniards are ready to question our good faith. Senator Call of Florida introduces a resolution every year to annex Cuba. He does it, it is true, with a wink to the Key West cigar-makers, but the wink is not visible across the Atlantic. Senator Lodge chooses this happy occasion to say that Cuba will soon "become a necessity to us." This is the language of a highwayman, to whom the traveller's purse is equally a "necessity," and is to be had by means as honorable as those Lodge seems to have in mind. But the Spaniards do not understand that the grave Massachusetts Senator thus advocates international piracy with his tongue in his cheek, despising the silly voters whom he thinks to fool by his braggart words. With all the raging of the reckless Jingo press and our valiant Senators, it is reassuring to know that the Administration has no sympathy with filibusters or buccaneers. Whether the same could have been said of the Administration four years ago is highly doubtful.

A new argument for French colonial enterprises has been found. They are to fill up the rapidly decimating ranks of French servants. "Will you tell me," said a minister a few days ago to one of the most renowned of France's African soldiers—"will you tell me what good your Sudan is ever going to do us?" "Certainly," replied the general; "it is going to furnish you, twenty years from now, with the only people who will deign to black your boots or cook your meals." It is no doubt true that the servant question is getting to be almost as burning in the land of a fixed social hierarchy and traditionally well-trained domestics as in happy-go-lucky America. We have seen letters of great Spanish ladies complaining of the sudden insolence of their ancient retainers; the wail of the poorly served is audible in France, and what sort of democratic bees are buzzing in the heads of English servants may be inferred from such realistic pictures of them as 'Esther Waters.' The new French idea of meeting the difficulty seems likely to be the next resort of distressed civilization. It was anticipated some years ago by a comic paper which pictured the coming servant in the person of the Esquimaux maiden who would not object to sleeping in a cold room, the Zulu damsel who wouldn't mind a heated kitchen, and the other *Calibans* and *Audreys* of the ends of the earth who would fardels bear and groan and sweat in our behalf. But it is clear that this remedy could be only temporary, as the passion for equality and fraternity would surely, in time, reach and pervert the blackamoors as it had their predecessors before them. Whichever way we look at it, the future for civilized man looms dark and servantless. Sir William Harcourt told lately of a duke whose affairs were in desperate shape and who got a man to look into them. It was found that he had three high-salaried French chefs, and it was suggested that he might get on with two. But the duke rebelled, and plaintively said to his creditors: "Surely, you will let me have a biscuit when I want it." As things are going we shall all have to be content with a biscuit or a crust before long, as the trouble is swiftly spreading in all ranks of society, from a dustman down to a duke, as they now say in Parliament.

The reply of Prince Hohenlohe to the Reichstag on the subject of a new silver conference was made in writing and was very carefully worded. "Without prejudicing," he said, "our imperial currency, one must confess that the differences in value between gold and silver continue to react upon our commercial life. Following out the train of thought which led to the convocation of the Silver Inquiry Commission, I am ready to consider, in conjunction with the federal governments, whether we cannot enter into a friendly interchange of opinions as to common remedial measures with the other states which are chiefly interested in maintaining the value of silver." This, as the London *Economist* points out, is in no sense different from the position taken by Germany in the Brussels conference, for, although she declined to take part in the discussion or the voting in the conference, she might have taken part in both, as England did, without changing her determination to adhere to the gold standard. The situation in Germany is this: The landowners are in despair because prices of cereals are low. They think that a change in the standard of value might help them. The manufacturing and commercial classes, whose products fell in price some years ago, are now well pleased to see the prices of agricultural products come down. They are opposed to any tinkering with the currency. The Government is not obliged to do what the Reichstag wants any more than President Cleveland is obliged to do what the House of Representatives wants. It should be observed that President Cleveland is not authorized, in any event, to take part in a new conference for "a friendly interchange of opinions," but only for one to take positive steps for international bimetallism.

PARTY DISCIPLINE AND APPROPRIATIONS.

THE customary wrangling and recriminations over the appropriations of Congress are now well under way. In the press and in the supplementary issue of the *Congressional Record*, one set of party leaders assert that they have been wise and economical, while also patriotic and generous, in voting money for Government purposes, while another set assert that the appropriations were never so extravagant and wasteful, and at the same time so poorly adapted to make the country great and majestic at home and abroad. Chairman Sayers affirms, and adduces the figures to prove, that the appropriations of the Fifty-third Congress were below those of the Fifty-second by $36,000,000, and below those of the Fifty-first by $45,000,000. On the next page Mr. Henderson, for the minority, affirms, and adduces *his* figures to prove, that the appropriations of the Fifty-third Congress were greater than those of the Fifty-first by $31,000,000.

There is nothing new about this, and we refer to it only because it exemplifies once more the state of hopeless chaos in which American public finance continues to flounder. Nothing like it is to be seen in any other civilized country. One set of men are put to the work of levying taxes to raise the public revenue, and another set, separate and irresponsible, vote it away. The first set are not allowed to lay revenue taxes pure and simple, and if they were, would not know how much money to provide, as there is no way of guessing in advance how much money will be spent. The set nominally in control of the spending—that is to say, the chairmen and the majority members of committees—are not really in control, as they are subject to constant raiding and overruling by the mob of log-rollers and grabbers into which the House always resolves itself in the last two weeks of its life.

This was especially conspicuous in the last hours of the Fifty-third Congress. Chairman Sayers and his faithful lieutenant, Mr. Dockery, protested and appealed, stormed and threatened, but all in vain. Party lines went to pieces, and the responsible leaders of the House were ridden down again and again as by a charge of infuriated bisons. Notably was this the case with the sugar-bounty vote. Mr. Dockery put the case as strongly as possible. The Government revenues were short $110,000,000. To sustain the gold reserve $150,000,000 of bonds had been issued. Yet in this fiscal situation the House was coolly asked, in the closing hours of the last day of the session, to vote away a gratuity of $5,238,000. The strongest leaders on both sides were against it. Mr. Reed was against it, and Mr. Cannon and Mr. Payne—that is, the next Speaker, the next chairman of the appropriations committee, and possibly the next chairman of the ways and means committee. But the gratuity was voted in a mad rush, the most telling, and at the same time the most shameless, argument in favor of it being made by Mr. Beckner of Kentucky, who said:

> "I know, Mr. Speaker, how prone the public men of the South have been to construct out of material claimed to be found in the Constitution breakwaters against the gulf stream of governmental expenditure, so that its warmth and vivifying powers may be confined to the North, but in this case all sections are interested; and, while it is on my mind, let me warn my Southern friends that they can overdo what in a remarkable degree would be highly commendable. The younger generation are looking with eager eyes and yearning hearts on the industrial and commercial movements which have made the East, the Middle States, and even the new West so prosperous and rich. They are impatient over the quibbling about constitutional phantoms which obstructs the development of the dear South land for which nature has done so much."

It should be noted, too, that the evil is a growing one, and that the old barriers in the House and Senate rules against the warm and vivifying gulf stream of governmental expenditure have been deliberately broken down. When the chairman of the appropriations committee had complete charge of all appropriation bills, he was able to make a better fight against the spendthrifts. Mr. Randall was for years, as such chairman, the terror of jobbers and schemers, and used, in fact, to be able to keep something like unity and reason in the system. He could say with a good measure of truth, as he did at the close of the Forty-sixth Congress, that "every description of undue appropriation of public money has been prevented." But the jobbers and the schemers soon put an end to that. In 1883 the river and harbor committee was given a free hand for its log-rolling raids upon the Treasury, and, pleased with the results of that move, the yearning and eager seekers after appropriations succeeded, in 1886, in taking away from the appropriations committee the army bill, the naval bill, the consular and diplomatic bill, the post-office and Indian bills. Is it surprising that the expenses began to leap up? A similar throwing down of the bars is now proposed in the Senate. Mr. Gorman used his power as member of the committee on appropriations to strike out some $3,000,000 from the wasteful naval bill, and instantly a Senator gave notice that he should move to have the appropriation bills broken up in the Senate as they have been in the House. Divide and conquer, is the motto of the raiders.

To state the perils of the system at their worst, it must be added that the old motives for public economy are disappearing or have disappeared. Said Mr. Dockery, when protesting against one particular largess:

> "If I read aright the public sentiment of the country as it is reflected in the daily press, if not on this floor, the people of the United States will call to a severe account their representatives who, in times of pressing distress, with thousands of laborers out of employment, with widespread industrial paralysis, approve the policy proposed by this bill."

But he was very much mistaken. There is no evidence of a widespread desire for frugality in government. The hard times are only a new argument for lavish appropriations—the more needy people there are, the greater the call for warm and vivifying sums out of the public treasury. The Governors of half-a-dozen States have had to send special messages to their Legislatures this year warning them against the alarming extravagance of the appropriation bills. Provided a fair share of the swollen appropriations reach the eager and yearning in his district, a Representative will get but the warmer welcome from his constituents if he goes home with a consistent record for approving public extravagance.

But while this is so, the urgency of devising some means to prevent legislatures and Congress from bankrupting the country is great, on partisan as well as patriotic grounds. No party can safely see its leaders in the House trampled upon by a mob of needy and unprincipled jobbers. The numbers of the latter are all the while increasing, as are also their audacity, their skill in conspiracy and intrigue. As a measure of self-preservation, then, party leaders must find some way of keeping them under. A thorough-going remedy it is idle to hope for. To ask irrational men to adopt a rational system is to cry in the wilderness. Other civilized governments themselves take exclusive charge of revenue and appropriation bills. To suggest that at Washington would have no more effect than an east wind blowing over the capitol. Equally futile is it to talk of amending the Constitution so as to allow the President to veto separate items in an appropriation bill. That method works admirably in many State constitutions, but that would be an argument against it with the Washington politicians.

A tentative and practicable remedy might be found in extending party discipline to appropriation bills. They might be settled in a party caucus, and subordination required to the responsible chairmen as a test of party loyalty. This is done now in the matter of electing a doorkeeper or a chaplain, or of passing some partisan bill; why should it not be done in the matter of conducting the public finance? A precedent in point could be found in the government of towns in some States, where the sums to be voted for town expenses are settled in party primaries and then submitted to the voters. The appeal should be made to party responsibility and party discipline; that is often practicable where an appeal to reason and experience is not. In some way American parties must take in hand our headless finance. Their own existence as well as that of the Government is threatened by the increasing throngs of lobbyists and log-rollers who sit in Congress in the guise of legislators, and

whose swinish rush for public money is becoming more disgusting and dangerous year by year.

A SILVER PARTY.

An address has been signed and published calling for the formation of a new party, whose principal aim shall be the "immediate return to the constitutional standard of gold and silver, by the restoration by this Government, independently of any foreign power, of the unrestricted coinage of both silver and gold into standard money, at a ratio of 16 to 1, and upon terms of exact equality; the silver coin to be a full legal tender, equally with gold, for all debts and dues, public and private." The signers declare emphatically that there is no dependence to be placed on either of the old parties. On this point they say:

> "There is no hope whatever that the Republican party, as a party, will change its policy, give up the gold standard, and restore the bimetallic standard. The Republican party is committed by its leaders, by its record, and by the press behind it, to the gold standard, supported by gold bonds, and to the retirement of the greenbacks and the surrender of the issue and control of paper currency to the banks."
>
> "No less persistent and effective is the control of the money power over the organization of the Democratic party. While undoubtedly a large majority of the members of that party are opposed to the gold standard, they have been powerless to control the party organization against it, and much less to secure through it the restoration of the bimetallic standard."

Another address has been issued simultaneously, signed by R. P. Bland, W. J. Bryan, and twenty-nine other Democratic members of the last Congress who have failed of reëlection, urging all Democrats to make the money question the paramount issue, and to endéavor to place the Democratic party on record in favor of the "immediate restoration of the free and unlimited coinage of gold and silver at the present legal ratio of 16 to 1, without waiting for the aid or consent of any other nation, as it existed prior to 1873; such coin to be a full legal tender for all debts, public and private."

This is a political programme that we have ardently desired to see carried into effect. It is now nearly twenty years that the country has been harassed, and political parties wrenched, and the national resources wasted by the silver question. This question has been only a side issue, but has nevertheless embarrassed both parties from the beginning. It has embarrassed the Democrats more than the Republicans, and is likely to embarrass them in still greater degree. A considerable number of leading Democrats are now in favor of an outright declaration for free coinage in order to head off the new party. The Republican silverites are not of this desperate kind. Of the Colorado and Montana members it may be said that their bark is worse than their bite. They will threaten and bluster up to a certain point and then they will surrender. Such Senators as Teller and Wolcott have no idea of disrupting the party. In this particular they are squarely at issue with the Nevada Senators, who are already members of the new party. The proposition for another monetary conference came from Wolcott and was stoutly opposed by Stewart, who described it as a new attempt to dodge the issue and to stave off a decisive battle in this country for free coinage. We think that Stewart's diagnosis is the true one, and that it applies to both parties alike. The eagerness with which the Democrats welcomed it was quite suspicious.

Now the interesting question is whether Bland, Bryan, and the other tailless foxes can make a sufficient break into the Democratic party to make it an out-and-out silver party, or whether they will merely succeed in attaching themselves to the Populists. In the latter event they will be stigmatized as deserters and their career will be short. Mr. Bland's maximum achievement will be to deliver the State of Missouri over to the Republicans, and not only to fail of the senatorship himself, but to defeat Vest also. This result is as likely to take place in 1896 as any really doubtful thing in the range of politics. Mr. Bryan has accomplished the same thing in Nebraska, but it was an easier thing to do, because that State is naturally Republican.

One way or the other—either by putting a new party in the field or by putting the Democratic party on a free-coinage platform—it is to be hoped that the issue may be squarely made in the next Presidential election. The question must be fought out. The old dodges and devices of buying a little silver to stop the mouths of a few people will no longer serve the purpose. It is time that the people should say whether they want a fifty-cent dollar or not. It is time that they should say it in plain words, and not by obscure phrases in national platforms and by nominating men whose positions are known just as Mr. Cleveland's was known in 1892, and as Mr. Bland's is known now. An attempt will be made by the "boomers" of McKinley to push the tariff to the front, but it will hardly succeed, because the tariff is not the uppermost thought of the people, and because the position of McKinley on the silver question would expose the party to losses in the Eastern States. Everything points now to the kind of battle which the silverites have issued the challenge for. Let us hope that it may not be postponed beyond 1896.

JOURNALISTIC DEMENTIA.

The effect of wealth on the journalistic mind is a subject of considerable pathological interest which we commend to the attention of the Academy of Medicine. The condition of excitement into which the press has been thrown during the past fortnight by the marriage of one rich woman and the divorce of another, in fact seems hardly distinguishable from a species of dementia. Unlimited space is given up to both events, and the illustrations include portraits of the entire families of the plaintiff and defendant in the divorce suit, and of the various houses which they inhabit. The particulars of the divorce suit, too, are discussed in one paper as the "biggest divorce suit ever known in the world," and pointed out as particularly interesting to the brakemen on a railroad from which one of the parties draws his income. It must be remembered, too, that this stuff is greedily read by all classes; and if we were to infer the character of the population from its consumption, using the standards supplied by ordinary life and by other kinds of literature, we should say that the United States was inhabited exclusively by servant-girls, 'longshoremen, and hackmen. Upon the effect of such compositions on the youth who are pouring out every year from the common schools we need not comment. This is probably not yet fully visible, but it will become more and more so as the years roll by.

It is not their indecency that is their worst fault; it is their unutterable silliness and vulgarity. One who knew no better might fairly imagine that a lot of vicious boys had got hold of the press, and were amusing themselves with bringing civilization itself into ridicule. The most marked feature of these compositions, in fact, is their puerility. Nobody who was not accustomed to them would suppose they were the work of grown-up people. Childish hilarity, irreverence, and, we may add, childish inventiveness, are their leading characteristics.

What is most curious about this press problem is, however, that it is apparently insoluble. The silly youths who run this great machine—only a handful, after all, in number, and objects of more or less ridicule when they show themselves *in propriâ personâ*—seem to hold this great nation in a kind of slavery. The press is, to the vast mass of the town population, at all events, an object of dread and dislike. We have heard denunciations of its mendacity and inquisitiveness from people of all classes and conditions. But no mission set before the American people seems more hopeless than escape from it. The exclusion of the British from this continent, the provision of a sound currency and good banking system, the purification of the suffrage, and the abolition of the spoils system, all seem easy and practicable compared with the reform of the press. Clergymen preach about it, magazine writers write about it, and it is a common topic of conversation at nearly every social gathering in the land. There is hardly any one, rich or poor, who has not suffered from "the newspapers," and especially those who have passed through some notorious sorrow or misfortune. Travelling Americans hang their heads for shame when they see an American newspaper in a foreign reading-room. They hang them still lower when it is thrust into their hands on the wharf when they return to their native land.

But nobody seems able to suggest any

remedy, and, what is worse, the grumblers over the wicked journals are often their most diligent readers. One too often finds that the bitterest denouncers of the bad newspapers are familiar with everything they contain every day, repeat their gossip, enjoy their "digs," and especially the bits of blackguardism with which they annoy decent people. Here is the root of the evil. There is no surer reflex of the popular taste than journalism. It may be asserted that every country has the kind of newspapers it calls for. It is through this cranny that the proprietors of blackguard newspapers effect their escape. They say they furnish only what the community calls for, and show their "sales" and their fortunes in proof of the statement. Of course there is always a certain action and reaction going on between the public and the press. The press in some degree creates the tastes which it gratifies, and the journalist's plea that he only publishes what he knows he can sell, might be set up by the vender of obscene literature. But the main fact remains that the public gets the kind of press it wants, and which it could kill or discourage if it chose.

For the press there are certain excuses which, while they do not solve the problem, are worth consideration. Fewer and fewer able young men go into it as a calling, owing to the absence of all prizes in it and the insecurity of tenure. It is recruited largely by men who shrink from the early drudgery of the regular professions, or desire to step rapidly into a salaried place, or enjoy the variety and excitement of a journalistic life, or the power of secretly bombarding or annoying their seniors. Most of these men begin in the reporters' room, which, as generally managed, is the grave of seriousness and truthfulness and high ambition. Moreover, the proprietors, in catering for a salacious and frivolous public, as they consider it, do not encourage young men who are burdened with thoughtfulness or attainments. They want the livelier, more unscrupulous and imaginative kind who "write up" the divorce cases and pursue the rich into their bedrooms. Yet it is from the ranks of these youngsters that the editorial places are filled, and by the time the young journalist reaches his place he is apt, in good truth, to look on the world as a stage, and the men and women on it as bad actors, and humanity itself, with all its hopes and fears, as simple "copy." It will thus be seen that the press problem is mainly an economical problem. No other calling would be better off which offered no more prizes or security, and in which personality was so completely suppressed, and tyros enjoyed power in no way dependent on their experience or capacity.

THE PROGRAMME OF THE UNIONISTS.

THE combination of Tories and seceding Liberals in England, commonly known as the Conservative party, shows a disposition to change its name. Many of its members now habitually speak of themselves as Unionists rather than as Conservatives, and it must be admitted that the latter title has ceased to be altogether appropriate. It is true that this party may claim such conservatism as is implied in the maintenance of the House of Lords, the Established Church, and the present terms of union with Ireland; but the welfare of society consists of weightier matters than these. Concerning these weightier matters there are now decisive indications that the Unionists are about to offer to the country a policy so far removed from conservatism as to make it obviously expedient and becoming to drop the name.

This is manifest from the recent utterances of Mr. Balfour in commendation of Mr. Chamberlain's scheme of social reform. It is even more positively established by the declarations of the Duke of Devonshire, a statesman hitherto distinguished for moderation. Mr. Campbell-Bannerman, he said, had objected to the new Unionist policy of social legislation that no one could tell that the Unionists were all agreed. "We are all agreed," said the Duke. "There is not one of the great national interests at the present moment in the condition in which we could wish it to be. Agriculture, after all, our greatest national industry, has never been in such a condition of depression, and manufactures and industrial interests are rapidly sinking into the same condition. The mining and manufacturing interests of this country are gradually sinking. . . . We ask Parliament to address itself to the task of considering measures for the improvement of the condition of the people—measures which need not necessarily injure a single man, rich or poor, but which we hope may and will produce some improvement in the condition of the poorest and most suffering of our fellows."

He must indeed be hard-hearted who would refuse to benefit his fellow-creatures in this inexpensive manner; but the practical question, how this can be done, at once suggests itself. The Unionists, it seems, have now agreed upon their answer to this question. There are three principal measures by which they propose that Parliament shall improve the condition of the poor. The first of these is a system of old-age pensions, the Government furnishing money to encourage workmen to accumulate their savings. The second measure is to secure to workmen as a matter of right "that in all cases in which they suffer from accidents or injuries received in the course of their employment, they themselves and their families shall be fairly provided for." This provision is to extend to injuries due to a man's own fault. And the third measure provides that Government shall advance money to workmen to enable them to purchase dwellings.

As to the second of these measures, as we understand Mr. Chamberlain's explanation of it, employers are to be required to provide for workmen who are injured in their employment. In view of the sinking state of all English industries, as described by the Duke of Devonshire, it is incredible that employers can provide for this increased expense out of their profits. To say that these industries are sinking is but another way of saying that normal profits can no longer be obtained in them. If this is true, the additional expense to which employers are to be subjected can be met only by a corresponding reduction of wages. The measure would therefore be properly described as one for compelling workmen to insure themselves against accident. It would be interesting to observe the reception of such a programme as this by the English workman, but it is improbable that the matter will be presented to him in this way. He will be assured, more or less openly, that the rich are to be made to pay for his insurance, and that they ought to do so. While there is nothing more laudable than the prudence and regard for others displayed by the man who sacrifices a portion of his enjoyments in order that he may insure against casualty, no civic virtue is promoted by compulsory almsgiving. It curses both him who gives and him who takes. If the scheme contemplates insurance by Government, it will give rise to as much fraud as our pension laws. Those who are familiar with the business of insurance will testify that the greatest vigilance is necessary in order to prevent the companies from being ruined by fraudulent claims on the part of the assured. Against such claims no government can be defended with any degree of success. Shocking as it seems, it appears to be true that large numbers of people are willing to mutilate themselves for a pecuniary consideration.

The system of governmental insurance against injuries is also open to the criticism which applies to the other two measures. If Government is to pension old people and to lend money on real estate, it can procure the means to do so only by increasing taxes. If these taxes are paid by those who get pensions, it is evident that they are compelled to sacrifice a part of their wages for this purpose, as well as an additional part to cover the waste and expense of the tax-gatherers and disbursers. As it is contended that workmen are unable to save sufficient provision for old age out of their wages, it is evident that the advocates of this scheme really contemplate getting these taxes out of the pockets of those who are not to receive its benefits. In a word, pensions are either to be paid for by those who get them, in which case the scheme is simply one of compulsory insurance, or, since this supposition is excluded by the assumption that workmen are not able to save for this purpose, they are to be paid for by the rich. It can hardly be regarded as self-evident that such measures "need not necessarily injure a single man, rich or poor." They have a potentiality of mis-

chief far beyond what can be here indicated.

In our judgment the Unionist programme would be greatly improved if it were reduced to one single measure. Let Parliament simply pay to every workman a daily or weekly stipend amounting to one-third or one-half of his wages. This would enable workmen to provide pensions, accident insurance, and dwellings for themselves, and such provision might be made compulsory. Moreover, as the Unionists argue, this would have no tendency to discourage providence and industry, since they defend their own measures on the ground that they are meant to "help" men to save; the theory being that public almsgiving can do no harm to those who are able to earn something for themselves, provided, of course, the gift is not called alms. We are very well aware that this experiment was formerly tried in England. All industries, that of agriculture especially, were then "rapidly sinking," and it was decided that the insufficient wages of the poor should be supplemented by allowances out of the rates. It is true that experience proved that this measure had the effect of reducing the rate of wages by the amount of the allowance, so that the workman received no higher wages than before; and if we were to be guided by experience, we could not escape the conclusion that the measures now proposed will have the same result. But modern legislators appear to have little interest in the lessons of experience, and even in England, the home of conservatism, the conservative spirit is, for the present at least, overborne. We cannot but regard it as ominous that this country, which maintained and gave to the world the great principle of resistance to governmental encroachment upon the liberties of the subject, should be threatened with socialistic oppression. As to the Unionists, it is in the highest degree discreditable to them that they should be willing to seek power by surrendering the defences of society to the Radicals.

TOWN GOVERNMENT IN MAINE.

BRUNSWICK, March 6, 1895.

THE best examples of the old form of town government in New England are naturally to be found in those communities which, in virtue of their small population and remote situation, stand somewhat aside from the great industrial and social movements of the time. It is amid such surroundings that the traditions of the elders are most faithfully preserved; and it is this type of community which has most often been described. There is, however, a type of town government different from this, to which much less attention has been given, yet which has in some respects a greater interest for students of political institutions. It is represented by those towns which, with population and wealth sufficient, according to the usage of the State in which they are situated, to entitle them to incorporation as cities, still keep to the old form of government in many of its essential details, and with no manifest desire to exchange it for another. Though in important respects primitive social conditions have given way to the demand for modern necessities and conveniences, the modifying influence of increasing numbers and diversified interests has as a whole been quietly and successfully resisted. Such a town is on the one hand far removed, in most of its characteristics, from the simple country community; on the other hand, it is not yet overgrown, and the town meeting, the governing body, has not yet been broken down by the presence of a body of voters too large for orderly and concerted action.

Such a town is Brunswick, Maine. First settled in 1628, and incorporated as a town in 1738, it has for the past fifteen years enjoyed the distinction of being the most populous town in the State. Like most of the seacoast towns of Maine, it is of very irregular form, with an area of perhaps fifty square miles. Of its six thousand inhabitants, one-third are French Canadians, drawn hither by the various factories and mills which have grown up about the falls of the Androscoggin. All but about five hundred of the inhabitants live in "the village"; and there is almost no foreign population other than the French. In 1894, the valuation of the town, "full, fair, cash value," as the annual reports take pains to state, was $3,514,436; the ordinary town expenses for the same year were $57,120, one-fifth of the taxes being paid by the corporations doing business in the town. "The village" is provided with water, gas, and electric light, and a sewerage system is being constructed. The public schools (the French children largely attending a parochial school), including a free high school, are among the best in the State; and there is a free public library of about six thousand volumes. The voters number about twelve hundred, although of the two thousand French less than a hundred and fifty vote. The three hundred and forty-five students of Bowdoin College add a considerable temporary population for several months in the year; and probably not far from $100,000 is annually expended in the town by the students and others connected with the college.

Although having a larger population than any other town in the State, Brunswick shows no desire to become a city. At least three attempts in this direction have been made, the last being in 1892; all have failed. There are but twenty cities in Maine; eight of these had each in 1890 a smaller population than Brunswick, and one of the remaining twelve exceeded it by only sixty-three. There are, of course, those who would prefer to see a mayor and council displace the selectmen, but with the great majority of the people the present conditions are entirely satisfactory. Yet it is manifest that the community presents, in population, industry, and wealth, many of the conditions which characterize the smaller cities of New England, and which are often thought to make a city organization, if not necessary, at least more effective. I looked forward, therefore, with interest to the annual town meeting, in which the business of the town for the coming year was to be discussed and arranged.

The annual meeting this year came on Monday, the 4th of March, and at a quarter before nine o'clock the bell on the town building rang out its summons to the citizens. The town hall is a large and not unattractive room, with a gallery in the rear, and the usual scenery and footlights on the stage; it will seat a thousand people, and has to do duty for all sorts of public assemblies. The day opened cold and blustering, and when, promptly at nine o'clock, the town clerk mounted the stage and began the reading of the warrant, there were exactly fifty people scattered about the room. The reading finished, ballots were taken for moderator and town clerk. The first of these officers received six votes, the second ten. Both were declared elected, and at once administered the oath to each other. The moderator was a prominent lawyer of "the village," and presided throughout the day with ability and acceptance. A short prayer by a retired minister resident in the town followed, and then the important business of the forenoon, the election of town officers, began.

During the previous week Democratic and Republican caucuses had been held, and had put in nomination lists of officers which were identical except in the three candidates for selectmen (one most commonly hears of *selectmen* in Brunswick). An attempt to organize a citizens' caucus had failed, although a "split" ticket appeared on Monday. Neither of the caucuses was largely attended, nor were the leading citizens very numerously represented. On Monday "straight" tickets seemed to be the rule. The polls remained open until one o'clock, at which time 712 votes had been cast. The number of votes was 114 less than last year; but this year no special effort was made to secure a large vote, and the cold weather doubtless kept away many from the country. Within the hall everything went on in a quiet and orderly manner. But few of the voters remained after depositing their ballots, though a few of the older men, some of them as genuine rustics as one could wish to see, sat on the hard benches the greater part of the forenoon, attentively studying the reports of the town officers and school committee, which had been printed in neat pamphlets and distributed. I formed the impression that these reports were more widely and carefully read than are similar documents in the smaller cities. Nearly every man I met had copies, and I heard them discussed in shops and stores, in the post-office and at street corners, as well as in the town hall.

The only offices over which there was any contest were those of selectmen, and here the Republican nominees won. The selectmen serve also as assessors, overseers of the poor, and surveyors of highways. The other principal officers—treasurer, collector, auditors, town agent, town clerk, and school committee—are usually reëlected year after year, following the good old New England custom. The "village" naturally gets the larger share of the offices; this year it has two of the three selectmen, all of the school committee, and all the other offices mentioned above except the town agent, an officer whose duty it seems to be to care for the legal interests of the town. As the compensation of the town agent last year was only $10, it may be inferred that his duties are neither numerous nor burdensome. I was told that it was customary to choose the moderator from the village, and that several of the college professors had at various times served in that capacity.

The popular interest of the day centred in the afternoon session. The voters were reinforced by a large number of students from the college and high school, who crowded the rear of the hall and watched the proceedings with evident interest. The moderator displayed considerable skill in expediting business, ten of the twenty-five articles in the warrant being disposed of in less than an hour. Most of the minor town officers were given another term, among them the time-honored measurers

of wood and bark, surveyors of logs and lumber, fence-viewers, fire-wardens, and surveyor of shingles and clapboards. This part of the proceedings called out but little discussion; indeed, the vote on the adoption of each article was in most instances scarcely audible. The usual appropriations for town expenses were made without opposition, the amounts voted being in two or three instances in excess of those suggested in the annual reports. A statement from the public-library association to the effect that the appropriation of last year would need to be doubled this year if the library was to remain free to all residents of the town, was favorably received, and the amount asked for, one thousand dollars, was promptly voted. The library was made free only a year ago, and an increase from one hundred to nine hundred in the number of persons taking out books was convincing proof of popular satisfaction with the experiment.

One item of business before the meeting was "to see if the town will vote to accept a U-shaped town-way over land of D. B. Blethen on the west side of the Twelve Rod Road." The moderator explained that the way in question was not shaped like the letter U, but in reality formed three sides of a rectangle; and in proof he displayed a small plan of the locality. The acceptance of the road was achieved without opposition, and the next article was about to be taken up, when some one raised the momentous question as to what and by whom the new road was to be named. It then appeared that there were three streets in the locality, which the owner of the land had expressed a desire to name respectively Columbia and Belmont Streets and Central Avenue. A dignified gentleman was moved to ask the length of the street which it was proposed to call Central Avenue; and on being told that its length was twenty rods, provoked loud applause by remarking dryly that the proposed name seemed to him "somewhat ambitious." The town finally decided to name the new highway South Spring Street, because it was in line with a Spring Street in another part of the town, which might some day be extended.

Under the influence of the discussion over the new road the hitherto rather frigid assembly had thawed perceptibly, and began to show interest in what was being done. One or two requests for electric street lights were granted, the town listening attentively to brief arguments by several men who "drove a good deal," to the effect that several accidents had occurred either from the absence of lights at the points named, or because existing lights were badly placed. One light asked for was granted on the statement of the deputy sheriff that the locality was "a hard place," and that an electric light would make things easier for the town police—a suggestion which seemed to imply the existence of an embryonic slum.

The interest of the meeting reached its climax in connection with the proposed discontinuance of the liquor agency. Under the Maine liquor law, each town or city may, at its discretion, establish an agency for the sale of liquors for medicinal, scientific, and mechanical purposes. In 1894 the town meeting voted to request the selectmen to establish an agency in Brunswick, the town having been for several years without one; the agency was accordingly opened, and the annual report showed sales for the year amounting to $1,700. The reading of the article in the warrant referring to the agency was hardly finished before a loud chorus of voices burst forth, and half-a-dozen men were on their feet calling for recognition. The minister who at the morning session had thanked God for the "high moral character" of the town, obtained the floor, and, producing a manuscript, read from it a vigorous denunciation of the liquor traffic in general and the agency in particular; but his rhetoric and enthusiasm played havoc with his argument, for he presently dropped the subject of temperance, and devoted the larger part of his address to a glorification of Brunswick, Bowdoin College, and the chief justice of the United States. Although listened to with impatience, and frequently interrupted by applause from the crowd in the rear of the hall, there was nevertheless no disposition to deny him the right to speak as long as he chose. The short speeches in rebuttal were rather the best of the day, the last speaker, a blind man, bringing down the house as he urged his demand for an agency on the ground that he was tired of being lied to by all the druggists in town. The article of the warrant was adroitly worded: it was "to see if the town will vote to discontinue the liquor agency"; and there was doubt among some of those present as to the precise effect of a vote not to discontinue, since the maintenance of an agency is optional with the selectmen. The moderator was interrogated, but vouchsafed only evasive answers. By an overwhelming majority the town voted not to discontinue the agency. The episode illustrated very well the unfortunate tendency to make the mention of liquor the occasion for joke and jest, and also the plain wish of the people for a place at which liquor could be legally purchased.

I was disappointed in the general character of the public speaking throughout the day. With one or two exceptions, none of the speaking was good, and most of it was noticeably poor. Of course, no one nowadays would look for oratory in a town meeting; but the speaking on Monday was distinctly inferior, in simplicity, readiness, and effectiveness, to what may be found in many smaller communities. In this respect, at least, the old order has passed away.
